## DEPARTMENTAL EDITORS

ELMER E. BROWN, PH.D., LL.D. . . . .	President of New York University.	HIGHER AND SECONDARY EDUCATION
EDWARD F. BUCINER, PH.D. . . . .	Professor of Education and Philosophy, Johns Hopkins University, Baltimore, Md.	BIOGRAPHY, PHILOSOPHY
WILLIAM H. BURNHAM, PH.D. . . . .	Professor of Pedagogy and School Hygiene, Clark University, Worcester, Mass.	HYGIENE
GABRIEL COMPAYRÉ . . . . .	Inspector General of Public Instruction, Paris; Member of the Institute of France.	EDUCATION IN FRANCE
ELLWOOD P. CUBBERLEY, PH.D. . . . .	Head of Department of Education, Leland Stanford Junior University, Stanford University, Cal.	EDUCATIONAL ADMINISTRATION
JOHN DEWEY, PH.D., LL.D. . . . .	Professor of Philosophy, Columbia University, New York City.	PHILOSOPHY OF EDUCATION
CHARLES H. JUDD, PH.D., LL.D. . . . .	Director School of Education, University of Chicago, Chicago, Ill.	PSYCHOLOGY
ARTHUR F. LEACH. . . . .	Charity Commissioner for England and Wales, St. James, London.	MIDDLE AGES, REFORMATION
WILL S. MONROE, A.B. . . . .	Professor of Psychology and History of Education, State Normal School, Montclair, N.J.	BIOGRAPHY, AMERICAN
J. E. G. DE MONTMORENCY, M.A., LL.B. . . . .	Barrister-at-Law, London; Assistant Editor, <i>The Contemporary Review</i> .	HISTORY OF EDUCATIONAL ADMINISTRATION
WILHELM MÜNCH, PH.D. . . . .	Professor of Pedagogy, University of Berlin, Berlin, Germany.	EDUCATION IN GERMANY
ANNA TOLMAN SMITH . . . . .	Specialist, Bureau of Education, Washington, D.C.	NATIONAL SYSTEMS
HENRY SUZZALLO, PH.D. . . . .	Professor of the Philosophy of Education, Teachers College, Columbia University, New York City.	METHOD OF EDUCATION
FOSTER WATSON, PH.D. . . . .	Professor of Education, University College of Wales, Aberystwyth, Wales.	ENGLISH EDUCATIONAL HISTORY

## CONTRIBUTORS TO VOLUME II

- F. Sturgis Allen**, General Editor Webster's New International Dictionary. (*Dictionaries; Encyclopedias.*)
- James R. Angell**, Ph.D., Professor and Head of the Department of Psychology, University of Chicago. (*Psychology.*)
- Roswell P. Angier**, Ph.D., Assistant Professor of Psychology and Director of the Psychological Laboratory, Yale University. (*Psychology.*)
- L. D. Arnett**, Ph.D., Specialist in the U. S. Bureau of Education, Washington, D.C. (*National Systems of Education.*)
- Joseph Cullen Ayer, Jr.**, Rev., Ph.D., Professor of Ecclesiastical History, Divinity School, Protestant Episcopal Church, Philadelphia, Pa. (*Topics in Early Christian and Medical Education.*)
- Henry Turner Bailey**, Editor School Arts Book. (*Drawing.*)
- John Wallace Baird**, Ph.D., Assistant Professor of Experimental Psychology, Clark University. (*Eye Structure.*)
- Franklin T. Baker**, A.M., Litt. D., Professor of English Language and Literature, Teachers College, Columbia University. (*English; etc.*)
- Bird T. Baldwin**, Ph.D., Associate Professor of Education, University of Texas. (*Cranometry.*)
- John G. Bowman**, A.M., President of the State University of Iowa. (*Colleges and Universities.*)
- Edward F. Buchner**, Ph.D., Professor of Education and Philosophy, Johns Hopkins University. (*Educational Philosophers.*)
- Leo Burgerstein**, Ph.D., k.k. Professor, Privatdozent in the University of Vienna, Vienna, Austria. (*Hygiene of Coeducation.*)
- William H. Burnham**, Ph.D., Professor of Pedagogy and School Hygiene, Clark University. (*School Hygiene.*)
- Bailey B. Burritt**, A.M., Assistant Secretary, State Charities Aid Association, New York City. (*Distribution of College Graduates.*)
- Edward H. Cameron**, Ph.D., Associate Professor of Psychology, Yale University. (*Psychology.*)
- Alexander F. Chamberlain**, Ph.D., Assistant Professor of Anthropology, Clark University. (*Education and Crime; Eugenics.*)
- Percival Chubb**, Director, Society for Ethical Culture, St. Louis, Mo. (*School Festivals.*)
- Morris Raphael Cohen**, Ph.D., Instructor in Mathematics, College of the City of New York. (*Davidson.*)
- Percival R. Cole**, Ph.D., Vice-Principal of the Training College, Sydney, Australia. (*Froebel.*)
- Gabriel Compayré**, Inspector General of Public Instruction, Paris, Member of the Institute of France. (*Education in France.*)
- Ellwood P. Cubberley**, Ph.D., Professor of Education, Leland Stanford Jr. University. (*Educational Administration; State Systems of Education, etc.*)
- Alexander Darroch**, M.A., Professor of Education, University of Edinburgh. (*Scotch Universities; and Biographies.*)
- Henry Davies**, Rev., Ph.D., Rector, Easton, Maryland. (*Church Fathers; Coule.*)
- John Dewey**, Ph.D., LL.D., Professor of Philosophy, Columbia University. (*Philosophy of Education.*)
- Fletcher B. Dresslar**, Ph.D., Specialist, Bureau of Education, Washington, D.C. (*Desks; Disinfectants, etc.*)
- Knight Dunlap**, Ph.D., Associate in Psychology, Johns Hopkins University. (*Psychology.*)
- Edward C. Elliott**, Ph.D., Professor of Education; Director, Course for the Training of Teachers, University of Wisconsin. (*City School Administration; Educational Commissions, etc.*)
- Charles H. Farnsworth**, Associate Professor of Music, Teachers College, Columbia University. (*Dancing.*)
- Frederick E. Farrington**, Ph.D., Associate Professor of Educational Administration, Teachers College, Columbia University. (*French Educators, etc.*)
- J. J. Findlay**, Ph.D., Professor of Education, University of Manchester. (*Experimental Schools, etc.*)
- William T. Foster**, Ph.D., President of Reed College. (*American College.*)
- Shepherd I. Franz**, Ph.D., Scientific Director and Psychologist, Government Hospital for the Insane; Professor of Experimental Psychology and of Philosophy, George Washington University. (*Psychology.*)

CONTRIBUTORS TO VOLUME II

- Clyde Furst**, Litt.D., Secretary Carnegie Foundation for the Advancement of Teaching. (*Benjamin Franklin*.)
- Charles Galwey**, A.B., Tutor of English, College of the City of New York. (*American Colleges; Fraternities*.)
- Henry H. Goddard**, Ph.D., M.D., Director Department of Psychological Research, New Jersey Training School for Feeble-Minded, Vineland, N.J. (*Defectives*.)
- Evelyn M. Goldsmith**, A.M., President Association of Public School Teachers of Crippled Children in the City of New York. (*Education of Crippled Children*.)
- Frank P. Graves**, Ph.D., LL.D., Professor of History and Philosophy of Education, Ohio State University. (*Epicurus*.)
- Henry S. Graves**, A.M., Director of the Forest School, Yale University; Chief of Forest Service, United States Department of Agriculture. (*Forestry Education*.)
- Isaac T. Headland**, D.D., Professor in the Imperial University, Peking, China. (*Confucius*.)
- William Heaford**, Journalist, London. (*Francisco Ferrer*.)
- Ernest N. Henderson**, Ph.D., Professor of Philosophy and Education, Adelphi College. (*Philosophical and Psychological Topics*.)
- John G. Hibben**, Ph.D., LL.D., Professor of Philosophy, Princeton University. (*Enlightenment*.)
- Herman H. Horne**, Ph.D., Professor of the History of Education, and of the History of Philosophy, New York University. (*Duns Scotus*.)
- Ira W. Howerth**, Ph.D., Assistant Professor of Sociology, University of Chicago. (*Correspondence Schools, etc.*)
- James L. Hughes**, Chief Inspector of Schools, Toronto, Canada. (*Dickens*.)
- George E. Hunt**, M.D., D.D.S., Dean of Indiana Dental College. (*Dental Education*.)
- William DeWitt Hyde**, D.D., LL.D., President of Bowdoin College. (*American College*.)
- Joseph Jastrow**, Ph.D., Professor of Psychology, University of Wisconsin. (*Psychology*.)
- Jeremiah W. Jenks**, Ph.D., LL.D., Professor of Political Economy and Politics, Cornell University. (*Education for Citizenship*.)
- Henry Johnson**, A.M., Professor of History, Teachers College, Columbia University. (*College Entrance Examinations*.)
- Joseph F. Johnson**, A.B., D.C.S., Dean of School of Commerce, New York University. (*Commercial Education*.)
- William Dawson Johnston**, Litt.D., Librarian of Columbia University. (*Congressional Library, etc.*)
- Adam Leroy Jones**, Ph.D., Adjunct Professor of Philosophy, Columbia University. (*American Colleges*.)
- Arthur J. Jones**, Ph.D., Professor of Education, University of Maine. (*Evening Schools*.)
- Daniel Jordan**, B.S., Assistant Professor of Romance Languages and Literature, Columbia University. (*Alliance Française*.)
- Charles H. Judd**, Ph.D., LL.D., Professor and Director of the School of Education, University of Chicago. (*Educational Psychology*.)
- Isaac L. Kandel**, Ph.D., Teaching Fellow in Teachers College, Columbia University. (*Historical and Administrative Topics*.)
- George C. Keidel**, Ph.D., Associate in Romance Languages, Johns Hopkins University. (*Fables*.)
- D. J. Kennedy**, Rev., O.P., Professor of Sacramental Theology, Catholic University, Washington, D.C. (*Dominicans*.)
- Frederick P. Keppel**, A.B., Dean of Columbia College. (*Columbia University, etc.*)
- William H. Kilpatrick**, Ph.D., Assistant Professor in Education, Teachers College, Columbia University. (*Topics in American Educational History*.)
- Helen Kinne**, Professor of Domestic Science, Teachers College, Columbia University. (*Domestic Science, etc.*)
- Edwin A. Kirkpatrick**, Ph.M., Head of Department of Psychology and Child Study, State Normal School, Fitchburg, Mass. (*Psychology*.)
- George P. Krapp**, Ph.D., Professor of English, Columbia University. (*English Usage; Folklore*.)
- Cecil F. Lavell**, Ph.D., Lecturer in Education, Teachers College, Columbia University. (*French Influence on American Education*.)
- Arthur F. Leach**, Charity Commissioner for England and Wales, London. (*Topics in English Educational History*.)
- Daniel D. Luckenbill**, LL.D., Sometime instructor in Semitic Language and Literature, University of Chicago. (*Education in Ancient Egypt*.)
- Gonzalez Lodge**, Ph.D., LL.D., Professor of Latin and Greek, Teachers College, Columbia University. (*Cicero*.)

## CONTRIBUTORS TO VOLUME II

- Donald Macmillan**, Rev., M.A., Kelvinside, Glasgow, Scotland. (*Forbes*, etc.)
- Annie Sullivan Macy**, Teacher of Helen Keller. (*Education of the Deaf-Blind*.)
- Frank A. Manny**, A.M., Assistant Superintendent of City Schools, Baltimore, Md. (*Special Type of Schools*.)
- Guido H. Marx**, M.E., Professor of Mechanical Engineering, Leland Stanford Jr. University. (*Attendance of College Students*.)
- George L. Meylan**, M.D., Adjunct Professor of Physical Education and Medical Director of the Gymnasium, Columbia University. (*Educational Athletics*, etc.)
- Paul Monroe**, Ph.D., Professor of the History of Education, Teachers College, Columbia University. (*History of Education*.)
- Will S. Monroe**, A.B., Professor of Psychology and Education, State Normal School, Montclair, N.J. (*American Biography*, etc.)
- Frederick Montesper**, Ph.D., Head of German Department, DeWitt Clinton High School, New York City; formerly Lecturer on Education, New York University. (*German Educational Biography*.)
- J. E. G. de Montmorency**, B.A., LL.B., Literary Editor of *The Contemporary Review*; Barrister, London, England. (*English Educational History*.)
- Robert L. Packard**, A.M., Specialist in the U. S. Bureau of Education, Washington, D.C. (*National Systems of Education*.)
- Erastus Palmer**, A.B., Professor and Head of Department of Public Speaking, College of the City of New York. (*Declamation; Debating*.)
- Jean Phillipe**, Ph.D., Associate Director of the Laboratory of Physiological Psychology, Sorbonne, Paris. (*French Educational Topics*.)
- Walter B. Pillsbury**, Ph.D., Professor of Psychology, University of Michigan. (*Psychology*.)
- Wyllys Rede**, Rev., Ph.D., D.D., Fellow Johns Hopkins University. (*Church Fathers*.)
- John F. Reigart**, A.M., Principal Public Schools, New York City. (*School Exhibitions; Family Education*.)
- Charles R. Richards**, B.S., Director, Cooper Union, New York City. (*Topics in Industrial Education*.)
- I. Woodbridge Riley**, Ph.D., Professor of Philosophy, Vassar College. (*Emerson*.)
- James H. Robinson**, Ph.D., LL.D., Professor of History, Columbia University. (*Dante*.)
- Pascal Robinson**, Rev., O.F.M., Lector General of Theology, Franciscan Convent, Washington, D.C. (*Franciscans*.)
- Howard J. Rogers**, Ph.D., Sometime Specialist, State Educational Department, Albany, N.Y. (*Education at Expositions*.)
- Michael E. Sadler**, LL.D., Litt.D., Professor of Education, University of Manchester. (*English Educational Biographies*.)
- Eben C. Sage**, D.D., Assistant Secretary, General Education Board. (*American Colleges*.)
- Walter Sargent**, Professor of Fine and Manual Arts, University of Chicago. (*Design*.)
- Monell Sayre**, LL.B., Investigator, Carnegie Foundation for the Advancement of Teaching. (*American Colleges*.)
- Izora Scott**, Ph.D., Instructor in Latin, Erasmus Hall High School, Brooklyn, N.Y. (*Ciceronianism*.)
- Carl E. Seashore**, Ph.D., Professor of Psychology and Dean of the Graduate College, State University of Iowa. (*Psychology*.)
- Edwin R. A. Seligman**, Ph.D., LL.D., Professor of Political Economy, Columbia University. (*Economics*.)
- Isaac Sharpless**, LL.D., President of Haverford College. (*Educational Work of the Friends*.)
- Thomas E. Shields**, Rev., Ph.D., Professor of Education, Catholic University of America, Washington, D.C. (*Convent Schools*, etc.)
- Anna Tolman Smith**, Specialist in Education, United States Bureau of Education, Washington, D.C. (*National Systems of Education*.)
- David Eugene Smith**, Ph.D., LL.D., Professor of Mathematics, Teachers College, Columbia University. (*Mathematics*.)
- David S. Snedden**, Ph.D., Commissioner of Education, State of Massachusetts. (*Topics in Educational Administration*.)
- George M. Stratton**, Ph.D., Professor of Psychology, University of California. (*Psychology*.)
- James Sullivan**, Ph.D., Principal of Boys' High School, Brooklyn, N.Y. (*Cities; Current Events; Economics*, etc.)
- Henry Suzzallo**, Ph.D., Professor of the Philosophy of Education, Teachers College, Columbia University. (*Educational Methods*.)

## CONTRIBUTORS TO VOLUME II

- Ellen B. Talbot**, Ph.D., Professor of Philosophy, Mount Holyoke College. (*Fichte*.)
- Edwin Stanley Thompson**, Superintendent, Mt. Airy School for the Deaf, Philadelphia, Pa. (*Education of the Deaf*.)

# A CYCLOPEDIA OF EDUCATION

## CHURCH ATTENDANCE OF SCHOLARS.

-- In the Middle Ages it was very usual for the elementary school to be held in the church itself, or in a room over the porch, or even in the belfry. Education and religion were intimately combined. The earliest schoolbooks were in effect prayer books; the A B C and the primer were schoolbooks for children, though adults, and lay people, generally, also used the primer in church. The *Expositio Sequentiarum* and the *Expositio Hymnorum* were also schoolbooks based on the church service. Thus we may say without doubt that the parochial school children in the Middle Ages attended church every day. The same was certainly true of the song schools (*q.v.*) attached to the cathedral and secular houses and monasteries.

**England.** — In the Westminster Song School Rules for the Behavior of School Boys (*Westminster Mss.*, edited by M. R. James) there is a full account of the daily attendance of the boys at church. "On entering the church they must make the sign of the cross, and repeat the Lord's Prayer and the Salutation of the Blessed Virgin with a genuflection before the Crucifix. Then they must rise and go into the choir two and two humbly and piously; they must bow in the middle of the choir modestly towards the altar and then withdraw each one to his stall or seat." Then follow long and detailed directions as to their behavior. Somewhat similar rules dealt with the boys in the grammar schools, which were until the fourteenth century exclusively religious schools. The practice of the cathedral grammar school in respect to church attendance was followed by the schools of the smaller secular houses. After the Reformation most grammar schools of any importance provided for this by their statutes. Mr. Foster Watson gives us a number of instances of such statutes, which made it necessary for grammar school boys to attend church on Sundays, holidays, festivals, and (perhaps) on Wednesday and Friday, at any rate in Lent. It was the usual practice for the children to make notes on the sermons and to be examined thereon. In the licenses issued to schoolmasters they were directed to take the children to church to hear divine service and sermons. Article 79 of the Ecclesiastical Canons of 1603 applied both to grammar and parochial schools. It runs as follows: "As often as any sermon shall be upon holy and festival days within the parish where they teach, schoolmasters shall bring their scholars to the church where such sermon shall be made, and then see them quietly

and soberly behave themselves; and shall examine them at times convenient, after their return, what they have borne away of such sermons." In the case, however, of *Belcham v. Barnardiston* (Peere Williams' Reports, Vol. I, p. 32, n.) it was decided (1699) that a schoolmaster could not be prosecuted in the ecclesiastical courts for not bringing his scholars to church in accordance with this canon. The Act of Uniformity of 1662 made it in effect necessary for all schoolmasters to take their children to church, and Archbishop Sheldon in his orders to the bishops of his province asked (4) "whether the said schoolmasters, ushers, schoolmistresses, and instructors, or teachers of youth, publicly or privately, do themselves frequent the public prayers of the church, and cause their scholars to do the same." But stern legislation had the effect of destroying, not of fostering, religious education, and as the eighteenth century dragged its slow length along, very many of the smaller grammar schools gradually ceased to have any scholars to attend church. The charity schools of course sent their boys and girls to church on Sundays, and in various districts pews were reserved for these children; the little parish elementary school, of course, also attended church as in duty bound; while the grammar school-boys, when there were any, went to church. The growth of the monitorial schools through the efforts of Lancaster and Bell (*qq.v.*) largely revived the church attendance of schools from the early days of the nineteenth century. The children in the schools of the National Society (*q.v.*) attended church regularly on Sundays and feast days, and the church voluntary schools throughout the century sent their children to church on Sundays and feast days. In Mr. Brougham's Education Bill of 1820 it was provided that children in the church schools should attend church, and the children in the schools of dissenting sects should attend the chapels of the sects. To this day the children in the church voluntary or "non-provided" schools attend church as a rule on Sunday if they are the children of church people, though of course there is no compulsion in the case. The Elementary Education Act, 1870 (sec. 7 and 74), provides that no school bylaw "shall require any child to attend school on any day exclusively set apart for religious observance by the religious body to which his parent belongs," and in the case of *Marshall v. Graham* (1907, 2 K.B. 112) it was decided that Ascension Day is such a day. On these days it is the practice for the

church children to attend church in the case of the voluntary schools. The attendance of scholars at church is thus to-day, for a very large percentage (perhaps 40 per cent) of the elementary scholars of the country the practice, thus preserving an educational continuity of practice that goes back for many centuries. In the case of the great endowed boarding schools the school chapel takes the place of the church, while in the universities of Oxford and Cambridge attendance at the Church of England chapel on so many occasions a week is only excused on conscientious grounds stated in the case of minors by the parent or guardian.

**Germany.**—So long as the schools were directly attached to church institutions there was no question but that pupils must attend all the services. This practice was taken over by the Latin schools which were established by municipalities. Frequently the pupils formed the choir of the local church, so that they were compelled to attend all the services. A further interference with school work was caused by the compulsory attendance of pupils at weddings and funerals. These practices were taken over at the Reformation, and most of the church and school ordinances of the sixteenth century have reference to the attendance of pupils in church. Gradually the ordinances, evidently recognizing the disturbance and interference with class work, limit the number of services which the pupils must attend. The Goldberg School Laws (1546) insisted on attendance on Sunday, Wednesday, and Friday; the Württemberg Ordinance (1559) on Sunday, Friday, and one other day; the Frankfort School Ordinance (1579) on Sunday and Wednesday; the Pomeranian Ordinance (1539) limited the services to a quarter of an hour. A large number of ordinances refer only to attendance on Sundays, as in the Magdeburg School Ordinance (1553), Pomeranian Church Ordinance (1563), Brandenburg School Ordinance (1564), Sturm's Class Letters (1565). In many cases the pupils were examined on the sermon, and this is provided for in the Brandenburg School Ordinance (1564), Pomeranian Church Ordinance (1563), Stralsund School Ordinance (1591). Naturally the teachers attended with their pupils, if for no other reason than to maintain order and decorum. If there were a number, they were distributed among the pupils, switch in hand, to be used, if necessary, during the service. Apparently care had to be taken to prevent the pupils from creeping under the seats, or purposely singing out of tune, or inattention to the sermon. In these secondary schools the practice of attending church in a body gradually died out in the eighteenth century. The attendance of pupils from the elementary schools was also made compulsory by the Ordinances following the Reformation. In fact, the schools existed for the Church. The curriculum was mainly a preparation for the church service, including as it did religious instruction

and singing. This connection in the country schools was particularly significant because the sexton and school teacher were frequently one and the same. In many ordinances provision was made for the examination of pupils in the catechism on Sunday as well as for the teaching of the catechism to those who did not attend school. Just as at an earlier date the pupils of the Latin schools were employed to sing at funerals, so this task later devolved on the pupils of the elementary schools. The practice of compulsory attendance continued much later in connection with the elementary schools than with the Latin. According to the *General-Landschulreglement* of 1763 parents were compelled to send their children to the teacher on Sunday in order that they might be brought to church in an orderly manner and be under supervision. When the schools became state supported institutions, the compulsory attendance of pupils at church gradually disappeared, although the intimate connection between the church and the school served to some extent to maintain the practice. The teacher, however, particularly in the rural districts, was compelled to attend services in his office of church servant. More and more the periods of religious instruction were employed both by teachers and pastor to influence the pupils to attend the church. At present there is a gradual weakening of the church control over the school pupils. Sunday schools are not widely provided as yet in Germany. Considerable attention is, however, paid by the Church to the pupils for a few months before confirmation, and during that period they are permitted to leave school to attend the church at any time during the week.

**America.**—The practice has long since ceased to be common in America, if indeed it can be said that it ever was. The only law regularly passed in New Netherland regarding schools required that the schoolmasters of the two church schools in New Amsterdam "on Wednesday, before the beginning of the sermon, with the children entrusted to their care, shall appear in the church to examine, after the close of the sermon, each of them his own scholars . . . what they, in the course of the week, do remember of the Christian commands and catechism." The New England grammar schools, following the English custom, required, "That all the Latten Schollers and all other of ye Boyes of competent age and capacity give the Mr an accompt of one passage or sentence at least of ye sermons of the foregoing Sabath on ye 2d day morning" (New Haven Hopkins Grammar School, 1684). The latest instance appears in the New York Lancasterian schools. The religious training of the boys had from the first been a matter of concern. The Bible was read daily. Tuesday afternoon came to be given up to catechizing by the several denominations, and all the children were required to meet on Sunday mornings at their respective schools, and proceed thence under the direction of moni-

tors to the places of public worship to which they respectively belonged.

See BIBLE IN THE SCHOOLS; CHURCH SCHOOLS; RELIGIOUS EDUCATION; MORAL EDUCATION, etc.

**CHURCH DIVINITY SCHOOL OF THE PACIFIC, SAN MATEO, CAL.**—Opened in 1903 as a divinity school for candidates for orders. The course offered is one of three years. The Rt. Rev. William Ford Nicholls, D.D., Bishop of California, is the dean of the faculty.

**CHURCH LADS' BRIGADES.**—See BOYS' BRIGADES.

**CHURCH SCHOOLS.**—The Church is the mother of mediæval and so of modern education throughout the Western world. Though in later times she was rather an unjust step-mother than a nursing mother, yet for 950 years, from 600 to 1550, the Church was the sole provider and protector of education. Some have sought to give the church schools a much longer pedigree, and have traced them to the catechists of the early Church and talked of the catechetical schools of Alexandria in the days of Clement of Alexandria as the origin of the schools of Europe. This, however, is a mistake. (See CHRISTIAN EDUCATION IN THE EARLY CHURCH.) The catechist was not a schoolmaster in the ordinary sense, and the catechumens were grown-up persons in process of conversion to Christianity. They were not scholars, any more than are the people who attend missionary services or seek instruction in the tenets, say, of Christian Science or Theosophy to-day. The education of young Christians as of young heathens went on in the Public Schools of grammar and rhetoric, spread abroad in all the provinces of the Empire. St. Ambrose and St. Augustine (*q.v.*) were both of them pupils in these schools in their youth and masters in them in their mature age; as much as Julian the Apostate himself, who went "to the Basilica, where the boys' schools then were." But the Basilica here does not seem to mean the church, but the Law Court. For some reason law courts were then being transmuted into both schools and churches. As late as 515, the works of Ennodius, a native of Gaul who became Bishop of Pavia, include one of his orations made on the occasion of the school at Milan removing into a building by the Forum, which had been the law court or Basilica. A chance phrase of his,

"I now detest the very name of liberal studies," spoken in the vein of Faust, weary of study and longing for a more active life, has been twisted into condemnation of education and of the study of the classics by the Church. But in another school oration he contrasts the pleasing work of the schoolmaster, "drawing water from the Castalian spring itself," with his own dreary work as a preacher, "shut into a corner of the church," and advises Arator, who afterwards turned the Acts of the Apostles into Latin hexameters, to think twice before he gives up the life of a man of the world for that of a scholar. The public schools only disappeared in the sixth century under the barbarian conquests; and the provision of education and teaching of grammar schools was then taken up by the bishops (see BISHOPS' SCHOOLS). As their dioceses and duties grew, the bishops could not long teach schools in person, and soon devolved the duty on schoolmasters appointed by them; and the eighth century saw schools established as a regular part of the cathedral establishments, taught by one of the clerks of the bishop (see CATHEDRAL SCHOOLS), the Schoolmaster, *Scholasticus, Écclâtre, or Magister Scholarum*. But the *Scholasticus* also had other duties, that of being the lawyer and secretary of the chapter, or chancellor (*q.v.*), and he in turn devolved his teaching duties on the grammar schoolmaster. He retained, however, the theological teaching as the work of the Chancellor's School (*q.v.*), and the superintendence of grammar schools throughout the area of the jurisdiction of the cathedral chapter. This area, originally coterminous with the diocese, became circumscribed by the growth of other churches of canons, and when we arrive at the era of records, we find the chancellors, whether called by that name or not, of these churches (see COLLEGIATE CHURCH SCHOOLS) enjoying the same right of teaching or supervising schools in their jurisdiction as the chancellor of the cathedral itself in his.

Meanwhile the universities had developed as legal schools in Italy, as theological schools at Paris, as mainly theological, but also legal, schools at Oxford. The origin of Paris University may be traced to the facilities afforded by the existence of the independent collegiate church of St. Genesève to teachers like Abélard (*q.v.*), suspected of free thought, to escape the control of the Chancellor of the cathedral of Notre Dame, and, for the multiplication of teaching masters. That of Oxford, similarly, may be found in the collegiate churches of St. Frideswide and St. George, which afforded freedom from the Chancellor of Lincoln. In the thirteenth century, indeed, we find the jurisdiction of the chancellor of that vast diocese, which extended from Lincoln to Oxford and from Northampton to St. Alban's, restricted to the county of Lincoln only. But though the universities escaped from the control of the chancellor, and then, by

Papal Bulls of exemption, from that of the bishop of the dioceses in which they lay, they did not escape, nor want to escape, from the protection and control of the Church, with all the privileges and immunities from lay control enjoyed by the clerical order. On the contrary, they brought a large contingent of lay folk under the control of the Church. All suits, and even criminal cases, between scholars and laymen, came under the cognizance of the Rector of Paris University, of the Chancellors of Oxford and Cambridge, and of the schoolmasters of Canterbury and Orleans, and the rents of the halls and houses they lived in were settled by joint boards of scholars and townsmen. The servants of scholars, the booksellers, parchment providers, stationers, and other tradesmen, who ministered to the wants of the scholars, were ranked as clerics and subject to the Chancellor's jurisdiction. The grammar schools and song schools of the churches, too, enjoyed an absolute monopoly. No one was allowed to teach a grammar school without a license from the schoolmaster of St. Paul's in the whole city of London, except in the equally privileged areas of the royal chapel or collegiate church of St. Martin's-le-Grand and the archbishop's peculiar of St. Mary-le-Bow. The same rule prevailed, and documents of the thirteenth and fourteenth centuries show it in process of enforcement, at York, Lincoln, Beverley, Worcester, Gloucester, St. Alban's, and Bury St. Edmund's. A similar monopoly in favor of the song school was enforced by the precentor at York, Lincoln, and Bury St. Edmund's. At the beginning of the fifteenth century, an attempt to enforce this monopoly through the lay courts, in the Gloucester School case in 1410 was defeated in the Common Pleas because the Court held that schools were a spiritual matter and not cognizable in the Common Law courts. As the monopoly was successfully enforced by the bishop even in 1500, it is not easy to understand why the attempt was made. A counter effort by a lay court, the Mayor's Court of London, to break down the monopoly in London by issuing a prohibition against the privileged masters suing unauthorized rivals in Court Christian, was defeated by the monopolists asking the King for a Writ of Privy Seal addressed to the Mayor. Long after the Reformation, instances of the enforcement of this monopoly are to be found, at Exeter in 1625 by the bishops in favor of the old Cathedral Grammar School, and at Winchester in 1632 by the Archbishop of Canterbury, on behalf of Winchester College School. But in these two instances, the opponents of monopoly eventually prevailed, at Exeter by getting a charter from the Crown, and at Winchester by getting the archbishop to withdraw his prohibition, in favor, in both cases by a curious coincidence, of a new school in an old St. John's Hospital.

Not only was secondary and higher education provided and controlled by the Church, but ele-

mentary education also. The song schools of the great churches were the original provision for this. The song schoolmaster taught reading and grammar, so far as the Parts of Speech, but no farther, as preliminary to singing. It was a song school which Chaucer's Little Clergeon in the *Prioresse's Tale* attended, when his "felaw" said, "I lerne sing, I can but small grammaire." Outside the great churches elementary education was almost everywhere provided by the Parish Clerk. He was a very different person from his modern successor. He was in orders, fourth from the highest, the priest, to the lowest, doorkeeper (*ostiarus*). Pope Leo IV, in 855, prescribed that every priest should have a clerk, a scholar, to read the epistle or lesson. At a visitation by Hinemar of Rheims a few years later one of the articles was whether the parish priest had "a clerk who can keep a school and read the epistle." The *Decretals* of Gregory IX reproduced Leo's decree, adding that the priest was to direct his parishioners to send their sons to the church to be taught. As a means of paying him for his teaching, the clerk was allowed to charge for carrying round the holy water and the holy bread. Sometimes the part of holy water carrier (*aque bajulus*) was used as an exhibition for a poor scholar, not for the elementary schoolmaster, as in Peckham's *Injunctions* in the thirteenth and William of Wykeham's in 1368. In the fourteenth century we find appointments by the Prior of Durham in the priory's possession, in Yorkshire to a reading school distinct from the song school and the grammar school. In 1305 at Lincoln all the parish clerks of the city were had up before the precentor and warned not to teach singing without the license of the song schoolmasters of the cathedral. In the fifteenth century and onward the reading and song schools seem to have been identified, while arithmetic or computation were considered an appendix of the writing school, in the colleges of Aeaster, *c.* 1460, and Rotherham, *c.* 1480. In places so far apart as Coventry, 1462, and Bristol, 1452 and 1502, the duty of teaching reading is expressed or implied as one of the principal duties of the Parish Clerk. This continued after the Reformation. White Kennet in 1695 lays it down as part of the proper duties of the Parish Clerk "to instruct children in reading and writing and rehearsing the church catechism." The courts of law after the Toleration Act held that elementary schools were exempt from the jurisdiction of the ordinary, and so private schools and dissenting schools were enabled to compete with the church schools. Yet even in 1801 a writer in the *Gentleman's Magazine* complaining of the decadence of parish clerks suggested that they should be taken from a better class "so as to make good parish schoolmasters." It was at this very time that the wide extension of "National" schools re-riveted the control of the Church over elementary education. Until 1870 the great majority and until 1902 more

than half the so-called public elementary schools were strict church schools. And the schoolmaster has still to play the organ in church and teach the choir, as he did in the day schools of the fifteenth century. In spite of the Education Acts, 1870 to 1902, and the fact that now public elementary schools live on grants of money from Parliament, many are still under strict church control. A. F. L.

See CHRISTIAN EDUCATION IN THE EARLY CHURCH; also BISHOPS' SCHOOLS; MONASTIC SCHOOLS; REFORMATION AND EDUCATION, etc.

**CICERO, MARCUS TULLIUS.** — The most human of the Romans, is famous as one of the greatest orators of antiquity and as the greatest master of literary style among the Romans. A friend of Julius Cæsar and of most of the influential Romans of the period, he has left us a collection of more than eight hundred letters, which constitute an invaluable body of material for the study of the manners and politics of his time, as well as for the discussion of the character of the writer. During the latter part of his life, when the political conditions at Rome compelled his retirement from public life for a time, he devoted himself to the composition of treatises on Oratory and on various sides of Philosophy. In these he followed in the main Greek works on the same subjects, but he expounded these in a thoroughly luminous and sympathetic manner, and the addition of his own experience made them delightful as well as important elements in forming the minds of later generations. Even in his lifetime Cicero was recognized as the creator of the Latin literary style, and from that time to the present no Roman author or modern writer of Latin has been uninfluenced by his style. During the revival of learning the humanists regarded him as a perfect stylistic model, and Ciceronianism (*q.v.*), as it came to be called, dominated the whole age. Consequently all students of Latin imitated Cicero from the beginning, and the position he then occupied in the schools has not been seriously impaired up to now. At the outset his letters, his *Offices*, as well as his orations, were read by schoolboys, but as the time devoted to Latin has diminished, a selection from the orations has come to be the chief work studied in schools, although various attempts have been made to read a few of the letters in illustration of the history of the period, or of Cicero's own character.

The only ancient life that has come down to us is that by Plutarch, but there is a considerable amount of material to be obtained from his correspondence and from his other works, while subsequent authors make numerous references to him. The most practical modern life is by Straehan-Davidson (New York, 1894), which deals in a clear, candid, and yet appreciative manner with this many-sided man. Trollope's life (London, 1880) is also worth reading. Mommsen's enthusiastic

admiration for Julius Cæsar was coupled with a corresponding contempt for Cicero, and his prejudiced view had a considerable acceptance for a season. But it has come to be more and more appreciated that those characteristics which aroused Mommsen's scorn constitute the strongest ground for a high estimate of Cicero's nature, and that a man who did what he conceived to be right in the face of full appreciation of the consequences and against the promptings of affection and self-interest is in reality a hero. A very sympathetic treatment is that by Duff in his *Literary History of Rome* (London, 1909), while Ferrero's discussion in his *Greatness and Decline of Rome* should not be neglected.

Cicero must be studied in his environment to be fully understood. For this purpose Boissier's *Cicero and his Friends* (New York, 1898) and Warde Fowler's *Social Life at Rome in the Age of Cicero* (New York, 1909) cannot be too strongly recommended, while the introductions to Tyrrell's *Correspondence of Cicero* (7 vols., London, 1885-1901) contain an immense amount of valuable material for studying his personal, political, and literary relations. Those who are interested in his influence on the literature and learning of subsequent ages will find this admirably treated by Zielinski, *Cicero im Wandel der Jahrhunderte* (2d ed., Leipzig, 1908), while his position in the classicism of the Middle Ages is the subject of Scott's *The Controversies over the Imitation of Cicero as a Model of Style* (New York, 1910). As he was an intimate friend of Cæsar, although his political opponent, all discussions of Cæsar have a great deal to do with Cicero; hence the books referred to in the article on Cæsar should also be cited here.

There have been innumerable editions of Cicero in whole or in part since the *editio princeps* of 1498, but the corpus has been too great for many complete editions in modern times. The editions of Baier and Kayser (Berlin, Weidmann) and by Friederich and Mueller (Leipzig, Teubner) are the most recent, aside from the Oxford text now in course of publication by Wilkins and Clark which marks a great advance in the criticism of the text. The only complete edition of the *Orations* with English notes is that by Long (4 vols., London, 1851-1858), now partly out of print. But there are numerous editions of individual orations. Of his letters, in addition to the edition by Tyrrell above mentioned, the selection of Watson (Oxford, 1891) is important. The latter has been admirably translated by Jeans (2d ed., London, 1887). Of school editions there is no lack.

There have been a myriad of studies of Cicero's language from all points of view. The most important recent books are Lebreton's *Études sur la langue et la grammaire de Cicéron* (Paris, 1907), Zielinski's *Das Clauselgesetz in Ciceros Reden* (Leipzig, 1904), and Laurand's *Études sur le style des discours de Cicéron*

(Paris, 1907). Complete lexica to his speeches and philosophical works have been prepared by Merguet (Jena, 1877-1894). For the legal questions involved in the *Orations*, Greenidge's *Legal Procedure in Cicero's Time* (Oxford, 1901) will be found valuable. A complete bibliography may be found in the books above cited and in Teuffel's *History of Latin Literature* (translation by Warr, London, 1891; new German edition announced). G. L.

**CICERONIANISM.** — A term applied in rhetoric and prose style to the standards established by Cicero and exemplified in his works and in the history of education to the exaggerated humanistic tendency of the sixteenth and seventeenth centuries which made the imitation of Cicero's style the chief aim of school work. Two schools of eloquence flourished at Rome in the time of Cicero, the Atticists and the Asiatics. The genius of the great orator lent itself, however, to neither, but freely and independently fashioned a third whose theory is embodied in the *De Oratore*, the *Orator*, and the *Brutus*, where he sets forth the aim of eloquence to be *docere, delectare, et movere*; the means, *Latine, plane, ornate et apte dicere*. The whole is based on general culture, and may be gained by imitation if care is taken to imitate only the virtues of the model. Controversies grew out of the statement of this theory. Brutus and Calvus criticized Cicero's style as redundant and over-elaborate. Caesar wrote *De Analogia* to refute some of the passages of the *De Oratore* relating to the importance and means of obtaining *Latine*. Gallus Pollio wrote against the style of Cicero, and was answered by Suetonius and Aulus Gellius. One, Largius Licinius, is mentioned by Gellius as having written a book entitled *Ciceromastix*. Quintilian stands out as the first great and ardent advocate of Ciceronianism. All his influence at Rome in court and school was exerted to establish a definite system of technique which recognized Cicero as the model. In his *Institutio Oratoria* he follows very minutely the theory of *De Oratore* and *Brutus*, acknowledging his debt to Cicero at every point. We get in the first books the formulation of rules for orthography and grammar based on Cicero's usage. This is the beginning of that phase of Ciceronianism which was destined to control Latin composition in the schools of modern times. Tacitus and the younger Pliny were pupils of Quintilian, and naturally were supporters of the same ideal. Pliny in his *Letters* says that his ambition is to rival Cicero, whom he places above all. Tacitus shows a studied imitation of the master in the *Dialogus de Oratoribus*, which teems with balanced periods and elaborate figures; but in his maturer style he departs from his earlier training and can no longer be called a Ciceronian.

The Church Fathers were divided in their allegiance. The neo-Latin introduced from Africa won many, yet Cicero had some able

followers. Minucius Felix was so much of a Ciceronian that he wrote an argumentative dialogue persuading to Christianity without the use of a single Christian expression; Lactantius (*q.v.*) won the title of the "Christian Cicero;" St. Ambrose (*q.v.*) introduced into the Church a manual of ethics based on the *De Officiis*; and St. Jerome (*q.v.*) strove to conquer prejudice by declaring that he had found no contradiction between a Ciceronian and a Christian. During the Middle Ages Cicero remained the model for the liberal art of rhetoric as practiced in the schools; for that division of Capella's *Liberal Arts* (*q.v.*) which deals with rhetoric is mainly based on Ciceronian usage. In the early period of the Italian Renaissance Ciceronianism became a prominent phase of the revival of learning. Petrarch reveled in the marvelous harmony of Cicero's periods before he was old enough to understand the sense, and wept because his father threatened to burn his beloved books. When the complete manuscripts of *De Oratore* and the *Institutio Oratoria* were discovered (c. 1417), scholars immediately turned to copying, emending, annotating, and imitating these works. Quintilian was used as the guide in the concrete organization of school curricula, and Cicero became the model for composition. At the University of Padua, Gasparino Barzizza (*q.v.*) lectured on the *De Oratore* and arranged a text for his students entitled *Epistolae ad exercitationem accommodatae* (c. 1410), which was but a guide to Ciceronian usage. We have Guarino's testimony that it was through Barzizza that Cicero was loved and studied in all the schools of Italy. Guarino da Verona (*q.v.*) and Vittorino da Feltre (*q.v.*) went forth from the lectures of Barzizza to establish the court schools at Mantua and Ferrara. In the curriculum at Mantua Cicero was emphasized, though other classic authors were studied. Vittorino lectured on *De Oratore*, and is said to have been excelled in his interpretation only by Barzizza. It is fair to say that this school with its spirit, curriculum, and method inaugurated a conception of Ciceronianism which stood for the study of content as well as form, and which therefore was destined to come into conflict with that of the stricter sect of Ciceronians of the sixteenth century. Though Vittorino was the author of no textbooks, two Latin grammars of wide reputation were published by his pupils, a small one based on Vittorino's teaching, compiled by Leonicens (1452), and the large volume of Perotti (*q.v.*) (1468), which has the distinction of being the first modern Latin grammar. Guarino's school differed in no essential from that at Mantua. Cicero was preeminently accepted as the model for prose composition, being studied first through his *Letters* and later through his rhetorical writings. A detailed description of this school can be found in Battista Guarino's *De ordine docendi et studendi* (1459). Two other educational treatises of

about this date may be cited as promoting the Ciceronian ideal laid down by Barzizza and Vittorino: the *De liberorum educatione* of Æneas Sylvius (*q.v.*) (1450) and the *De studiis et litteris* of Leonardo Bruni (1472).

The development of that phase of Ciceronianism which made Cicero the exclusive model of style had reached such proportions toward the end of the fifteenth century that the rational Ciceronians of the type of Barzizza came to be counted as enemies, and the servile imitators were considered the only true disciples. Out of this difference of interpretation grew those famous controversies of Poggio Bracciolini and Lorenzo Valla (*q.v.*), Gianfrancesco Pico and Pietro Bembo, Angelo Poliziano and Paolo Cortesi, as well as that long line of charges and defenses instituted by the *Ciceronianus* of Erasmus. The first of these controversies originated in a criticism of Poggio's diction, which he boasted to be perfect Ciceronian, made by one of Valla's pupils. Valla had been educated at Mantua under Vittorino, but he preferred Quintilian to Cicero, and established a school at Rome (1154) with the avowed purpose of exalting Quintilian over Cicero. Later he wrote his *Elegantiae Latinae Linguae*, in which he pointed out mistakes in Cicero, along with other ancient writers. The quarrel over style was but a minor part of the personal quarrel between the two men, but in the course of his attack upon Valla, Poggio says: "What can be a plainer or more open sign of stupidity than for one to dare to be displeased with Cicero's eloquence and to think that he can improve upon it! No man has ever dared to do this before. Valla, the mad dog, the railing reviler, the wrangling pettifogger, emerging from some hovel, attacks Cicero, whom all acknowledge to be the golden stream of eloquence." The letters of Politian and Cortesi (1493) form really the first serious controversy on the subject. In this Politian maintains that individual originality is possible, though classical models are accepted, that nothing is more dangerous than this newly arisen superstition, and that nothing is more disgusting than those apes of Cicero; Cortesi defends the proposition that Cicero should be the exclusive model of style because it is foolish to imitate any except the best, and that imitation, as understood by Cicero, is necessary in composition. The letters of Pico and Bembo (1512-1513) are similar in content and argument, though very much longer. Bembo was the preëminent leader of the strict Ciceronians, whose canons of style are well exemplified not only in this letter to Pico, but also in his *History of Venice*, where he calls the municipal councillors *patres conscripti*, the nuns *virgines vestales*, the saints *divi*, and the cardinals *senatores*, in order to imitate Cicero. Sadoleto (*q.v.*), whose name is always linked with that of Bembo when Ciceronians are mentioned, did not follow Cicero so slavishly, and in his *De Liberis recte instituendis* he does not set up Cicero as the only model.

Politian and Pico both preached and practiced their doctrine in Florence, but with only moderate success, for the scholars of Italy were fast yielding to the stricter interpretation of imitation. The University of Padua, which had been the home of Barzizza and that early humanism which sought the spirit of Cicero and not the form merely, had now become the center of the stricter sect. Bembo had settled there. Villanovanus (1527) and Longolius (1522) were professors of rhetoric in the University, and among the students were Reginald Pole, Latimer, and Dolet.

Ciceronianism became a matter of general interest in France and Germany upon the publication of the *Ciceronianus* of Erasmus (*q.v.*) (1528). Before that time Erasmus had criticized the Italian Ciceronians and had been criticized by them, but Europe had given little heed. Erasmus was of the early Italian Renaissance school. He believed in the imitation of Ciceronian form and diction, but he would not subordinate subject matter to form, nor would he use pagan vocabulary in treating Christian themes. When in his *Ciceronianus* he had ridiculed the servile imitators, picking them out and reviewing their faults, he found himself, as he expresses it, "an ass among hornets." J. C. Scaliger (1531) and Étienne Dolet (1535) answered Erasmus, setting forth reasons why Cicero should be the exclusive model, yet denying that the Ciceronians refused to read or to use the vocabulary of any other classical author. Franciscus Floridus Sabinus (1539), M. Antonius Muretus (1556), Petrus Ramus (1556) (*q.v.*), and Henrius Stephanus (1578) continued the ridicule begun by Erasmus.

The zeal of the Ciceronians to use the vocabulary of Cicero resulted in the publication of lexicons, phrase books, commentaries, and rhetorics. Among the most important of these are the *Observations* of Nizzoli, the *Commentaries* of Dolet, and the *Thesaurus* of Robert Estienne, which were used universally as the standard Latin dictionaries for more than a century. Nizzoli's *Observations* was first published in Brescia in 1535. It was afterward edited and enlarged by Basilius Zanchus and Cælius Secundus Curio (Basel, 1548); by Marcus Squarcialupus (Basel, 1576) and Christophor Cellarius (Basel, 1583) under the title of *Thesaurus Ciceronianus*; by Alex. Scot (Basel, 1588) with the title of *Apparatus Latinae Locutionis*; by Barezzi (Venice, 1606) and Giacomo Faceciolotti (Padua, 1734) under the title of *Lexicon Ciceronianus*. There were also abridged editions by Antonius Schorus (Colonia, 1578) with a preface by John Sturm (Argentorati, 1580), and one by Aldus Manutius (Francof., 1590). The *Thesaurus* of Estienne, first published in a three folio volume edition in 1536, went through various modifications, but was not exclusively Ciceronian. The *Commentaries* of Dolet (Lyons, 1536-1538) was never so usable because it was not alpha-

betically arranged. An abridged form appeared in 1585 with a preface by Sturm, which was printed in 1606 as an appendix to the Nizzoli lexicon without credit, and in 1734 with credit.

At the close of the sixteenth century general interest in Ciceronian imitation had more or less died out because of the increase of interest in the use of the vernaculars; yet until well up into the eighteenth century articles on the subject in no small number can be found. Certain it is that all through the seventeenth century Latin formed almost the entire subject matter of the curricula of the grammar schools and that Cicero was considered the final authority in usage and form. This is exemplified by such representative schools as St. Paul's in London, the Collège de Guyenne in France, and the Gymnasium of Strasburg, which, established in the first half of the sixteenth century under the impulse of the Renaissance, held with more or less vigor to their ideal until the scientific and realistic movements in education forced modifications.

**CINCINNATI, CITY OF.**—The second largest city in the state of Ohio, and the leading commercial city of the southern part of the state. Incorporated as a city in 1819. In 1900 the total population was 325,902, and its estimated population in 1909 was 351,212. Its school census, 6-21 years of age, was 89,343 in 1909; and its total school enrollment in day schools was 42,092, and 4418 in night schools. The enrollment in private and parochial schools was 19,183 additional. Of the total population in 1900, 18 per cent were foreign born, and 4.4 per cent were negroes. Of the foreign born, 67 per cent were German and 16 per cent Irish.

**History.**—Private-venture schools existed in Cincinnati before 1800, and in 1817 a Lancasterian school of similar type was opened. In 1818 John Kidd, a wealthy baker, bequeathed \$1000 per annum for "the education of poor children and youths of Cincinnati," but in 1825 the fund was taken from the city by his heirs. Another bequest for the same purpose was made in 1824 by Thomas Hughes.

In 1825 the state enacted a new common school law, which, among other things, provided for "a Board of Trustees and Visitors for the Common Schools" of Cincinnati. This Board, consisting of five men, in conjunction with the City Council, was to levy and collect taxes for and to maintain common schools. The first public school was opened in 1828, with between 70 and 80 pupils. The schools at first met with great local opposition, both from the people and the Council. To awaken public interest, public examinations were instituted and street parades were employed. These were kept up for some years, culminating with the great street parade of June, 1833. The result was that the people were won over to the support of the schools, and bonds were issued in 1834-1835 to build eight new schoolhouses. The first printed school report, issued in 1833, showed an expenditure of \$7778 in the preceding year, \$175 of which was for premium books for pupils and for banners for the school parades. Each trustee, at that time, selected such textbooks and made such a course of study as he saw fit for his ward, without reference to the others.

In 1837 the Board was enlarged to two from each of the five wards, instead of one, and new school districts were organized. In 1839 schools were established in orphan asylums; in 1840 the German language was introduced into the common schools; in 1841 a special teacher of penmanship was employed, and even-

ing schools for men were opened; in 1844 the teaching of vocal music was begun; in 1846 the textbooks and the instruction in the schools were made somewhat more uniform; in 1847 a central high school, with a graded course of study, was established; in 1849 schools for colored children were established; a law, in 1850, provided for the election of a City Superintendent of Schools by popular vote; in 1851 the Hughes and the Woodward high schools were established; in 1853 the power to appoint the Superintendent of Schools was given to the Board of Trustees and Visitors; in 1854 intermediate schools, in which the two higher grades of the district schools were collected at a central or intermediate school, were organized; in 1855 evening schools for girls were provided, and the school library of Cincinnati was established; in 1856 an evening high school was established; in 1860 physical instruction became a part of the course of instruction; in 1862 drawing was introduced; in 1868 a city normal school was opened; in 1873 the University of Cincinnati was organized; and in 1875 a school for the deaf was organized, which, in 1888, was adopted as a part of the city school system.

By the addition of wards the Board of Trustees and Visitors slowly increased in numbers from 10 in 1837 to 50 in 1873. In 1878 the term "Board of Education" was substituted for the earlier title; and in 1880 the organization was changed to 12, elected at large, and one from each of the 25 wards. In 1887, the members-at-large were abolished. By 1896, through the addition of wards, the Board numbered 31. In 1904 a general state law with reference to city boards of education was enacted, and under it the Board was reduced to 27, 3 being elected at large and 24 from school districts. In 1908 a new state law permitted of the further reorganization of city boards of education, and the Board now consists of 7 members, all elected at large.

The management of the Board of Education for half a century has been careful and conservative, and the tax rate has been kept low. In 1875, the Board was given control of the levying of taxes for schools, independent of the Council. The Board of Review of the city still had power to cut down the levy. For thirty years after this time no marked progress was made. About 1905 a new interest in education seems to have been awakened in the city, largely due to the campaign made by the Citizens' Municipal Party. New buildings were arranged for; a new high school was established; manual training was introduced into the seventh and eighth grades; kindergartens were added to the system; a school for the blind was opened; and a teachers' college was established in connection with the University of Cincinnati. In 1906 medical inspection was begun; and aid was extended to the Vacation Schools, which had been conducted under

private auspices since 1899. In 1909 a continuation school for apprentices, modeled on the German type, was opened.

**Present System.** — The school system, as at present organized, is as follows: the Board of Education employs as its executive officers a Superintendent of City Schools; a Clerk, who acts as business manager; a Superintendent of Buildings; an Assistant Superintendent, and an Engineer; a Custodian of Supplies; and a Truant Officer with 3 assistants. The Superintendent of Schools is elected for a five-year term, the others for two-year terms. A Board of Examiners of 3, appointed by the Board, examines all teachers for certification and qualification. The Superintendent nominates all teachers to the Board for appointment. He is assisted by a supervisor of physical training, with 5 assistants; a supervisor of penmanship, with 5 assistants; a supervisor of domestic science, with 8 assistants; a supervisor of manual training, with 8 assistants; a supervisor of music, with 9 assistants; a supervisor of drawing, with 8 assistants; a supervisor of German with 186 assistants; and a supervisor of kindergartens. The city system includes kindergartens, conducted in connection with a number of the elementary schools; 47 day elementary schools; 3 day intermediate schools; 3 day high schools; special schools for the deaf and for the blind; a continuation school for apprentices; 4 evening elementary schools; 2 evening high schools; and a city university. For these schools the city employed 65 supervisory officers and 1051 teachers in 1908-1909. Of these teachers, 30 were employed in kindergartens, and 76 in high schools, 84 additional teachers were employed in the evening schools. The total cost for maintenance of the schools, not including the University of Cincinnati, was \$1,549,343. About 11 per cent of this came from state sources, and the remainder from a city tax of 7½ per cent. The University of Cincinnati (*q.v.*), with collegiate, engineering, and graduate departments, a teachers' college, and faculties of law, medicine, and dentistry, is also partially maintained by the city as a city university, forming the culmination of the public school system of the city. E. P. C.

SHOTWELL, JOHN B. *A History of the Schools of Cincinnati*. (Cincinnati, 1902.)

**CINCINNATI, UNIVERSITY OF, CINCINNATI, OHIO.** — Established in 1870 under an act by which the General Assembly of Ohio was empowered to aid and promote education. The academic department was not organized until 1894. An old trust fund was found inadequate, and was supplemented by donations and a public tax. In 1896 the Medical College of Ohio (founded in 1819) became part of the university, joined in 1908 by the Miami

Medical College. In 1896 a Law Department was organized, and in 1897 this was joined by the Cincinnati College Law School. The College of Engineering was organized in 1900. In 1905 the College for Teachers was established in cooperation with the Board of Education of the city. In 1906 a graduate school was organized as a separate department. For admission to the college of liberal arts, schools of law and engineering, candidates must show evidence of preparatory study represented by about 16 units. Certificates from accredited schools are accepted. Candidates who have completed freshman and sophomore years in a recognized college are admitted to the College for Teachers. There were enrolled in 1909-1910 753 students in the college, 223 in the College for Teachers, 203 in engineering, 84 in law, 199 in medicine. There are 86 professors, 5 associate professors, 32 assistant professors, and 100 instructors, demonstrators, and assistants on the faculty. Charles William Dabney, Ph.D., LL.D., is the president.

**CIPHERS.** — See NOTATION.

**CIRCULATING CHARITY SCHOOLS.** —

The term applied to the charity schools of Wales, from the fact that the teacher stopped at each town or village for a few months only at a time, and then passed on to another place. For a discussion of this type of schools, see CHARITY SCHOOLS; WALES, EDUCATION IN; see also MOVING SCHOOLS.

**CIRCULATORY ACTIVITIES.** — The muscular activities involved in distributing the blood through the body are intimately related to all forms of emotion. In general the effect of a pleasurable impression is to heighten the circulatory activity and intensify the activity of the heart, while disagreeable experiences tend to restrict the activity of the circulatory organs. The circulatory processes are among the best means of measuring mental disturbances of an emotional type.

See EMOTIONAL EXPRESSIONS.

**CIRCULAR INSANITY.** — Circular insanity is the name given by some psychiatrists (see article on PSYCHIATRY), to one of the most frequent forms of mental disturbance. It is one of the group of apparently quite different diseases, but undoubtedly of the same cause, course, and outcome. The group to which circular insanity belongs, which includes such apparently diversified forms as simple mania, simple melancholia, and mixtures of these, has been differentiated by Kraepelin, who has given to it the name *manisch-depressive Irresein*, which has been transliterated into English as *Manic-Depressive Insanity*. The symptoms in manic-depressive insanity are grouped in various ways, and to each kind of grouping a separate name is given.

In this kind of insanity the three principal mental symptoms are classed under the following heads: thinking, emotion, will. The abnormalities of a mental order are those of an apparent ease or a difficulty in thinking, those of a marked feeling of well-being or of a state of depression, and those of motor unrest or of a disinclination to move or a slowing of movement. The ways in which these symptoms may be combined, and the variety of the combinations, are shown in the accompanying diagrams. In the figures the dotted line represents the emotional condition or the feeling tone, the broken line the ease in thinking, and the continuous line the character of the acts. Above the horizontal line these mean respectively the feeling of well-being or an exhilaration, apparent ease in thinking, and motor unrest, while below the horizontal line the opposite meaning is given. The horizontal line is taken, as a very artificial standard, as the

Diagram illustrating the possible combination of the three main symptoms in manic-depressive insanity. From Kraepelin (modified).

Thinking ----- Emotion..... Will \_\_\_\_\_

normal level. The vertical lines separate the curve combinations in such a way that the different forms of manic-depressive insanity are represented in this threefold symptomatic way. All the clinical forms of manic-depressive insanity are given diagrammatically in these curves, and the diagrams show well how one form may merge into another. It should be noted that the amount of deviation of the curves from the horizontal line does not indicate the amount or the intensity of the mental condition or the mental change.

In the diagrams the condition *A* represents the main symptoms found in *simple mania*, while *E* is the representation of the condition in *simple depression* or *melancholia*. *B*, *C*, *D*, *F*, *G*, and *H* represent the so-called mixed states; *B* and *C* represent different combinations in *agitated depression*, *D* represents those in *unproductive mania*, and *F* those in *maniacal stupor*. It is found that while any one form

may be recovered from, there is a tendency to recurrence, and that the form in which the disease recurs may be different from the original form. Thus we find individuals in whom one attack of melancholia or mania is followed by a similar attack at an interval of months or years (*recurrent melancholia* and *recurrent mania*), and others in whom there is a regular alternation of maniacal and depressed states, with or without intervening lucid or normal periods between the two forms (*alternating insanity* and *circular insanity*.)

According to Kraepelin from 10 to 15 per cent of all patients admitted to insane hospitals have this kind of insanity, and about two thirds of all cases, and about three quarters of all these cases beginning before the age of 25, are girls and women. About 10 per cent have a first attack before the age of 15, but the greatest number coincides with the adolescent and subsequent growth period, viz., 37 per cent of the admissions (*i.e.* first attacks) occur between the ages of 15 and 20. It will be seen, therefore, that nearly half of the total number of the insane with this form of insanity have the first attack during the period of school life.

In the production of this kind of insanity heredity appears to play a very important rôle, for it has been found that the same or allied forms of mental disease existed in other members of the family in about 80 per cent of all cases. The disease may be initiated by external conditions, mental stress, accidents, bodily disease, etc., but many cases appear to originate spontaneously, and all show a decided disproportion between the reactions (the insanity) and the preceding stress, if that appears to be the cause. A special mental constitution or predisposition is supposed to be present in those who have manic-depressive attacks, and this is shown by the tendency of these patients to get attacks of periodic depressions and excitements which are not sufficiently severe to be called insanity.

The duration of the disease has sometimes been said to be the lifetime, but this can be said only because there is the tendency to recurrence, and because of the mental constitution. Practically all cases have two attacks, the patient being normal, so far as this can be determined, between attacks. The individual attacks greatly vary in duration; some persist only one to two weeks, most are from 6 to 8 months, and a few continue for as long as 2 to 4 years. Real circular insanity, which has been defined above as alternations of maniacal and depressed states without lucid intervals, is incurable and lifelong. The period between attacks of the recoverable forms varies as greatly as the individual lengths of attacks. In early life 1 to 10 years may intervene, while the normal intervening period is usually shorter in later life. On the other hand, it is not unusual to find individuals who after a

first attack in youth remain normal until the ages of 40 or 50. So far as is known at present this kind of insanity is not caused by or associated with characteristic anatomical changes in the nervous system, nor is it caused by microorganisms. It is, therefore, called a functional disease. For the characterization of the different symptoms and of the different forms of the disease the reader is referred to the articles on **MANIA** and **MELANCHOLIA**.

Because of the motor manifestations, especially the condition of retardation in depressions, the disease is sometimes confused with dementia precox (*q.v.*) and with feeble-mindedness (*q.v.*). This is particularly true of the cases which occur during the school period. Since, as was noted above, about one half of such patients have the first attack during the period of school life, a knowledge of the disease is important to the teacher, and any abnormalities of children resembling the symptoms of the forms of the disease should be immediately brought to the attention of the school medical examiner. **CISTERCIANS, EDUCATIONAL ACTIVITY OF.**—The Order of Cistercians was founded at Cîteaux in the diocese of Châlons in 1098 as an offshoot of the Benedictine congregation at Molesmes. The founder was St. Robert, Abbot of Molesmes. One of the first superiors of the new community was the Englishman, Stephen Harding. The entrance of St. Bernard into the order at Cîteaux in 1112 and the foundation of the monastery of Clairvaux in 1115 led to an extraordinary development and activity not only along strictly monastic lines, but also in the outside world of ecclesiastical affairs, especially in the foundation and promotion of various orders of chivalry, in the suppression of heretical teaching, and in the organization of the Second Crusade. Before the death of St. Bernard in 1181 the Cistercian Order had 343 monasteries; by the end of the fourteenth century the number had reached 700. These were distinguished by the extraordinary sanctity and austerity of their inmates, by the zeal with which they undertook and carried out vast projects for the material improvement of the districts in which they were located, and by the hospitality and charity which, according to the tradition of the Benedictine rule, they practiced without stint. The famous chronicler, Caesarius of Heisterbach, himself a Cistercian, tells of a monastery in Westphalia which in a period of more than ordinary

stringency among the neighboring farmers gave up the last of its stores and even pledged the sacred utensils of the sanctuary in order to relieve the poor.

In the fifteenth century the Cistercian Order entered into a period of decay. This led to several attempts at reform, the most successful of which was that inaugurated at La Trappe in the diocese of Séz by the Abbot de Rancé, who entered the order in 1663. The Trappists, as they are commonly called, revived the austerity and fervor of the primitive Cistercian foundation, and amid many difficulties, including several schisms which threatened to disrupt the organization, maintained the reformed rule until the French Revolution. In the wholesale suppression and confiscation which marked the policy of the revolutionists toward the monastic orders, not even Cîteaux and Clairveaux were spared, and the example of France soon spread to Austria, Prussia, Portugal, and Spain. At present the Cistercians of the common observance have 25 monasteries, and the members of the order number 1015, while those of the strict observance have 71 monasteries, with a total membership of more than 4000 monks. Of these 71 monasteries, 3 are in England, 2 in Ireland, 5 in Canada, 1 in Brazil, and 4 in the United States.

**Cistercians in America.**— In 1802 Dom Urbain, a native of Nantes, arrived at Baltimore with 24 other members of the Trappist congregation. They settled first in the neighborhood of Baltimore, but moved three years later to the vicinity of Louisville, Ky. There, having been joined by another contingent from France, they set to work to reclaim a tract of land known as Casey's Creek. In 1809, however, they abandoned the tract and moved to Florissant, La. Thence they moved to Monks' Mound, near St. Louis, in 1810. The next year the settlement was abandoned, and the superior, Dom Urbain, transferred a small portion of his community to the neighborhood of Pittsburg. An equally unsuccessful attempt was made during the same period to found a Trappist colony in Nova Scotia. With greater success the Trappist monastery of Melleray in France undertook in 1848 the reclamation of a tract of land in Kentucky not far from Monks' Mound. The new settlement was called Gethsemane; in 1850 it was erected into an abbey by Pius IX. In 1848, also, the Monastery of Mount Melleray in Ireland sent a number of Trappist monks to Iowa, and there, about 15 miles west of Dubuque, was laid the foundation of the monastery of New Melleray, which was raised to the dignity of an abbey in 1862. Besides these two most important foundations of the Trappist order in the United States, there are two others, the Monastery of Our Lady of the Valley, Lonsdale, R. I. (transferred from Nova Scotia in 1900), and that of Our Lady of Jordan, Ore., founded in 1904 by Dom Marchand, with a party of monks exiled

from France. The five Cistercian monasteries in Canada are: the Abbey of La Trappe, 30 miles from Montreal, founded in 1881, the Monastery of Lake St. John, founded in 1892, the Monastery of Our Lady of the Prairies in Manitoba, founded in 1892, the Monastery of Our Lady of Calvary, Rogersville, N. B., founded in 1902, and the Petit Clairvaux in Nova Scotia, re-founded in 1903. The only Cistercian foundation in South America is that of Maristella near Sao Paulo, Brazil, founded in 1904.

**The Cistercians and Education.**— Owing to the influence of Stephen Harding and St. Bernard, both of whom composed works on asceticism, the Cistercian monasteries from the very beginning were remarkable for the spiritual training which they imparted. Mystic theology was a favorite study in the houses of the order, and not only were the recognized orthodox mystics studied, but also, as is clear from an examination of the twelfth and thirteenth century Mss., such writers as John Scotus Eriugena (*q. v.*), who elsewhere was either completely ignored or mentioned only to be stigmatized as a heretic. There is reason to believe that before the appearance of the Albigensian heresy in the first decades of the thirteenth century, the Cistercians had developed in their own monasteries a system of mystic theology which, while thoroughly orthodox, was far bolder on its speculative side than the traditional mysticism of the school of St. Victor. The appreciation of the importance of the spiritual element in education characterizes the Cistercians throughout the whole course of their history. This is especially true of the Trappists, who have adopted the saying of their founder, De Rancé, "The knowledge of Christ crucified is the only knowledge that a Trappist should possess" — a sentiment which was vigorously combated by Mabillon and other Benedictines.

But while the Cistercians thus exalted into highest prominence the spiritual element in education, they did not, in practice, at least, neglect the material and the intellectual. During the twelfth and thirteenth centuries they set the best kind of practical models of agriculture before the farmers of central Europe; in England they contributed largely to the success of the woolen trade, and throughout Europe generally they improved the conditions of traffic. Not only did they pay particular attention to the training of their own candidates in intellectual as well as in spiritual matters but they also built and maintained in or near their monasteries schools for externs. Of their educational work in Hungary in the nineteenth century Heimbacher says, "The History of the Order in that country is the history of education in Hungary from 1816 to 1896." In England, Ireland, and America the larger Cistercian foundations have schools and colleges and are doing very good work as educators. The

college at Mount Mellera, Ireland, has distinguished itself during the last 15 years, and counts among its pupils many distinguished ecclesiastics throughout the English-speaking world.

Among the first Cistercians were several distinguished theologians, such as Stephen Harding, St. Bernard, William of St. Thierry, and the famous Alanus of Lille (or *ab Insulis*); historians, such as Otto of Freising, Godfrey of Clairvaux, Gunther the Scholastic, Casarius of Heisterbach and Alberic of the Three Fountains; poets, such as Christian von Lilienfeld, and the anonymous monk of Heilsbronn. In the sixteenth and seventeenth centuries the Cistercians continued to contribute to the sacred and profane sciences. The most distinguished of their scholars during those centuries was John Caramuel y Lobkowitz, a man of extraordinary versatility, author of 74 different works on theology, philosophy, mathematics, philology, and natural science. At the present time the order has many scholars of wide reputation, for instance Drs. Neumann, Schneedorfer, Schlögl, and Nagl, who are engaged in university work in Germany and Austria. To the order of the Feuillants, which, like that of the Trappists, is a reform of the original Cistercian institute, belonged the celebrated Cardinal Bona, a seventeenth-century writer on liturgy and ascetical theology. Finally it is worthy of mention that the Trappists who are in charge of the catacombs in Rome have made many interesting discoveries in archæology in recent times. W. T.

**CITIZENSHIP AND EDUCATION.** — The relation of education to citizenship is so manifold that the discussion of this relation is divided into a very great number of topics. The fuller formulation of the theory of education for citizenship is given under the titles, AIM IN EDUCATION; CULTURE; COURSE OF STUDY, THEORY OF; DEMOCRACY AND EDUCATION. For a fuller consideration of the concrete means adopted for developing good citizenship through the schools, see such topics as CIVICS AS A SCHOOL SUBJECT; CURRENT EVENTS, TEACHING OF; ECONOMICS AS A SCHOOL SUBJECT; HISTORY AS A SCHOOL SUBJECT; INDUSTRIAL EDUCATION; MISSIONS, EDUCATIONAL ASPECT OF MODERN; MORAL EDUCATION; RELIGIOUS EDUCATION; together with the article mentioned above,

**COURSE OF STUDY, THEORY OF.** For a discussion of the practical machinery by which various peoples seek to develop good citizenship through the schools, see the article on the systems of education in the various countries. For the consideration of educational attempts to influence abnormal conditions to conform to normal standards of citizenship, see such topics as DEFECTIVES, EDUCATION OF; DEFECTIVES, SCHOOLS FOR; DELINQUENTS; CRIME AND EDUCATION; PENOLOGY; and all related topics. The following discussion is devoted to the outlining of the very general relations of public school work to good citizenship.

Education of children at the expense of the State is justified only on the ground that it materially improves the quality of citizenship. If the State expends its money for this purpose, it should naturally inquire into the best way of accomplishing that purpose; and this way is in part by changes in the curriculum, more by a change in the teacher's attitude toward his work, with the consequent change in his methods.

I. THE CITIZEN EXISTS FOR THE STATE. — In order that the child may become, with increasing years, a more efficient citizen and man who can render more and more aid to the State, he needs to be trained so as to develop to the best advantage all his powers, physical, mental, moral, and religious, and then to devote them to the service of society.

1. **Physical Development.** — (a) *Economic burden of ill health.* — Until late years so little care has been given to the value of good health from the point of view of the public that little literature exists on the subject. In a late report prepared for the National Conservation Commission by Professor Irving Fisher, the economic value of good health, however, is made emphatic. On a conservative basis it is estimated that, owing to our lack of care of health, there are in the United States at least 630,000 deaths annually, which, with due care, would be preventable or at least postponable; and each postponement would, on careful estimate, save on the average \$1700. The national annual unnecessary loss of capitalized net earnings is thus rather more than one billion dollars.

In addition to this Professor Fisher estimates that there are about one million persons in the working period of life who are so ill that they cannot work and yet do not die. Estimating that three fourths of these would work regularly and each normally earn \$700 a year, he finds rather more than \$500,000,000 as the minimum loss of earnings from enforced idleness caused by illness. We may properly add to this the cost of medical attendance, medicine, nursing, etc., with a resulting annual loss of not less than one billion and a half of dollars, making two billions of loss annually from disease. It is a very conservative estimate that 25 per cent of this, \$500,000,000, is preventable. This, added to the loss from preventable deaths, gives a

billion and a half of readily preventable waste in this country, provided due care were paid to health. Aside from the question of the prolongation of life and the direct loss from illness should be added the sum lost from undue fatigues and minor ailments that do not require the care of a physician but which do lessen decidedly the efficiency of work. The same careful observer places this loss at not less than \$500,000,000. The total preventable loss from death and disease and minor ailments would be not less than \$2,000,000,000 annually and is probably two or three times as much. (b) *Remedies.*—With these facts and conservative estimates before us, we see how extremely important it is that our schools teach hygiene for the individual in order that through the increased efficiency coming from good health and the added length of the period of efficiency coming from long life of the individual the State may be benefited.

Beyond this care which the individual may be trained to take of his own health, however, is the great advantage to be secured from the specialized training which leads to effective sanitary measures enforced by the state authorities, an enforcement which can be made much more efficient through the hearty coöperation of the citizens trained to know the need of sanitary measures and willing themselves to submit to any personal discomfort that may be required for their enforcement.

2. **Mental Development.**—(a) *Enjoyment.*—Next in importance to physical health is the development of one's mental equipment and capacities so as to enrich life. The wider the range of sympathy and taste, the more numerous are the opportunities for the gratification of normal healthful desires and the more frequent and deep the satisfaction. The man who walks through the woods and fields with eyes unopened to the beauties of nature about him, by his knowledge of the nature and process of development of plant and animal life loses almost all of the gratification and satisfaction that comes to him who sees not merely with his eyes but with his understanding. To the man unskilled, untrained in music, the works of the greatest musicians fall on ears that hear not. To the person whose literary taste remains uncultivated, the greatest masters of literature often bring no message more important than that given by the ignorant, sensational reporter of the cheap daily press. Many of the greatest satisfactions in life must come from the education that has awakened desires, trained tastes, and thus prepared one's nature for understanding and enjoyment in fields otherwise not accessible.

Part of the training of the schools is not primarily for personal training, but to furnish tools for further investigation and the means of getting a clearer vision of other fields of learning. A knowledge of languages gives one access to the literature and science of other peoples.

Arithmetic and most of the other forms of mathematical learning are keys by which are unlocked the treasure houses of astronomy and physics, and are the tools by which the engineers plan their bridges and factories; while painting and drawing furnish a means of conveying ideas more vividly and accurately than the spoken word.

(b) *Service.*—From the social viewpoint, mental training gives one the ability to be useful in society. The skill in craftsmanship of the carpenter and mason and designer is put at the service of the individuals largely to enable them to gratify their social instincts. Our houses furnish not merely shelter for the individual, but also opportunities for bringing one's self into more intimate and more helpful touch with one's fellows. The training given to the artist, to the orator, to the teacher, and the statesman serves not merely as a means of personal gratification, but, what is of still greater importance, as a means by which these promoters of civilization may so work upon their fellows as often to remold or even recreate society.

3. **Moral and Religious Development.**—(a) *The Sense of Public Duty.*—Perhaps the basis of moral action most generally accepted as a test by thinking men is the good of society. Whatever action tends toward the social welfare is good. Whatever action tends toward the injury or weakening of society is an evil. It becomes, then, the task of the educator to instil into the nature of the young, the spirit of obligation to the State and to society, the idea of social duty. Only when the mass of the citizens stand ready to place their obligations toward the State before all other obligations,—those to self, to family, to friends,—do we find the best State, whatever its form of government. This sense of obligation toward the State is very generally felt in all civilized communities in times of stress and danger. There is little difficulty in time of war in any nation in securing recruits for the service of armies. The citizens almost to a man stand ready on such occasions to assume the hardships and dangers and sacrifices of military life for the good of the State.

The danger to the State from lack of this sense of public duty is felt not in times of war, but in times of peace. Men who would not hesitate to risk their lives for their country will often thoughtlessly fail to realize their duties of voting or of service on juries or other kinds of the routine work of citizenship, and in their carelessness they often selfishly sacrifice the good of the State to their private interests.

(b) *Joy of Service.*—If the training of the youth has been satisfactory, the man not only will feel his duty toward the State, but he will find satisfaction in the opportunity of unselfish service to the State. That only "by toil and tribulation are the ideals of life reached" must not seem too much a hardship. In social as well

as in personal relations the essence of devotion is not merely the willingness to render service, but to sacrifice if need be. Service which does not include some element of sacrifice fails often to accomplish the best for the doer even in enjoyment. It should therefore be the aim of the schools to put into the pupil, as far as possible, not merely the sense of obligation to the State, but also the desire to render glad service to society, even though at the cost of great personal sacrifice.

II. ADAPTATION OF THE CURRICULUM. — If a teacher is himself imbued with the spirit of patriotism and the desire to render service to the community of which he is a member, he will have little difficulty in finding material for turning the minds of his pupils in the same direction in many, and perhaps in all, of the studies in the curriculum. And yet of course some subjects contribute more easily to this result than do others. All can be made to help in bridging over the "gap between school and life"; the school must become a real part of life.

1. **Physical Development.** — (*a*) *Hygiene.* — Pupils should certainly be taught in even the early grades the most important simple facts regarding the care of their bodies: the importance of cleanliness, of food suitable in kind and quantity for their needs, the injuries to which they are liable from wrong habits of clothing, the advantages of proper exercise, and the best methods of securing the good effects of the proper use and of avoiding the abuse of narcotics and stimulants. The essential facts regarding the sexual relations and other information bearing directly upon their physical welfare now often withheld, should be given them simply and directly as far as possible before wrong habits of living have become firmly fixed. Beyond the mere information, however, it is desirable that so far as possible the pupils be themselves directly trained and prepared in many ways. Perhaps especially in the lower grades certain forms of exercises that are in themselves interesting, such as marching, dancing, the playing of games that will serve to train not merely their muscles but also to stimulate the spirit of joyousness in their work and play can be given them. Especial care can also be taken in many cases by means of walks and talks and observations upon nature to put the pupils unconsciously into condition for healthy physical development.

(*b*) *Sanitation.* — Quite early also in the school course can be given the elements of instruction that bear directly upon public service. The need of submission to public regulations regarding quarantine in the case of contagious diseases, the desirability of vaccination not merely for personal protection but for the protection of the community, the need of an adequate and pure water supply, and similar subjects can all be explained in such a way as to impress upon the pupils the unselfish character of the best citizenship, while still further dis-

cussions regarding the need of taxes to be levied upon the individuals for the establishment of water works, for the upbuilding of a school system, for the making of better roads, can all serve to emphasize the solidarity of interests in the community and the need of sacrifice on the part of the individual to promote the public welfare.

2. **Mental Training.** — (*a*) Personal culture in the studies already mentioned that serve primarily to develop in the pupil new tastes and desires that will tend in later life toward enrichment of living will furnish also the opportunities for inculcating lessons of the higher citizenship. If geography is taught as a study of the earth's surface in its relations to society, the right attitude will normally be assumed. The water courses, in their various ramifications from the mountain rivulet to the broad river alive with vessels carrying the commerce of the nation, will be not merely water flowing through the land, but will become nature's agents watering the lands to make them fertile to supply men's needs, and the means by which through commerce men come into close personal touch one with another so as to satisfy not only physical needs, but also to spread the means of culture and enjoyment from one community to another throughout the land. The beauties of Alpine scenery, the magnificence of Niagara, the awe-inspiring spectacle of a tornado or a storm at sea, have significance for us only in their relations to society and their benefit or injury to mankind.

The study of history or civics or literature should be conducted primarily with reference to the lessons that can be drawn regarding the acts and the motives that have led to benefits to others or to the injury of society, in order that by way of example or of warning the pupils may be led to see the usefulness of history or literature or the study of government toward helping them shape their own ambitions and the plans for their lifework. Even music and art and science, approached from this point of view instead of merely from the viewpoint of physical nature, take on new meanings that make for citizenship.

(*b*) This same element of service may likewise be brought out, although perhaps not so simply or directly, in the study of languages, the elements of mathematics, of chemistry, of physics, that in themselves do not serve primarily toward the satisfaction of a personal desire for the awakening of a new taste, but rather as tools for further study or for the acquirement of a skill that will enable one to render better service. When the study of electricity leads to the establishment of the telegraph and of the telephone, or the knowledge of a foreign language enables one to get into personal touch with other races, or the knowledge of mathematics is thought of as the necessary equipment for planning buildings and bridges and railroads to serve human needs, these subjects likewise

assume a meaning for society that at first may not appear.

This is perhaps on the whole the best use of manual training if properly taught. While it serves to give the body exercise and thus to protect the health, while it gives to the hand and eye the training that makes for mental development, it also has a direct aspect of service found in few studies. If a pupil makes a workbox for his mother or a chair for the house or a sled for himself, he sees at once the usefulness of his work for helping others, and that is directly a training for citizenship. Perhaps, too, in no other way can the parents of the pupils who are poor be brought so directly into touch with the schools as through this work. Many children are taken from school to earn money for their parents. If they are learning in the schools skill that seems to have a money-making bearing, whether it be in carpentry or cooking, the parents may well be more ready to leave their children in school for two or three years longer than if their work seems unpractical because non-money-making. The social aspect of manual training is perhaps its chief element of value.

**3. Moral Development.**—In addition to the mental understanding of the social bearings of the studies taken up in the schools, the pupil should acquire as far as possible the spirit which will lead him to be ready to make a sacrifice cheerfully for the good of others. No material change can be made in the subjects of the curriculum that will bring about this result, though some little direct work in moral training might be given. If it is to be reached at all, it will come about primarily through the personality of the teacher and his ability to show the interdependence of human beings one upon the other, the opportunities for service, and the lessons taught by the feelings of the world toward those who have rendered service. This spirit of service may then normally be taken as an ideal toward the attainment of which one may wish to strive.

Moreover, besides this attitude toward one's obligations, there may be given in many instances an opportunity for the practice of citizenship. Habits of courtesy toward teacher and fellow pupils, consideration for the rights and happiness of others, team work, and the administrative subordination that inevitably comes from such work in play or school, attention toward keeping the buildings and school grounds and streets neat and orderly for the public good, even at times the direct practice of some philanthropic service, may well place the pupils far on the way toward the better citizenship. Of course the higher pupils can be given information regarding the form of government, not merely through books, but by visiting meetings of the city councils, noting the work of the nominating conventions or caucuses, seeing how the voter casts his ballot, observing the work of the mayor, the super-

intendent of streets, and other public officials, and by other methods that will serve to show some of the more public duties of the citizen. For older pupils the same lessons can be taught through the form of school government, the school city, or some similar device. But the most essential point is not the form but the spirit—the attitude of the citizen toward life and toward his fellow-men. Practically every study of the curriculum can call the pupils' attention in that direction, but only the personal influence of those whom the pupils recognize as having natures wiser and stronger and better than their own, with the opportunities for acquiring habits of service, can go far toward inculcating this spirit of personal sacrifice for the public good. With this personal influence the teacher may go far toward building up in the students not only the ideals, but also the practice of citizenship. J. W. J.

**CITY SCHOOL ADMINISTRATION** (United States).—**The Problem.**—The word "city," broadly signifying as it does an aggregation of population within a comparatively small area, includes objective situations and social conditions of wide variation. New York City, with its population of 4,500,000, and Chicago with its 2,000,000, obviously have needs and problems vastly unlike the community of

4500 or that of 2000. Yet, according to the modern official standards of classification, the concentration of a few thousands of persons entitles to the designation of *city* as much as tens of thousands, or hundreds of thousands, or thousands of thousands. While differences in numbers alone render difficult either accurate description or definite generalizations of municipal organization and function, differences in physical and industrial environment, and in the moral, intellectual, and sociological character of populations are factors of even greater importance in defining the organized political and social activity of the modern city. Especially important are these factors in qualifying the relations of the city in the performance of its functions as regards education. Due consideration must also be accorded the different legal positions assigned to the city in the several states.

By common usage the term "school administration" has come to comprehend the entire range of operation of the controlling and directive agencies, as well as the form of organization, of public education. Not only is it employed to signify those features of school control which may be properly classified as administrative, but also those which relate to supervision, inspection, and management. Even though the lines of distinction between these several features are not always easily determined, each to a greater or less degree denotes a particular class of activities, the essential and specific characteristics of which are being more generally recognized. With these limitations, "city school administration" will be assumed here to include a generalized description of the means and methods for the organized control of public education under typical urban conditions.

The form, character, and manner of operation of the administration of public education in American municipalities are the composite results of five principal influences: (a) the American social theory of education as a function of the State, (b) the political relationship of the American city to the American state, (c) the democratic ideal of civic and institutional control, (d) the urbanization of population, especially during the last quarter of a century, (e) the extension and development of the function of public education.

In theory, as well as in practice, public education in the United States is considered as a direct function of the individual states. The educational system, however differentiated, and to whatever extent adapted to meet special conditions, is organized with the state as an independent and dominant administrative unit. Local areas of administration (district, township, county, city), to the extent that they are in immediate relation to the public school, are considered as but agents of the state in carrying out the state policy. All special and higher institutions for public edu-

cation are normally held to occupy a similar position. This doctrine has been incorporated to such an extent in the fundamental and statutory law of the different states, and has been enunciated so frequently by the highest courts, as to become one of the fundamental principles of American educational control. Education is a matter of concern to the people of the state as a whole, and is not one primarily for the satisfaction of local needs. Obviously and naturally, this principle has operated as an exceedingly important factor in the development of municipal systems of public schools.

The marked tendency in government for the last three or four decades has been to bring the city more and more within the direct administrative control of the state. The city could not, if it would, live unto itself alone. Every city is a potent influence upon the political, economic, and cultural standards of its environment; and more and more the welfare of the city is reflected in the welfare of the state, as a greater and greater proportion of the population of the state becomes concentrated within urban communities. The original nominal legislative control which the state formerly exercised over the city has been and continues to be transformed into administrative control more or less direct. The state has succeeded in obtaining a double hold upon the city in so far as education is concerned, one through the state organization of the public school system, and one through the subordination of the city in the exercise of its functions as an agency for government.

Nevertheless, the problems of government of the city are radically different from those in nonurban areas. The methods and governmental devices of the latter are not suited to the conditions of the city. Hence the state has been compelled by the force of circumstances to legislate with reference to the peculiar and particular needs of urban populations. The political problem of American educational control has been to develop a high degree of efficiency in the public school system, and at the same time preserve to the people of local communities such a degree of autonomy and freedom for participation as will encourage initiative and fix responsibility. To keep the public educational system of the city democratic and at the same time safeguard it from inefficiency; to preserve it from state bureaucracy, and at the same time protect it from exploitation by party and partisan political influences, represent the constant problems of city school administration. The experiences of American cities have demonstrated beyond a single doubt that only through nonpartisan-ship of control is effective and disinterested school administration possible. The public school is *for* and *of* no class, and therefore citizenship, without reference to political affiliation, economic conditions, cultural standards, religious belief, or sex, should provide not only

ample opportunities for participating in the government of the school, but also responsibilities for such participation.

The problems of municipal government, in a large measure similar under all circumstances, differ widely. The metropolitan city is comparable to the city of a few thousands only in minor particulars. The rapidly expanding and changing urban community contains factors which are not to be found in an older and slower growing community. All in all, it may be said that the majority of the problems of school control pressing for solution at the present time are due in a large degree to the concentration of a diverse population within comparatively small areas and the consequent necessary adaptation to newer economic, physical, moral, and cultural conditions. The rapidity alone with which population has become aggregated in cities (for those of 8000 and over the proportion of the total population rose from 12.5 per cent in 1850 to 16.1 per cent in 1860, to 20.9 per cent in 1870, to 22.6 per cent in 1880, to 29.2 per cent in 1890, to 33.1 per cent in 1900, and to over 40 per cent in 1910) would make necessary a reconstruction of the foundations of municipal social control. Democracy in government receives its first real test in the modern city, and ingenuity for popular government is taxed to the utmost to supply the devices which shall permit the city and efficiency to be developed side by side.

The final determining factor of the municipal school control arises from the large extension and rapid increase in the number of activities of the public school system. Kindergartens, elementary schools, secondary schools of different sorts, playgrounds, night and continuation schools, evening lectures and schools for adults, higher and professional institutions, schools for defectives, dependents, and delinquents are typical of the grades and institutions of education that already belong to the school systems of the larger and more progressive municipalities. Free textbooks and supplies are followed by a proposition for free meals; compulsory attendance laws and child labor prohibitions by demands for school scholarships. Each new educational activity means the assumption of additional municipal responsibility and the presentation of new complications for school administration.

#### General Organization and Administration.

— *Boards.* — The relation and special powers of the city in the performance of its functions pertaining to education are defined by the general provisions of the state law governing the public school system, or by the special provisions of the municipal charter. The chief authority for the direct control of public education is a body of citizens known variously as the board of education, school board, school committee, board of school directors, board of school trustees, board of public education,

board of public schools, board of inspectors, board of school controllers, or board of school commissioners. The term "board of education" is most generally used, although for numerous reasons the term "board of school control" is to be preferred. Depending upon the relations borne to the municipal government, the school systems of American cities may be divided into two general classes, the departmental and the autonomous. To the first class belong those which are considered as departments of the city government; to the second class belong those possessing corporate existence separate and apart from the municipal corporation. In but one city of importance (Buffalo) are the public schools under the immediate and exclusive control of the general governing authority of the city (city council). In this city a special committee of the members of the council acts as a board of education.

Two principal methods obtain for the selection and appointment of boards of education, popular election and appointment. Seventy-five of the 100 chief cities of the country choose members of the board by popular election, either from wards or districts (Detroit, Louisville, Providence, Salt Lake City), or at large (St. Louis, Boston, Cleveland, Minneapolis, Indianapolis, Kansas City, Denver, Seattle). The method of election by the people obtains in nearly all cases of autonomous organization, *i.e.* where the school corporation is largely independent of the municipal corporation. In 16 of the chief cities, the members of the board are appointed, generally by the mayor, with or without confirmation by the council and from the city at large or by wards (New York City, Baltimore, Chicago, San Francisco, New Haven). In Philadelphia the members of the board are appointed by the judge of the court of common pleas, and in Washington by the Commissioners of the District of Columbia. Nine cities have some special method of selection, such as Buffalo, previously mentioned; Charleston (S.C.), 6 of the 10 members elected and 4 appointed by the governor of the state; Savannah (S.C.), 9 of the 12 members self-perpetuating, and 3 chosen by the mayor; Pittsburg, 45 members elected by local boards, existing in each of the districts into which the city is divided; New Orleans, 12 members appointed by city council and 8 by the governor. In a number of cities having the departmental form of organization the mayor or some other representative of the municipal government is a member *ex officio* of the board.

The number of members composing the board varies greatly, from 3 in Troy (N.Y.), Albany (N.Y.), and Fort Wayne (Ind.) to 45 in Pittsburg, 46 in New York, and 90 in Allegheny (Pa.). At the present time 56 boards of the 100 largest cities of the country have 9 or less members, 25 have 10 to 15 members, 15 have 16 to 20 members, and 4 have 30 or more members. There has been a marked tendency in

recent years to reduce the number of members of the board. Typical instances of such reduction are Boston, 24 members to 5; Rochester, 16 to 5; Baltimore, 29 to 9; St. Louis, 21 to 12; Indianapolis, 11 to 5; Milwaukee, 21 to 15; Newark, 32 to 9. The chief argument for the smaller board has been to facilitate action, to increase efficiency, and to center responsibility. The evidence from numerous recent experiences is conclusive that the small board brings into the school administration more effective and higher types of individuals, is more responsive to educational needs, and is less subject to the influence of party or partisan politics.

Boards of education are lay bodies, and, beyond the requirements of being an elector, special qualifications for membership are not usually imposed. In a number of instances, however, charters and general state laws contain provisions as to age, duration of residence, payment of taxes, and the holding no other public office. As a general rule, women are eligible to school board membership in northern and western cities, and may become qualified voters at popular elections for members. The term of office varies from 2 to 7 years, the tendency being for a term of 3 years. No compensation for service is the uniform practice. Conspicuous exceptions to this are San Francisco, where each of the four members receives an annual compensation of \$3000, and Rochester, where members receive \$1200 each as an annual salary. A recent act (1907) of the Ohio legislature authorizes boards of education to set aside a fund of 5 cents per pupil in daily attendance to pay expenses of members. Nominal compensation is provided for in certain classes of cities in Utah, Montana, and Indiana. The temper of the people seems to be opposed to compensation under these circumstances, which are considered as a rare opportunity for individuals to render an unselfish social service.

In so far as experience may be a guide, it may be said that the most effective plan of organization of a municipal board of education includes provisions for a small unpaid board, composed of an odd number (5, 7, or 9 to 15, in metropolitan cities) of representative citizens, possessing qualifications defined by law, elected or appointed from the city at large, without reference to partisan affiliation or influence, for a relatively long term but in such manner as to secure gradual renewal of membership. Provisions for the removal of members for neglect of duty or malfeasance of office are also recognized as desirable.

In addition to the board of education there are, in a number of cities, other boards exercising authority over special activities or institutions. The more important of these special organizations are boards for the examination and certification of teachers, boards of management of teachers' retirement funds, school-house commissions, library boards, and boards in charge of special schools (industrial schools

in particular) and higher institutions (College of the City of New York, University of Cincinnati). Local boards of education representing sections or districts exist in some cities. Excepting a few instances in Pennsylvania, the functions exercised by these local boards are unimportant. In New York City 46 of these local boards exist, one for each of the districts into which the whole city is divided. Each board is composed of 5 persons appointed by the president of the borough, one member of the board of education designated by the president of that board, and a district superintendent of schools. These local boards have a variety of powers, acting chiefly, however, in an advisory capacity to the board of education in matters relating to school accommodations and discipline.

*Powers and Duties.* — The powers and duties of boards of education differ in the widest degree. In some instances the general state laws or special charters prescribe in minute detail the authority of boards; in others the state gives a broad grant of power under which boards are permitted to exercise much initiative and great freedom. Generally speaking, the more important direct authority and responsibility are concerned with financial support, physical accommodations and equipment, examination, certification, appointment, and dismissal of teachers, and the establishment, organization, and classification of schools. The history of American boards of education displays certain tendencies and movements relating to the character of the functions performed. When, in the evolution of local government, the board of education came to be firmly established, practically all of the powers of local school control rested with this board, under such general prescriptions as were indicated by the state. Within these prescriptions, the board, as a unit, legislated and executed through its own officers — president, secretary, auditor, etc. — and performed all the general and specific duties of school control. As the public school system expanded and developed, and as the conditions of school control under urban circumstances became more complicated, the necessity for a division of administrative labor easily arose. This was first met through the organization of the membership of the board into special committees, to each of which was assigned, under the direction of the whole board, the performance of special duties. This committee form of organization represents the first stage in the separation of the legislative and executive functions of the board. As the expansion and development of the school system progressed with the growth of the city, and as the complications resulting from the widening sphere of public education increased, a second stage was gradually reached. The number, importance, and activity of the special committees was diminished, and the professional and execu-

tive activities of the board were little by little delegated to various trained and expert officers, while there was reserved to the board the power of general legislation and advisory control. The unmistakable tendency in municipal school administration has been to increase the number of these professional agents who, while directly responsible to the board of education, are nevertheless granted large independence of action and are protected from personal and partisan interference. The first of such officers to be accorded a place in the administrative scheme was the city superintendent of schools. Next followed the director of business affairs, superintendent of buildings, medical inspector, etc. Each of these officers is a product of the continued differentiation of function of the lay board of education and of the constant division of labor incident to the effective performance of the several expert executive duties.

*The Superintendent of Schools.* — This office, the most important of the professional and expert offices of municipal school administration, was the first to develop. Several cities claim the distinction of having first provided for such an officer. Buffalo (1837), Louisville (1837), St. Louis (1839), Providence (1839), Springfield (Mass.) (1840), New Orleans (1841), Rochester (1843), Columbus (Ohio) (1847), Syracuse (1848), Baltimore (1849), Boston (1851), New York (1852), Jersey City (1853), Brooklyn (1853), Cleveland (1853), and Chicago (1854) belong to the first group of cities in which a superintendent of schools is found. Practically every city to-day has a superintendent of schools. The report of the Commissioner of Education of the United States for 1909 contains a list of 1325 such officers in cities having a population of 4000 or more. He is, with one or two exceptions, elected by the board. In Buffalo and San Francisco he is elected by popular vote. In the larger cities, and in those cities possessing a highly organized school system, the exact status of the superintendent of schools and his relationship to the board of education are clearly defined. In the great majority of cases, however, the city superintendent has an uncertain legal status, and his position is determined altogether by the board to which he is responsible. The term of office ranges from one to six years, the longer term being found only in the larger cities. There is a tendency toward a three-year term. Frequently he holds office for an indefinite period at the pleasure of the board. While practically all of the superintendents of schools are men, there are a few instances, one of them notable (Chicago, 1909), in which this office is held by a woman. The annual compensation varies from an amount, merely nominal, and not much above that of an ordinary teacher in smaller cities, to \$10,000 in Chicago. In 1903 the superintendents of schools in 14 of the 100 largest cities of the country re-

ceived an annual salary of \$5000 or more; in 15, \$4000 to \$5000; in 35, \$3000 to \$4000; in 35, \$2000 to \$3000; and in one \$1000 to \$2000.

Theoretically the superintendent of schools is the educational expert of the board of education. To him is delegated the immediate oversight of, and responsibility for, the conduct of the educational work. He is, as he is very properly designated in some communities, the superintendent of instruction. Under his direction are assistant superintendents, supervisors of special subjects, directors of special activities, principals, and teachers. He should be responsible for the selection, assignment and promotion, and dismissal of teachers, for the definition of the guiding principles of instruction, and for the establishment of educational standards. The evolution of school control for half a century has been to elevate the professional standards of fitness for this officer, and to remove him, in his sphere of legitimate activity, from the influence of those forces that aim to subordinate the school system to personal or political ends. The chief obstacle to reform and efficiency in the administration and supervision of city school systems is the absence of a sufficient number of properly qualified technical experts in education to act as superintendents of schools, the lack of standards of qualification, the insecurity of tenure, and the inadequate compensation for the office, in combination with the lack of independence of action in strictly professional matters.

*General Business Administration.* — Originally the superintendent was the only expert executive officer of the city board of education. As such, his duties covered the entire range of administrative and supervisory control. By and large, this is the position at the present time of the considerable majority of city superintendents. The movement of school control, however, is toward a further differentiation of the executive function so as to separate the business and material administration from the educational administration. This movement has resulted in the establishment in the larger cities of a second expert executive officer, known variously, in accordance with the scope and character of his function, as the school director or business manager.

One of the early and radical measures for this separation of the two principal features of school administration was in operation in Cleveland between 1892 and 1904, and generally known as the Federal or Cleveland Plan (*q.v.*). A school council of seven members, elected at large, was given legislative power over the school budget and school property, and the determination of the general policy of the school system. An officer, known as the School Director, receiving an annual salary of \$5000, was also elected by the people. The school director devoted his entire time to the execu-

utive duties on the financial and physical side of the administration, and possessed the power to veto acts of the board. He also appointed the superintendent of schools, who was responsible to him. The superintendent was given sole power to appoint and discharge all principals and teachers. In 1904 under a general state law the school council became the board of education, the school director the business manager, and he, as well as the superintendent of schools, became responsible to the board of education and was appointed by it. Typical existing illustrations of school organizations providing for expert business administration are found in Indianapolis, where the board of education elects for a term of four years a business director who serves as the executive officer of the board and who exercises administrative control over all expenditures, contracts, buildings, grounds, supplies, and appoints and discharges all employees of the board, such as janitors and engineers. A somewhat similar plan is found in St. Louis, where, in addition to the superintendent of instruction, a commissioner of school buildings, a secretary and treasurer, an auditor, and a supply commissioner are provided for. (See BUSINESS MANAGEMENT.)

*Financial Administration.*—No single item of the budget of local administrative areas approaches in amount that for public education. Usually, from one quarter to one third of the annual total ordinary expenditures for public purposes in American cities is for public schools. In spite of the large amounts expended, both absolute and proportional, the characteristic financial condition is one of inability to meet the ever-increasing demands. No problem in public school administration in cities equals in importance that of providing a sufficient support. Progress and development are more dependent upon this factor than any other. The wise and efficient control and expenditure of public school funds, as well as the means for their increase, are matters not only of vital significance in educational economy, but in general social economy as well.

Some of the more important features of the relation of the State to education in general, and to the school city in particular, are displayed by an analysis of the financial situation as it relates to public education under typical municipal conditions. There are three major sources of ordinary school support: (a) permanent state school funds; (b) general state taxes; (c) local taxes. In but few states is the first of these important as a factor in the municipal finance. The second is a form of compulsory local tax. The revenues derived are usually apportioned on some basis which assumes to equalize the burdens and benefits of education. In operation, this apportionment usually results in benefit to little urban districts. Consequently, the third, the local property tax, becomes the main source of revenue. Here again cities may be divided

into two classes: those in which the boards of education control (within limitations imposed by the state) independently the raising and expenditures of the funds necessary to carry on the educational activities under their charge (St. Louis, Indianapolis, Denver, Cleveland, and Pittsburg); those in which the boards of education are treated as departments of the general municipal government and must submit their estimates for approval and revision to the authority of the municipal government (board of estimate and appointment or council) which ultimately determines the budget (Chicago, San Francisco, Milwaukee, Louisville, Providence). Very frequently, in the cities belonging to the first group, a maximum annual tax, and in some instances a minimum tax, is provided for by the general state law or in the charter. The quite uniform judgment of experts in municipal and educational administration is that boards of education should be authorized to levy a tax rate, within the limits prescribed by law, which should not be subject to review or revision by any other body.

The issuance of bonds for buildings, grounds, and public improvements has, under the stress of the growth of the city, likewise developed into a larger problem of public finance. Usually the maximum amount of such bonds, based on a certain percentage of the taxable property, and the conditions for their issuance, based upon approval by electors or some supervisory body, are accurately prescribed by the law of the state or by the municipal charter. The immediate supervision and management of the financial affairs over which the board of education exercises control is being gradually transferred to the Business Manager or Director, as he is frequently styled.

*Buildings and Equipment.*—The provision of adequate, sanitary, adaptable, economical and artistic public school accommodations constitutes one of the most important aspects of municipal school administration. Financial resources, hygienic requirements, educational needs, and cultural standards center, as it were, in the school equipment and environment. Here a third differentiation of the functions of the board of education is being accomplished. In addition to the superintendent of schools and the general business and financial manager, a third expert—the superintendent of buildings and grounds—is being given a place. The exact status and relationship of this officer have not yet been clearly defined in the general municipal policy. However, whether designated as superintendent of buildings and grounds, supervising architect, or commissioner of school equipment, the general administrative principle of specialization obtains. The former, and still quite usual, practice of actual administration and executive control of buildings, grounds, equipment, and material supplies by clerical employees or committees of the board is being gradually superseded by one that recognizes

the economic and educational necessity of control and direction by experts having an appropriate technical training. Boston, since 1901, affords an interesting illustration of a special schoolhouse department, composed of three commissioners appointed by the mayor. This schoolhouse department exercises a most complete power and authority relative to the selection of lands for school purposes, the making, altering, and approving designs and plans for school purposes, and the erecting, repairing, furnishing, and preparing yards for schools.

*State Relationships.*—In the exercise of its functions as the agent of the state, the city, in the main, acts through its own boards and officers, and under legislative sanctions. Not infrequently the city is to some degree subject to state and county boards of education, state and county superintendents, state and county boards of examiners, textbook commissions, high school inspectors, and factory inspectors. (See articles on ATTENDANCE, COMPULSORY, and CHILD LABOR.) As a general thing, though, any direct authority of the state is delegated, and operates indirectly as regards actual control and administration.

*Professional Administration.*—All of the machinery of organization and the externals of the public school system exist primarily for the purpose of effectively accomplishing specific educational aims. The superintendent of schools and his professional associates—assistant superintendents, principals of elementary, secondary, and special schools, teachers and supervisors of special subjects (music, drawing, nature study, manual arts, etc.), directors of special activities (vacation schools, recreation centers, playgrounds, evening schools, *q.v.*), and classroom teachers—constitute the professional organization. The centralizing tendency in all school administration has resulted in the necessity of such reorganization within the professional force as would increase the importance of the individual unit. School programs, courses of study (*q.v.*), selection of textbooks (*q.v.*) and apparatus, and the determination of standards have come in the well-administered and well-organized municipal school systems to be regarded as matters belonging, not to the lay inept administrative body (board of education), nor to any single bureaucratic head, but to the entire body of the professional administration acting cooperatively. The external authorities and mutual relationships of the individuals comprising this professional administration is no longer a significant item in general school control. The chief problem is to organize and at the same time democratize the teaching force of the schools of the modern city.

Competent professional administration means properly educated and thoroughly trained teachers. As a general rule city school systems are authorized to establish higher standards for the teachers and professional officers than

those operating generally in the school system of the state. Frequently special boards of examiners are created for this purpose in the city. A merit plan of appointment and promotion is being gradually adopted and developed by progressive communities. Permanency of tenure, graduated compensation scales, and retirement funds are serving to bring to the service of the city the best of the talent and to stimulate it to that form of activity that will produce that degree of educational efficiency demanded by the conditions and circumstances of urban life.

*Cooperation in Administration.*—The characteristic tendency of public administration has been toward the centralizing of authority in the hands of a responsible few. The trend of a quarter of a century in public school administration has exhibited this tendency in a marked way. Nevertheless, public education stands somewhat apart from other activities subject to direct social control. Popular interest is for self-evident reasons a vital factor in its welfare and progress. To organize public sentiment in the support of plans for improving public schools of the city and to afford avenues for indirect participation in the work of school control are the aims of numerous clubs, associations, and independent committees of citizens. Woman's clubs, civic improvement societies, public education associations, parents' associations, and commercial clubs are types of extra-legal organizations which are supplementary to boards of education, and which exercise a growing and potent influence in directing and developing the work of public school systems in cities. They may be regarded as a necessary element in the construction of a social institution which is at once democratic and efficient. (See articles on the leading cities.)

**CITY SCHOOL BOARDS.** — See CITY SCHOOL ADMINISTRATION.

**CITY SCHOOLS, BUSINESS OFFICER.** — See BUSINESS MANAGEMENT AND MANAGER.

**CITY SCHOOLS, LOCAL BOARDS.** — Historically, local school boards belong to the earlier stages of the development of a system of city school administration. In the beginning each town or city was either only a country school district, governed by one Board of School Trustees, and new districts were later organized and then united into a loose form of a city system; or in the first establishment of the schools of the town or city the conception was that of a series of New England school districts grouped together, rather than that of a unified town or city school system. The latter was the more common form, and was a somewhat natural conception. Seventy-five years ago the schools in the cities were ungraded district schools, and practically independent in textbooks, methods, and plan. One teacher taught the pupils through most or all of the grades, schools in the same building were parallel rather than related, there were few courses of study in print, the interest in both schools and teachers was narrowly local, and the schools in different parts of a city were district or ward schools rather than a part of a city system.

Under these conditions a series of ward or district schools, with ward or district control, was much more natural than a unified city system with central control. A central board of education, with oversight over all schools, was not at first provided for in a number of cities, but was soon made necessary by the unavoidable interrelations between schools, the development of higher schools, and the necessity of regulating taxation and expenditures. The local ward, or district, boards were elected by the people of the ward or school district; and either an independent central board was established for the city as a whole, as in Chicago, or each local district board was given representation in a central board of education, as in Philadelphia.

Many cities which once had this combined plan of local control and central oversight later abandoned it. Chicago, for example, in 1835 organized its schools under a special law after this plan. A central Board of Inspectors were to be elected by the people, who were to examine teachers, select textbooks, and visit schools. In addition, each city school district was to elect, annually, a district school board of three trustees, who were to employ the teachers for the district, see that a sufficient number of schools were maintained in the district, and to levy all taxes for support of the schools of the district. The system proved inefficient, progress everywhere was impeded by the district system, and in 1857 the district organization was abandoned and a central organization was substituted in its place.

In certain Pennsylvania cities the local board idea has persisted long after its general abandonment elsewhere. In Allegheny, Philadelphia, and Pittsburg good examples of the district system may be found. In Allegheny there are 15 ward boards of 6 members each, elected by wards for three-year terms. The 15 ward boards meet together as a central body of 90, and the ward boards also meet by wards. The ward boards have authority to purchase lots; to erect and repair buildings; to purchase apparatus, books, fuel, and supplies; to pay janitors; to borrow money; and to levy taxes to pay interest and principal on indebtedness. To the central board, known as a Board of Controllers, is given such educational and financial functions as are not entrusted to the ward boards. In Philadelphia and Pittsburg there are 37 district boards of directors, of 13 each in Philadelphia and 6 each in Pittsburg; and also a central school board of 37 members. In Philadelphia the members of this central board are appointed by the judges of the Court of Common Pleas, while in Pittsburg they are elected, one from each ward, with *ex officio* membership in the ward boards. At one time Philadelphia and Pittsburg both had federated central boards, similar to Allegheny, of 500 members in Philadelphia and 234 members in Pittsburg.

The local board system has everywhere proved to be inefficient, and incapable of properly and promptly meeting educational needs. The time consumed in committee work and in transacting the simplest business; the educational and business confusion resulting from such a decentralized system of management; and the local, personal, and political basis of membership on the boards and of the controlling school policy, were such as to lead to the somewhat general abandonment of the plan. It is only as the cities have gotten out from under the incubus of such a system that real educational progress has become possible. The tendency to-day is distinctly away from such a system, and toward an efficient centralized and businesslike system of school administration,

with definite fixing of responsibility and power. (For a more detailed statement as to tendencies and guiding principles, see the articles on CITY SCHOOL ADMINISTRATION.)

Within recent years, due largely to the very rapid growth of cities and the highly centralized system of school administration which has seemed necessary to secure results, a new movement for a restoration of a form of local or district boards has manifested itself. The argument for such boards is that the people may thus visit and inspect the schools in a semi-official capacity; may have a means of meeting and expressing themselves on questions of finance, discipline, sanitary arrangements, and educational policy; and that the people may consequently be led to take a larger and a deeper interest in the schools. The unit proposed is usually a group of city schools, and not the political ward. The city is to be districted by groups of schools; and the board of education or the mayor is to appoint, or the people are to elect, a certain number of resident inspectors, or commissioners. It has usually been proposed to add the district school superintendent to the board, at least in an advisory and explanatory capacity. The proposed Boston charter of 1898 provided for such boards, under the name of Visitors; the Greater New York charter of 1898 provided for the appointment of such inspectors; and the Chicago Educational Commission of 1899 proposed the creation of such resident commissioners for Chicago. In effect the plan is a revival of the New England school visiting committee idea. There is little need for such a system of local educational bodies in any except large cities, and the results obtained under them so far would not indicate that they have been very successful. Fewer proposals are made for their establishment to-day than was the case ten years ago.

For more detailed information see the special articles on the city school systems of ALLEGHENY, CHICAGO, PHILADELPHIA, and PITTSBURG. The plan for local advisory boards was discussed in the *Report* of the Chicago Educational Commission (*q.v.*), pp. 139-143.

CIVICS. — The term "civics" is now generally employed to refer to the teaching of civil government in our elementary and secondary schools and in colleges. The term "civil government," which was formerly very commonly used for describing this study, has been abandoned, because in its interpretation it was usually narrowed down to a study of the mere framework of government. The word "civics"

is said to have been introduced by Henry Randall Waite (see *Standard Dictionary*), and has the advantage over the term "civil government" in that it is now generally understood to include: (1) ethics, or the doctrine of duties in society; (2) civil polity, or governmental methods and machinery; (3) history of civic development and movement.

Like most subjects outside of the three R's in the elementary school curriculum, and the classics and mathematics in the secondary school course of study, the subject matter of civics was not taught in schools until some years after the middle of the nineteenth century. In the year 1859 Daniel Read of Wisconsin read a paper before the National Teachers' Association (after 1870 known as the National Education Association) on *The Importance of Civil Polity as a Branch of Popular Education*. In 1863 a committee of the same association made a special report on the teaching of the principles of government in the schools. In 1869 the following resolutions were passed: "That the National Teachers' Association considers it a part of the duty of all institutions of learning to inculcate the principles of an intelligent citizenship, and to this end they earnestly recommend the more extensive introduction into our public schools of the study of United States History, especially with reference to the principles, the structure and the history of our Political Institutions. That in the opinion of the Association, the introduction of this study into all our schools could be greatly stimulated if colleges should require a fair knowledge of it as a condition of admission, and they respectfully suggest the subject to college authorities for their consideration."

Notwithstanding these resolutions, the study made but slow progress in the schools, though the need of it was urgently felt because of the ever increasing immigration of foreigners to American shores. As most of the colleges gave little or no instruction in political science, they took no steps toward making it an entrance requirement. After 1870 the subject began to find its way gradually into the elementary schools. In 1876 a report which a committee of the National Education Association made on "A Course of Study from the Primary Schools to the University" made no recommendation for the study of civics in the elementary school, and merely recommended a study of the Constitution in the high schools. In 1879 Justice Strong in an address before the Department of Superintendence of the National Education Association urged that after the three R's, which prepared pupils to make their livelihood, the study of the government under which they were living was of next importance. In some schools the formal study of the Constitution of the United States was made before 1880, but in general this study was largely a memorizing of the constitutional clauses, and the texts used were scarcely more than analyses. Little

was done to teach pupils government in its actual working or to teach the duties of citizenship.

Between 1880 and 1890 the study of political science made considerable progress in the colleges, and this movement had much influence on the study of civics in the schools. In many of the high schools, particularly in the West, a brief textbook was introduced in the first year of the high school. Though such texts were brief, they were superior to the brief analyses which had been in use. Papers and addresses on the urgency of teaching civics became more numerous. In 1890 the Committee of Ten was appointed by the National Education Association to report on secondary education. In 1892 President Eliot of Harvard was made chairman, and nine subcommittees were appointed to deal with various secondary school subjects. The eighth of these, known as the Committee on History, Civil Government, and Political Economy, had for its chairman Charles Kendall Adams, President of the University of Wisconsin. The committee carried on some investigations, and discovered that only about one sixth of the elementary schools and one third of the high schools were giving any instruction in civil government. In some of those high schools where the subject was studied it appeared early in the course, and in others it came late. The committee met at Madison, Wis., in December, 1892, and became known as the Madison Conference. It recommended the study of civil government in the eighth grade of the grammar school and in the last year of the high school. The method of instruction in the grammar school was to be by oral lessons with the use of collateral textbooks and in connection with United States history and local geography. In the high school the committee recommended that the textbook should be the basis of instruction, and that it should be accompanied by the study of collateral reading, reports on assigned topics, observations of the workings of the local machinery of government, and comparisons between American and foreign systems of government. The amount of time to be spent was to be one half of that allotted to history in the years mentioned, and the subject was to be studied in close connection with history and as an adjunct to that subject. Nothing was said about its being made a college entrance requirement, as was suggested by the report of 1864.

In 1895 appeared the *Report of the Committee of Fifteen* of the National Education Association on the subject of Elementary Education. This committee recommended in connection with the subject of United States history that there should be given a study of the outlines of the Constitution for 10 to 15 weeks in the last year of the elementary school. In 1897 the Committee on Rural Schools of the same Association made a report recommending a course in United States history and civil gov-

ernment for normal school teachers who were to teach in the rural schools, and made some suggestions about teaching of morals and civics in such schools. In 1899 the Committee of Seven of the American Historical Association—a committee appointed at the instance of a Committee on College Entrance Requirements of the National Education Association—made an elaborate report on history in the schools. They recommended that the fourth year of the high school course be devoted to American history and civics, and that the two subjects be taught in separate courses where it was possible to get the time. Where this was not possible, the committee advised teaching them together.

The high schools generally pursued the latter method in order to save time, with the result that the civics work was mainly in the nature of constitutional history. Very little attention was given to the other elements of civics: the duties of citizenship and government in its actual workings. Because of the failure of the colleges to require a knowledge of civics for entrance, very many schools neglected the subject almost wholly. In 1904 the New England History Teachers' Association published a syllabus upon the lines laid down by the Committee of Seven, and made the same recommendations in regard to civics. This tendency to treat civics as the "poor relation" of United States history and to make its treatment only one of constitutional development met with strong opposition in the Association of History Teachers of the Middle States and Maryland, in the North Central History Teachers' Association, in the New England History Teachers' Association, and in the associations of teachers of various states. Vigorous protests were made against considering the history of an institution the same as the study of an institution in its actual working to-day.

The results of the agitation of the opponents of a combination course resulted in the appointment of a Committee on Civics of the New England History Teachers' Association, and of another by the American Political Science Association. The preliminary sheets of a syllabus were published by the first association in 1908, and the second association published a report in the same year calling for a separate course in civics in the last year of the high school and recommending the making of the subject a college entrance requirement. Throughout the report there is a strong insistence on that view of civics which makes it a study of government in its actual working—national, state, and municipal. The National Municipal League has been actively engaged in promoting the study of municipal civics in the schools, and in its proceedings of 1905 it presented a syllabus for such instruction in both elementary and secondary schools. So far the recommendations have had little effect. The schools of Cleveland, Ohio, have had an admirable syllabus, drawn up for use in this subject, and the High

School of Commerce in New York City has established a course in Municipal Activities.

Notwithstanding the great activity of civic bodies and teachers' associations in all parts of the country, civics as a subject in the schools is still in a very unsatisfactory condition. In spite of the emphatic statements of various committees, it is still taught in the form of constitutional history, and the pupil gets little notion of the way in which the government is actually being carried on at the present time. In the elementary schools of Boston and vicinity no attention is paid to it until the last year, though vague statements are made at times that "civil government shall be taught throughout the course in history." In the last year provision is usually made for the study of the Constitution. In New York City in the elementary schools the syllabus calls for lessons in civics beginning with the fourth grade, and these run through the fifth, sixth, seventh, and eighth grades. In the absence of a detailed syllabus the work is not always as well carried out in some schools as it is in others. The city of Cleveland has prepared the best syllabus for civics in the elementary schools. It begins in a very simple way in the third grade, and is carried through the balance of the eight grades. In the Latin schools of Boston and vicinity the subject is virtually nonexistent. In the high schools it is optional in the third year, and sometimes required, as in Cambridge. When optional it is seldom taken. In New York City and vicinity the course in civics is a part of the course in American history, and is required for graduation.

Between the two extremes represented by these localities there are varying conditions, but in the large majority of the schools where the subject is taught at all it is given as an adjunct of history. As far as statistics can be gathered, it may be stated that approximately one fourth of our secondary schools give no training in civics at all, about one half combine it with American history, and about one fourth give a separate course in it.

At the present time a Committee of Five of the American Historical Association is working on a revision of some of the recommendations of the Committee of Seven, and has made a preliminary report in which a separate course and a separate examination in civics in the fourth year of the high school course is recommended as required. In New York State various committees and civic bodies are at work on the subject, and the same is true in many other states. From such activity it is probable that much more substantial courses in civics will be offered in elementary schools and high schools within the next decade than have ever been offered before.

**Methods of Teaching Civics.**—The earliest advocates of the teaching of civics in the schools had in mind a method of instruction which should give to pupils a knowledge of

the framework of government as it was outlined in the Constitution of the United States. This was the idea of Daniel Read and of the National Teachers' Association. From the resolutions passed by that body in 1869 it is evident that it thought that instruction in civics consisted in teaching "the principles, the structure, and the history of our Political Institutions." Moreover, the study was to be taken up in connection with United States history, and for this purpose the Constitution of the United States was appended to the grammar and high school histories published in the seventies and early eighties. In the bodies of the texts almost nothing was given concerning constitutional government or of the working of the local, state, or national institutions. About two thirds of each text was taken up with the colonial periods, and throughout the emphasis was laid on picturesque narration.

For civic instruction the method consisted in giving the pupils the Constitution to read or to commit to memory. No illuminating material on the actual working of our institutions, national, state, and local, such as could have been found in De Tocqueville, was presented,—a fact no doubt due to the absolute inability of the teachers. This mere "cramping" on the Constitution was felt to be unsatisfactory, and though the study of government was still largely conducted by such a method and felt to be indissolubly connected with the study of United States history, small texts were published in the seventies containing the clauses of the Constitution with comments on them. Such texts were not generally put in the hands of the pupils, but were of aid to the teacher. This method of study of the dry bones of our institutions continued until the middle eighties, when Jesse Macy of the University of Iowa published his small text entitled *Our Government*. This was an attempt by a competent writer to change the prevailing method of instruction in government, and to put interest and life into the mere framework by showing the actual workings. Attention was not confined to the national government, as had been the almost general custom in the past, but considerable time was given to the consideration of local and state governments. In 1888, with the appearance of Bryce's *American Commonwealth*, the revolutionizing of the methods of instruction was made possible. With this monumental work on our government in its actual workings before them, the writers of school texts began gradually to change their methods of treatment. Slowly and almost imperceptibly the texts on civics began to treat of actual government. The committing to memory of the Constitution and the dry commentary on its clauses began to give way to a study of government as actually carried on.

Such a change in method, however, was not by any means general. In most of the schools, high as well as grammar, the average instruc-

tion given was usually nothing more than a mere "cramming" on the Constitution. Texts still continued to be written which were nothing except dry commentaries on the clauses of the Constitution, and the texts determined the methods of instruction. It was only in a few of the most progressive schools that good instruction in civics was given.

Meanwhile a very decided change had taken place in the character of the textbooks on United States history. More and more space was given to the constitutional and institutional aspects, and the idea was thus perpetuated that all necessary instruction in civics could be given through the medium of history—a separate text or course for civics not being considered necessary. This method of instruction in the grammar schools and high schools was favored because it "saved time" and because of the conditions surrounding college entrance examinations for which the high schools largely prepared. Most of the colleges gave either very indifferent instruction in government themselves, or none at all, and had taken no steps toward demanding a knowledge of civics for entrance. This prevailing method of instruction gave to the pupils scarcely anything more than a knowledge of constitutional history. This was to a certain extent encouraged by the *Report of the Committee of Seven* of the American Historical Association, 1899, for though recommending a separate text and course in civics it left it open for the schools to believe that the study could well be carried on without such.

Objections to this method of instruction were frequently heard from teachers and superintendents, but it was not until the Committee on Civics of the New England History Teachers' Association, 1909, and the Committee of Five of the American Political Science Association, 1909, made their reports that the issue was squarely made that instruction in civics in schools should be on the actual working of our government and that the methods to be employed should be such as to give something more than constitutional history, and should be through the medium of a separate course. The *Report of the Committee of Five* of the American Historical Association on the revision of the *Report of the Committee of Seven*, 1910, seems to agree with the reports of the two above committees.

Some schools already have in operation distinct courses in civics, though in the larger number of schools throughout the country the older methods of instruction still prevail. In those schools where the separate course is given there are two ways in which it is conducted: (1) in some the course comes after the course in United States history, and (2) in others it is conducted parallel with it. Those who favor the first method maintain that it is necessary for the pupil to know the history before he is able to understand the government in its actual working at the present time; and those who favor

the second say that by the parallel method much time is saved by avoiding unnecessary repetition and that a better opportunity is offered for taking up current topics because of the longer period during which the course is studied.

In the best high schools of to-day a course in civics is given which has devoted to it 5 hours a week for 20 weeks or 3 hours a week for 40 weeks. A substantial text is placed in the hands of the students, and also a fair number of special works on the federal, state, and local government. Not only is the government of the United States studied, but its institutions are compared with those European governments—the most effective results being derived from comparison. Each student is called upon to present reports both oral and written on topics connected with this comparative study.

In connection with the course a close study of the newspapers and magazines is made for current political happenings, and the students are called upon to give three-minute extemporaneous talks on political events both at home and abroad. The material gathered is put on bulletin boards, pasted in scrapbooks, and used in civic and debating clubs. Government reports, journals, legal forms, and material of an allied nature are consulted in the libraries. Visits are made to the meetings of legislative bodies, courts, and committees. Though the course outlined above is far from being in general use, it is becoming more and more common.

The methods of civics work in the grammar schools throughout the country are very varied. The course in civics is usually carried on in connection with history and geography, and is indifferently handled in most places. The trouble seems to lie in the poor equipment of the average teacher for the work and in the general lack of interest on the part of teachers in the present problems of government. Among grammar schools, as is the case with high schools, there are some marked exceptions and there most excellent methods are in vogue. The study of civics begins in the third or fourth grade in connection with the geography and history of the locality in which the pupil is living. The study usually begins with the roads or streets, the making, the paving, and care of them. Then the water supply is taken up, and gradually the pupil is introduced to more difficult problems, such as, "why are laws made?" and so on, until the whole range of government is covered—local, state, and national. The work is continued throughout all the grades including the eighth or ninth. In some schools the study becomes a distinct course in the eighth or ninth grade, and the opportunity is afforded to give the pupils a thorough knowledge in an elementary way of the actual workings of the government. In the hands of some teachers the course is handled in a fashion similar to that pursued in the best high schools.

The activities of the National Municipal League have been responsible for the introduction in some city schools of special courses in municipal government. Sometimes this course is placed in the last grade of the grammar school or the first year of the high school. The method of teaching is largely inductive. The pupil is called upon to look about him for answers to certain questions given by the teacher and to come to the class prepared to report. The pupil in a way is thus the maker of his own textbook. This simple course of instruction is supplemented in the last year of the high school with older pupils by studying the causes for the failures and successes of municipal government at home and abroad.

In the most modern methods of teaching civics, the idea that the subject should be used to teach patriotism and to drag out moral lessons has been abandoned. The aim has been reduced to the purely practical one of developing good citizens, intelligent as to their duties, knowing wherein the government is good or bad, and able by virtue of their intelligence concerning better conditions prevailing elsewhere to try to improve their own institutions. **CLAFLIN UNIVERSITY, ORANGEBURG, S.C.** — An institution for the education of negroes, founded in 1869 and under the auspices of the South Carolina Conference of the Methodist Episcopal Church. Elementary,

college preparatory, college, normal, and industrial departments are maintained. The college courses are based on about 3 years of high school work, and lead to degrees. The graduates of the normal department are permitted to teach in the public schools without examination. In the industrial department courses in architecture, woodwork, printing, iron work, and many other trades are given. There is a faculty of 8 professors, 1 assistant professor, 24 instructors and assistants.

**CLAP, THOMAS (1703-1767).** — Divine and educator, graduated from Harvard College in 1722, and for 17 years engaged in the ministry. He was called to the presidency of Yale College in 1739, but his congregation being unwilling to part with him, the matter was referred to an ecclesiastical council who advocated his release. The legislature of Connecticut voted to pay the congregation "an indemnity of £53 for the loss of their minister." He was president of Yale for 27 years. Author of *Introduction to the Study of Philosophy* (1743), *Religious Constitution of Colleges* (1754), *History of Yale College* (1766), and of several essays on science and religion. W. S. M.

**CLAREMONT COLLEGE, HICKORY, N. C.** — Founded in 1880 for the higher education of young women. It is under the auspices of the Reformed Church of the United States. Preparatory, collegiate, and fine arts departments are maintained. The college courses which lead to diplomas are based on approximately 4 points of high school work. There is a faculty of 9 instructors.

**CLARK UNIVERSITY, ATLANTA, GA.** — A coeducational institution for the education of negroes, founded in 1870 by the Freedman's Aid Society of the Methodist Episcopal Church. Elementary, academic, collegiate, and normal departments are maintained. Classical and scientific courses based on about twelve points of high school work are given in the college, and lead to degrees. The faculty of the college consists of 6 professors, 1 assistant professor, and 3 instructors.

**CLARK UNIVERSITY, WORCESTER, MASS.** — A nonsectarian institution, originally limited to graduate instruction, opened in 1889, and founded in 1887 by the gift of Jonas Gilmore Clark, an American philanthropist, who began life as a carriage maker and gained a fortune through real estate and business investments. Besides \$2,000,000 with which he endowed the university at its inception, he bequeathed \$200,000 outright and \$1,000,000 and the residue of his estate subject to certain conditions. From the beginning, the policy of the university has been to limit its activities with a view to thoroughness and to scholarly efficiency; there are only the 9 graduate de-

partments of mathematics, physics, chemistry, biology, anthropology, psychology, pedagogy, economics and sociology, and history, and an undergraduate college established in 1902. In accordance with the will of the founder, the undergraduate course has been limited to three years, in the belief that it is possible for the average student to effect important economies in his work. Fraternities have recently been introduced in the college as follows: Kappa Phi, Phi Mu Upsilon, Alpha Sigma Alpha, Loeridion, Phi Delta Sigma, and the Griphon. Intra-collegiate contests replace intercollegiate athletics; partly because the institution is of such recent foundation, the proportion of teachers to students (one to four) is higher than that of any other American university except Johns Hopkins. The absence of social distinctions, and the close contact of student and instructor has caused the college to be characterized as "a hard-working academic democracy." In the place of entrance examinations, the character and school record of each candidate are examined by a faculty committee. In the graduate departments, teachers and students are regarded as fellow laborers, the students giving occasional lectures. A summer school was held during the nine years ending in 1903. In 1899 and 1909 the decennial celebrations were marked by commemorative volumes of reports and addresses. The university is connected with the *American Journal of Psychology*, the *Pedagogical Seminary*, and the *American Journal of Religious Psychology and Education*, all published in Worcester. The university was one of those originally accepted by the Carnegie Foundation for the Advancement of Teaching (*q.v.*). The first Board of Trustees of nine members was selected by the founder; the board is now self-perpetuating.

Grounds, buildings, and equipment were valued (1906) at \$595,500; the total annual receipts were (Treasurer's Report, Sept. 1, 1908) \$297,052.70; balance over expenditures was \$38,093.73. The productive endowment amounts to approximately \$4,000,000. The average salary of a professor is \$3000. There are 37 members on the instructing staff, of whom 8 are full professors. The students number 128, divided as follows: graduate students, 91; undergraduates, 25; Saturday courses, 25. The nature of the university makes numbers a secondary consideration. G. Stanley Hall, Ph.D., LL.D., is president. Carroll D. Wright, first president of Clark College, died Feb. 20, 1909, and has been succeeded by Edmund Clark Sanford, Ph.D.

C. G.

**CLARKE, JOHN.** — Headmaster of the Lincoln Grammar School, c. 1624; called in Lucy Hutchinson's *Life of Colonel Hutchinson* a "superstitious pedant." Clarke published books of merit for use in grammar schools. His *Dux Grammaticus* (1633) gives a comprehen-

sive dialogue of duties at home and abroad of the schoolboy. It is an interesting manual of the teaching of manners and morals. Clarke wrote *Formulae Oratoriae* (4th ed., 1632) which shows exactly, point by point, the building up of an oration, as a school composition for speeches on important occasions, and he includes two *Orations* as delivered in the Lincoln Grammar School in 1624 and 1625, practically the most complete specimens of school orations, of the old type, extant. In 1639 Clarke published *Puroemiologia Anglo-Latina* (*Proverbs English and Latin*). This deserves notice, since Clarke states that he has "gleaned and gathered these Proverbs out of all writers I could read or meet withal and have used herein the help of sundry scholars, and worthy friends, over and besides my own observation of many golden proverbs dropping now and then out of vulgar mouths, *ima de plebe*." To these he supplies appropriate Latin. In his *Phrasologia Puerilis* (1638) Clarke writes the noteworthy sentence, in an age of Latin, "To speak our own Mother-English Tongue purely, properly, elegantly is (for aught I know) as commendable as to speak French, Spanish, Latin, or any other exotic and foreign language." His religious books show that he must have been strongly puritanic, and probably founded his school teaching often on rhetoric drawn from the Scriptures.

F. W.

**CLARKE, JOHN** (1687-1734). — Master of the Grammar School, Hull, and afterwards at the Crypt Grammar School, Gloucester. He graduated from St. John's College, Cambridge, M.A., 1700. He wrote the following school books: 1718, *A Select Century of Cordeus' Colloquies*; 1730, *Select Colloquies of Erasmus*; 1733, *Latin Grammar*, with a dissertation on Language; 1734, *Translation of Sallust* with dissertation upon the usefulness of translations of classical authors; 1740, *Introduction to the Making of Latin*. On education Clarke wrote well-known books: 1720, *An Essay upon the Education of Youth in Grammar Schools, in which the vulgar method of teaching is examined and a new one produced*; 1731, *An Essay on Study, wherein directions are given for the due conduct thereof and the collection of a library*.

F. W.

**CLARKE, JOHN** (1706-1761). — A schoolmaster who was educated at Wakefield and graduated from Trinity College, Cambridge 1726. Schoolmaster of grammar school at Skipton and Beverley. Known as "Little Aristophanes." Dr. Zouch wrote a biography of Clarke, entitled *The Good Schoolmaster*, York, 1798.

**CLARKSBURG COLLEGE, CLARKSBURG, MO.** — Founded in 1876, under the auspices of the Baptists of Central Missouri. It is a coeducational institution maintaining aca-

demie, collegiate, and musical courses. Graduates from approved high schools are admitted without examination. The college courses are based on about twelve points of high school work, and lead to degrees. There is a faculty of six professors.

**CLARKSON MEMORIAL SCHOOL OF TECHNOLOGY, POTSDAM, N.Y.**—Founded in 1895 and chartered Mar. 19, 1896, by the Regents of the University of the State of New York (*q.v.*). The courses, admission to which is by examination or certificate from approved high schools, comprise instruction in language and literature, the applied and economic sciences, engineering, and technology. The first two years are devoted to training in the fundamentals of engineering; the last two, to the branches of chemical, civil, electrical, and mechanical engineering, as the student elects. Courses are also offered leading to certificates in chemical, electrical, and mechanical science, drafting, surveying, and technology, upon completion of two years' college work, planned with a view to positions in the civil service and in various industries. Fraternities have been established as follows: Omicron Pi Omicron and Sigma Delta, both local societies. A liberal estimate of students' expenses is given as \$330; a minimum estimate, as \$298.

The Board of Trustees is a self-perpetuating body of seven members. The institution is one of those originally accepted by the Carnegie Foundation for the Advancement of Teaching (*q.v.*), and participates in its system of retiring allowances to professors. The grounds, buildings, and equipment are valued at about \$162,000; the total annual income was (1908-1909) \$23,749. The average salary of a professor is \$1360. There are (1909) ten members on the instructing staff, six of whom are full professors; the students number 94. William Sleeper Aldrich, M.E., is director.

**CLASS INSTRUCTION.**—See GROUP INSTRUCTION; INDIVIDUAL INSTRUCTION; GRADING AND PROMOTION; UNGRADED CLASS; DEPARTMENTAL TEACHING; TEACHING, METHODS OF.

**CLASSROOMS.**—See ARCHITECTURE, SCHOOL.

**CLASS, SCHOOL.**—See GRADING.

**CLASS TEACHER.**—A teacher having responsible charge of a classroom. In the ordinary organization of the elementary school, the teacher who instructs and manages the pupils of a single classroom. Under the "departmental" system of instruction (where the instructor teaches many classes or grades in one or two subjects only, as in most high schools and in some higher elementary grades)

the class teacher is the one assigned to the responsible management of a particular class, over and above his teaching duties. He is usually responsible for the physical conditions of the classroom, for attendance and other routine matters, for the general morale of the class, and for the supervision of the personal welfare of the pupils under his immediate charge.

See TEACHER; DEPARTMENTAL TEACHING.

**CLASSES.**—See GRADING.

**CLASSICAL LANGUAGES.**—See GREEK; LATIN.

**CLASSIFICATION.**—See GRADING; ORGANIZATION.

**CLASSIFICATION OF EDUCATIONAL PUBLICATIONS.**—See LIBRARY CLASSIFICATION OF EDUCATIONAL PUBLICATIONS.

**CLASSIFICATION OF MENTAL PROCESSES.**—For purposes of scientific study, conscious processes must be distinguished as belonging to different classes. These classes differ from each other in the character of the conditions from which the processes arise, and in the elements of which the processes are composed. The classification which long had vogue in psychological writing emphasized almost exclusively the elements of which states of consciousness were composed. This classification distinguished accordingly between forms of knowledge, forms of feeling, and forms of volition, because these three types of mental activity can easily be distinguished through introspection. In more recent times classifications have laid stress on the conditions of mental processes. Thus sensory and ideational processes differ in that the former are derived from direct stimulations of the senses, while the latter are derived from memory processes which are seated, so far as their physiological conditions are concerned, in the central nervous organs. Still other considerations may enter into the classification. The degree of complexity has often been recognized; thus perception is a complex of sensations, emotion is a complex of feelings.

All these types of classification are valuable for purposes of scientific study, so long as the concrete facts are recognized as more important than any scheme of classification.

C. H. J.

**CLAVIUS, CHRISTOPHER** (CHRISTOPHER KLAU, sometimes thought to have had the German name SCHLUSSEL).—Born at Bamberg, Germany, in 1537, and died at Rome in 1612. He was a Jesuit priest, and taught in a Jesuit college at Rome, called there, it is said, to undertake the reform in the calendar (*q.v.*) instigated by Pope Gregory XIII. He was an

excellent teacher of mathematics, and his textbooks were models of good arrangement. Indeed, his algebra was the first really usable school book on the subject that appeared. His arithmetic appeared in 1585, and went through several editions. His algebra appeared in 1608. His collected works were published in five volumes at Basel in 1612, the year of his death. The teaching of mathematics owes more to Clavius than is generally conceded.

**CLAY MODELING.** — See POTTERY WORK IN THE SCHOOLS.

**CLEANLINESS OF THE SCHOOLROOM.** — In the history of education the word "dust" has become almost a symbol for the school, and everywhere in scholastic literature the dust and odor of the schoolroom are liable to greet us. In spite of modern hygiene, the force of inertia and of tradition has been so strong that even to-day schoolhouses are proverbially stuffy; and observation and investigation alike show the atrociously dirty character of many of them. But lack of cleanliness in schools is to-day unpardonable; for science has given us a gauge of cleanliness, and hygiene has shown the danger of the less obvious forms of dirt, while modern invention has made scientific cleanliness possible. The number of bacteria present in a schoolroom is the scientific standard of cleanliness. Dust furnishes a favorable medium for bacteria, and the number in the air of a schoolroom depends largely on the amount of dust.

Scientific investigation has shown that it is possible to reduce the number of bacteria to a minimum, and on the other hand investigation has shown that by the scientific standard the actual condition of schoolrooms is usually bad. Dr. Caece in Capua found the number of bacteria in the school dust was really colossal, varying in the classrooms from 5 to 25 millions per gram of dust, while in the gymnasium the number was between 17 and 40 millions, and in the kindergarten between 70 and 103 millions. The greatest number was found in June; and at the end of the hours of instruction there were more bacteria than at the beginning. The number in the dust of the kindergarten was explained by the location of the room on the ground floor, with windows opening on a broad and dusty street. The significance of the figures in regard to the number of microorganisms is illustrated by the results of Hesse's investigation. The air on high mountains and on the sea he found almost free from bacteria, but in one cubic meter of the air of a Berlin schoolhouse he found 15,000 microorganisms. According to his estimate each pupil during 5 hours of instruction inhaled 50,000 germs, and the number would be still higher if one of the hours were spent in gymnastic exercises.

Meyrich, a teacher in a Leipzig school, made

a similar investigation by a different method, developing plate cultures after 5 minutes' exposure in schoolrooms during the period of instruction. In one schoolroom tested the number of colonies of bacteria that developed after 72 hours was 158, as compared with only 5 germs which developed under similar conditions from a culture in his own living room.

From such investigations it appears that the number of bacteria in the air of a room is a scientific gauge of its cleanliness, and that the number depends: (1) on the conditions outside the schoolroom, among them the following: the season of the year, the weather, the general surroundings; (2) still more on the conditions inside of the building: conditions that favor the stirring up of the dust, the degree of ventilation, the general cleanliness of the room, the cleanliness of the children, the methods of sweeping, the use of the feather duster, and the like.

Some of the microorganisms are pathogenic, most of them are harmless. But the importance of having the schoolroom clean is shown in the first place by the fact that the dust is liable to do mechanical injury to the tissues of the nose and lungs; as Burgerstein thinks, there are likely to be minute splinters with sharp points and corners which make incisions favorable for inoculation with the tubercle bacillus. Further, the greater the number of the bacteria, the greater the chances that some of them will be of a dangerous character. Not to mention other diseases, the battle against tuberculosis demands cleanliness; and, as in the dust-producing industries, to quote Dr. Albrecht: "The breathing of dust deserves perhaps the greatest consideration of all the injurious conditions of industry," so in the schoolroom the necessary means should be adopted to protect pupils by the very best methods from inhaling any kind of dust.

The sources of pollution of the air of schoolrooms are many, among the chief being dirty children, dirty clothing, chalk dust, coal dust, the miscellaneous dust of out of doors, the air exhaled by the pupils — especially by the 80 per cent of them who are likely to have decaying teeth. And thus the whole problem of cleanliness becomes a complex one. In order to have clean children it is often necessary to have school baths; in order to keep children with purulent discharges from the ear or the like out of school, medical inspection is necessary; in order to reduce the number of decaying teeth, school dentists are needed; but greatly improved conditions can be insured by the adoption of modern methods of ventilation and of cleaning schoolrooms.

The feasibility of such methods has been recently demonstrated; by vacuum cleaning it is possible to have a clean schoolroom every morning. In some buildings used for educational purposes in New York City, in Hartford, Conn., and a number of other cities, vacuum

cleaning plants have been installed. In every schoolhouse equipped with a mechanical system of ventilation or supplied with electricity, vacuum methods can be employed. The cost for the plant is considerable, but the cost for power is practically nothing, and the movable electric cleaners are inexpensive. More time and labor and intelligence on the part of janitors, however, are required with such methods. For every schoolhouse to be erected this method of cleaning should be considered. When vacuum methods cannot be employed, the use of the kerosene oil brush, or of sawdust mixed with oil, or patent preparations of oil and the like, can be used with good effect. Investigations under the direction of the health officer in Milwaukee some years ago indicated that by the abolition of dry sweeping and the continuous use of the kerosene oil brush the number of bacteria was reduced practically to zero. Washing a room or spraying it does not necessarily remove the bacteria; frequent flushing with fresh air by recess ventilation decreases the number; the various oil preparations make the dust stick to the floor; but the continuous use of vacuum methods or the like removes the dust and bids fair to reduce the number near to a minimum in the best buildings.

The demands of cleanliness extend also to all the apparatus and methods of the schoolroom. All textbooks should be sterilized periodically by the use of heated moist air. Individual drinking cups should be washed in boiling water every night or destroyed and replaced by new ones. An alternative is the use of drinking fountains. Clay should be sterilized for use by superheated steam, and in general scientific cleanliness as well as common decency demand clean floors, clean air, clean clothing, clean hands, clean textbooks and school apparatus. Many of the current practices in the school are emphatically condemned by modern hygiene. Four things are an abomination in any school; namely, dry sweeping, a feather duster, a common drinking cup, and a common towel.

The English Children's Act of 1908 gave the Education Authority power to cleanse school children in default of the parents. But it is reported that no satisfactory method for quickly sterilizing and drying clothes has been devised. Formalin fails completely with pediculi. Steam at 100° C. has been experimented with, and in 20 minutes complete sterilization and destruction of vermin was possible. A method of using moist hot air, as in sterilizing books, would perhaps be feasible. School baths have been introduced into many schools in Europe and this country with good results.

The surroundings of the school building also should be clean. There should be no garbage heaps, dumps, ill-smelling industries, or the like permitted in the vicinity. The presence of flies in a schoolroom is an indication of un-

cleanliness of the surroundings. Investigation is likely to show in the neighborhood a stable where horses are kept or a dump or a garbage heap or the like. The house fly never should be permitted in a schoolroom, not only because it carries infectious disease, but also because it is a sure indication of uncleanness in the surroundings.

While the solution of the problem of cleanliness in the schoolroom is difficult, it is of the first importance; and the following are among the essentials involved in it:—

(1) The location of the school building should favor cleanliness. The building itself should be large and spacious, and of simple construction. The so-called hospital construction should be used as much as possible, sharp corners being filled or avoided, no wainscoting or ornamental finish of carved work being used, while the walls and ceilings should be of hard smooth finish, and the floors of the best hardwood. (2) The system of ventilation should be planned with regard to cleanliness; the fresh air should be taken from as favorable a locality as possible, and it should be screened of dust before being introduced into the building. (3) The ordinary means of cleanliness should be utilized. The approaches to the schoolhouse should be of asphalt or similar material, and wire matting should be used at the doors. (4) Measures should be adopted for insuring clean children. The only efficient means seems to be the introduction of school baths. (5) Care should be taken to insure clean clothing of all who enter the school. For this it is necessary that there should be separate rooms for wraps, and special devices may be adopted, as brushes for the shoes and clothes. Most important of all, the coöperation of parents should be secured. Hence the need of school nurses and social workers. (6) For cleanliness in the school atmosphere it is necessary that the teeth of the children should be attended to. From a hygienic point of view the introduction of school dentists seems to be necessary. (7) Habits of personal cleanliness should be instilled into the pupils.

The essential methods for removing the impurities that in spite of all care will be found in schoolrooms are the following:—

(1) The best method for reducing the dust seems to be the use of vacuum cleaners. Dry sweeping, use of a feather duster, common drinking cups, and common towels, should be forbidden. (2) The use of blackboards should be reduced to a minimum; and where blackboards are used, the best quality and the use of dustless erayon are advisable; in case ordinary chalk is used, then removable troughs and the cleaning of the erasers are necessary. (3) There should be no promiscuous use of pencils, penholders, etc. Textbooks should not be exchanged or transferred from one class to another without disinfection. Slates, slate pencils, and sponges should not be used at all.

(4) There should be periodic disinfection of the schoolroom, apparatus, books, and other materials. (5) Individual cups washed daily in boiling water, or else drinking fountains of the improved sort, should be provided. (6) All school property left in the school building by a child sick with a contagious disease should be disinfected or destroyed. W. H. B.

**CLEARNESS.**—When all the elements of an experience are vividly recognized and their relations are also vividly recognized, the experience is said to have the characteristic of clearness.

See ATTENTION; DISTINCTNESS; VIVIDNESS.

**CLEARNESS.**—The first of the four steps of the recitation or inductive development lesson as originally suggested by Herbart. By the step of clearness, Herbart means to indicate the stage where the individual details are grasped clearly as particulars in the whole which is presented. In present terminology, this step is expressed by the terms "analysis" or "preparation" and "presentation."

See APPERCEPTION; RECITATION, METHOD OF.

**CLEAVELAND, NEHEMIAH** (1796-1877).—Educator; graduated from Bowdoin College in 1813, and for forty years engaged in teaching in secondary and collegiate institutions—Dummer and Phillips-Exeter academies and Bowdoin College. He was active in the American Lyceum Association (*q.v.*) and was one of the founders of the American Institute of Instruction (*q.v.*). Author of *History of Bowdoin College*, and of numerous papers on education in proceedings of associations and in journals. W. S. M.

**CLEAVELAND, PARKER** (1780-1858).—Educator; graduated from Harvard in 1799, and for two years served as a tutor in that

institution. For twenty years (1805-1825) he was professor of science in Bowdoin College, and he published the first American textbooks on geology and mineralogy. W. S. M.

**CLEF.**—See MUSICAL NOTATION.

**CLELAND, JAMES.**—An English writer who in 1607 published *Προπαίδειά*, or *The Institution of a Young Nobleman*, at Oxford; but Mr. Madan says, "The author was not an Oxford man, not apparently connected with the place in any way." Cleland does not recommend a nobleman to go to the University, but instead to go to Prince Henry's Court or Academy at Nonsuch. Nevertheless, Cleland's book is of great interest educationally. The subjects treated are: 1. The duty of parents toward their children. 2. The duty of Tutors. 3. The young Nobleman's duty towards God. 4. His duty towards his parents and tutor. 5. His duty in civil conversation. 6. The Nobleman's "way," in traveling. Gentleness is to be shown to children, "for he that would have a rose or a violet to smell sweetly, must not crush them in his hand or burn them in the fire." The tutor is to hide his own disposition, whilst he discovers that of his pupil. Let the boy "lay his eyes about him," develop his judgment, and be modest. Let him be familiar with and inquire from the "meanest tradesman." He may have something from the least "foot-boy that goeth by the way." Ever keep him occupied. Let all the world be his book. Great care is to be taken in learning the catechism and the Bible, in the fashioning of manners. "Above our pupil's school chamber I would have Joy, Lady Flora, and the three Graces painted, that he may see pleasure is joined with profit." Cleland has chapters on the teaching of reading, writing, and grammar; the Humanities; Logic and Philosophy; the Mathematics. Memory is unduly esteemed; judgment and imagination ought to be rather sought. The mother-tongue is praised highly. See, he says, that the nurse and servants speak the vernacular purely. Pay attention to clear and distinct reading, with a sweet accent. Latin should be taught by the simplest grammar-teaching and the colloquies of Vives (*q.v.*) and Corderius (*q.v.*). Sound English speaking precedes Latin speaking. Cleland is an advocate of early study of the French language, the accent of which is best learned in childhood; Greek is best begun with the Greek Testament. The reading of history is, at length, the nobleman's chiefest study. Names and dates are only the "anatomy" of the study; the training of the judgment is the chief concern. Simple logic is necessary for higher studies. Mathematics, including geometry, architecture, descriptive geography, with maps and globes should be studied. Law is a necessary equipment, for even the interpretation of an Act of Parliament or the

statutes of the realm as well as for common law. The nobleman will be a magistrate, or at any rate will constantly be asked for advice in practical affairs requiring legal knowledge. Cleland gives careful advice for general reading of books. On all points of behavior at home, abroad, and at court, the nobleman must be correct and dignified. Physical exercises and traveling complete his equipment. Cleland thus is important, first, in his emphasis on the complete command of the vernacular; secondly, for his idea of an all-round education, which brings the classics into a modified systematic perspective. F. W.

**CLEMENT OF ALEXANDRIA.** (150-215).—The details of the life of Titus Flavius Clemens, known as Clement of Alexandria to distinguish him from his namesake of Rome, are obscure. Hardly a date in his life is more than a conjecture. Yet the personality of the man is very clearly defined by his writings which are among the most important of the Ante-Nicene period of the Church. He appears to have been born about the middle of the second century, but in what country is not known. Before he settled in Alexandria, shortly before 190, he had traveled extensively in Greece, Italy, Palestine, and the Orient, and he had studied under teachers from widely separated provinces before he met his last teacher, Pantenus, the " Sicilian bee," the reputed founder of the Catechetical School of Alexandria (*q.v.*). Clement became his colleague in this school about 190, and here he worked for several years busily engaged in teaching. He succeeded to the headship of the institution soon after 200, but on account of the persecution under Septimius Severus he fled from Alexandria in 202 or 203, never to return. In 211 he appears for a moment in Jerusalem, in which his pupil Alexander was settled as Bishop, for in that year he is the bearer of a letter from the Church at Jerusalem to the Church at Antioch. He then disappears from history, and was certainly dead before 216. Clement was not the first educated Greek to become a Christian. Justin Martyr was in this his predecessor, and gave the line of thought which Clement developed, whereby Greek philosophy and Christian teaching were brought permanently into conjunction. The importance of this for Christianity and Christian education can hardly be overestimated. So long as philosophical thought and metaphysical categories should be applied to Christian doctrine it would be necessary to study Greek philosophy either in the works of the great masters or in those of their epitomizers. When Christian theology had once become, under the influence of the School of Alexandria, a philosophical science, the interest in philosophy never died out, but flourished with the flourishing of religious thought. This interest continued active in the East at least until the times of John of Damascus, the founder of Greek

scholasticism. In the West the philosophical activity of scholasticism is ultimately traceable to the influence of Clement upon theology. In general the position of Clement regarding philosophy was that in the divine economy Greek philosophy held in the case of the Greeks the same place as did the Mosaic law, including the prophets, in the case of the Jews. A knowledge of both was therefore needed as a preparation for the understanding of Christian teaching. The application of this principle Clement was able to sketch out at considerable length in his great work, which without a title as a whole is made up of three parts, entitled respectively, *Exhortation to the Greeks*, the *Instructor*, or *Pedagogue*, and the *Miscellanies* or *Stromata*. A few fragments, doubtful works and a minor piece, have also been preserved, but they add little to our knowledge of the teaching of Clement. In common with much Greek thought, Clement regarded knowledge as the basis of virtue, and advance in knowledge as advance in virtuous living. He therefore delighted in regarding the Christian, in opposition to the various Gnostic heretics, as the true Gnostic, and he thereby, perhaps, gave an over-emphasis to the intellectual side of Christianity. This, however, was a natural consequence of the notion of the Logos, which plays so large a part in his speculation. The Logos was the divine Reason, revealed in part to the Greeks and in part to the Jews, but now revealed completely and personally in Christ. This Logos was the divine Pedagogue, and his training was therefore addressed to the reason or understanding. In the *Pedagogue* Clement develops at length his ideal of Christian training of character, going into all sides of the daily life, and pointing out details which sometimes hardly come up to the dignity of the subject, but giving an admirable picture of his ideal of Christian moral education. In this portion of his work, Clement did not hesitate to borrow largely from the Stoic philosopher Musonius. Clement was a man of uncommonly wide reading, but singularly unsystematic and desultory in style and thinking. Yet he seems to have exerted a powerful influence upon his pupils, especially Origen, and though deficient in the art of systematic exposition to have succeeded as a teacher. J. C. A.

The best edition of the works of Clement is that by Potter, Oxford, 1715, often reprinted and most recently by Migne in his *Patrologia Græca*, Vols. VIII-IX; a new edition appears in the Greek Fathers of the first three centuries issued by the Berlin Academy. The works of Clement have been translated into English, *Ante-Nicene Fathers*, ed. Coxe (Buffalo and New York, 1885), Vol. II.

**CLEMSON AGRICULTURAL COLLEGE, CLEMSON COLLEGE, S.C.**—Opened in 1893, as an institution to give preparatory, agricultural, and engineering courses. Seven four-year courses are offered, leading to the degree of bachelor of science. The entrance requirements for these courses are somewhat higher than those for graduation from a grammar school. The institution also gives courses in cotton grading and textiles. The faculty consists of 38 professors and 6 instructors and assistants.

**CLERGY, BENEFIT OF.**—See **BENEFIT OF CLERGY.**

**CLERGY, EDUCATION OF.**—See **MINISTRY, EDUCATION OF.**

**CLERK.**—Whatever may be the true origin of the term "clerk," whether it is derived from the bishops as the successors of the Apostles, on whom the lot of the ministry fell, as on the election of Matthias (Acts i, 17), or from the early Christians, who had part or lot in the Lord or the Kingdom of Heaven, by the time that we meet it in records of mediæval Europe it had come to mean the whole clergy, every one who was in any one of the seven or eight orders, down to the *ostiarius* or doorkeeper, and later, any one who had taken the first tonsure, that is, had shaved a patch in the middle of his head and been recognized as a cleric. But, concurrently with this meaning, because to the world a more certain sign of clericalism than the tonsure, which might be neglected by the man who had a right to it and assumed by him who had not, was learning, that is, a knowledge of Latin. "Clerk" came to mean a learned person, and, in particular, a scholar, whether learner or teacher. In an age of violence, great were the privileges of being a clerk, and they were continually growing. A clerk was in theory free from fear for his person. Any one, clerk or layman, who assaulted a clerk, was *ipso facto* excommunicate, and absolution for the offense was reserved to the Pope himself. A clerk was not amenable to the fierce justice or injustice of the lay courts, which not only hanged, but mutilated, on the smallest provocation. A clerk, convicted of any crime, must be handed over to his ecclesiastical superior, and though he might be imprisoned by that superior and made to do penance in very unpleasant ways, he would not be deprived of life or limb. This privilege became known as benefit of learning, and in the thirteenth and fourteenth centuries we find the ecclesiastical authorities, bishops or chapters, appointing representatives to attend at the assizes of the royal courts and

claim the surrender of clerks convicted to their mild paternal jurisdiction. In later times the courts themselves seem to have let their convicts go free for the first time on proof of clerkship by reading a verse of the Psalm, which became known as the *Neck-verse*. A clerk could not even be burnt for heresy until he had first been degraded from clerkship.

Great was the attraction of being a clerk, for though theoretically a clerk could not assault others or wear arms, clerks habitually did so, and were in the happy position of being able to say, "If you kill or maim me, hell waits for you; if I kill or maim you, the bishop's prison waits me." It is not surprising, therefore, that all scholars claimed and were allowed the benefit of clergy, and that "clerk" is used indiscriminately for "scholar" and *vice versa* where any question of learning is concerned. Strictly speaking, the scholars were a particular kind of clerk, and from 1180 to 1500 we find the term "scholars-clerks" (*scholares clericis*) used as a term of art for the scholars for whom endowments were given by the founders of university or school exhibitions or colleges (*q.v.*). The most notable instance of it is that to the present day the legal corporate title of Winchester College is "the Warden and Scholars Clerks of Saint Marie College of Wynchestre." Whether it means clerks who are scholars or scholars who are clerks is not clear. It is certain that when they attained the age of 15, the scholars of Winchester were obliged to undergo the first tonsure. At Pontefract, St. Nicholas Hospital had to find forty loaves a week for poor scholars. In Inquisitions in 1267 they appear as *escolers del escole*, in 1437 as *secularibus clericis pauperibus*, in 1464 as *poor secular clerks*, if the two last are not properly read *scholaribus clericis* and *scholar clerks*. Thus in the fifteenth century Latin-English vocabularies, published by T. Wright, we find *Nomina dignitatum clericorum*, the names of the ranks of clerks. After *Ostiarius*, usher, comes *hic scolaris* a scolar, *hic clericus* a clerke, *hic discipulus* a disciple in one, and after 'sophister' and 'bachelor' in the other, *clericus*, a clerke, followed by *scolaris*, a scolar. Schoolboys were often spoken of, not as clerks, but as little clerks, *clericuli*, *clergeons*. So the famous grammar in verse of Alexander of Dol, written about 1240, which ruled the schools for some three centuries, begins: "I prepare a lesson-book for little clerks who are new to learning" (*Scribere clericulis parv doctrinale novellis*); and on the foundation stone of Giggleswick Grammar School, Yorkshire, is inscribed, "For priests also for little clerks this house is made in the year 1512" (*Preshiteris quoque clericulis domus hic fit in anno 1512*). So, in the *Prioress' Tale*, Chaucer's 'litel clergeon, seven years of age' was a scholar in a Song School which taught reading and singing but not grammar. At the universities, the privileges of clerks were extended to every one who served the scholars, whether as servants or tradesmen.

The meaning of "clerk" has fallen from its high estate; though the Clerk of Parliaments is still a high official, and, in legal documents, a priest of the Established Church is still described as a "clerk in holy orders," neither would be pleased if described as a clerk, *tout court*, a person who makes entries in a book and writes letters from dictation.

W. S. M.

**CLEVELAND, CITY OF.** — The largest city in the state of Ohio, and a large commercial and manufacturing center. Incorporated as a city in 1836. In 1900 the city had a population of 381,768; its estimated population in 1909 was 506,938. Of the total population of 1900, 33 per cent were foreign born, and 1.5 per cent of the colored race. Of the foreign born of 1900, 33 per cent were Germans, 15 per cent English, 11 per cent Bohemians, 10 per cent Irish, 8 per cent Huns, 7 per cent Poles, 3 per cent Italians, and 3 per cent Russians. The school census, 6 to 21 years of age, was 128,045 in 1908, and the total school enrollment in 1909 was 69,761 in day schools and 5667 in evening schools. The enrollment in private and parochial schools was 26,569 additional.

**History.** — The first school in Cleveland was opened in 1800, for the five children of the three families then residing there. This was a private school, as were all the schools up to 1836. In 1816 the town built a school building, which was supplied, rent free, to a teacher who maintained a tuition-school in it, admitting a few pauper children free. In 1821 the citizens built a two-story brick building for a higher school, then called the Cleveland Academy, which was let out on similar terms. In 1836 the city was organized and chartered, and the first free school was opened in the same year. By the terms of the charter, the City Council was to appoint a Board of Managers of Common Schools, for one-year terms, who were to manage the schools established. The Council was directed to provide for schools by the levy of a tax of not over one mill for sites

and buildings, and not over one mill for maintenance. The School Board was thus, in the beginning, little more than a subcommittee of the City Council. By 1838 there were six free schools, with 840 pupils; and by 1842 there were fifteen schools, with 1200 pupils. In 1841 the supervision of the schools was placed in the hands of an Acting Manager, who was also a member of the Board and its Secretary; and in 1853 the office of Superintendent of City Schools was created. In 1846 the Central High School for boys was established, the first in the state, and in 1847 a department for girls was added. Both of these schools encountered great opposition at the time. In 1850 an intermediate department was organized, and the schools were graded into four departments, — viz. Primary, Intermediate, Senior, and Central High. In 1856 the study of the classics was introduced into the Central High School, which up to that time had been an English high school. In 1864 the West Side High School was organized, and in 1872 the East Side High School. Since then four other high schools have been added.

In 1859 a Board of Education for the city was created by special legislation, to be elected by popular vote, one from each ward, and one half each year. This took the place of the old Board of Managers appointed by the Council. The latter body still retained control of the finances, but it was required by the law "to support two high schools" and a sufficient number of other schools "to furnish a good common school education to all children" in the city. In 1868 the authority of the Council to control the finances was removed, and the Board of Education was allowed to levy its own taxes. Boards of Visitors for the schools were abandoned at the same time. This form of board organization remained in force until 1892. In 1861 gymnastics were introduced into the work of the schools; in 1864 vocal music; in 1869 German into all grades of the schools; in 1874 a city normal school was provided for; and in 1888 the first truant officer was appointed to enforce the compulsory education law.

In 1892 a new plan of school organization, known as the Cleveland plan (*q.v.*) or Federal plan, was provided for by special law. The old Board of Education was abolished, and a School Council of seven members, elected at large, took their place. This was a legislative body only, and all executive functions were centered in a School Director, also elected by the people, who selected the City Superintendent and all subordinates. In 1904 and in 1908 general state laws with reference to city school systems caused a still further change in organization, resulting in the adoption of the present plan.

**Present System.** — As at present organized, the city school system of Cleveland is as follows: A Board of Education of seven, elected at large, on a separate school ticket, for four-

year terms, now controls the schools. The election of all executive officers, including the School Director, is placed in the hands of this Board. A Clerk attends to all secretarial and clerical duties. A Director, elected for two-year periods, acts as the executive officer of the Board in the conduct of all business. (See article on CITY SCHOOL ADMINISTRATION, and CLEVELAND PLAN.)

The Superintendent is appointed for five years, and acts as the executive officer of the Board in all matters relating to instruction and discipline. He appoints all teachers, subject to confirmation by the Board, for from one- to four-year terms, and has control of the work of the schools. The Superintendent is assisted in his work by two Assistant Superintendents, and special supervisors of English, German, manual training, arithmetic, kindergartens, penmanship, geography and history, language and substitute teachers, physical education, music, and drawing. A Board of Examiners examines and certifies all teachers for the schools. The merit system of promotion is used for the teachers in both the elementary and the high schools, and a system by which both experience and efficiency are recognized in making salary increases is employed. A teachers' pension fund, formed by the setting aside of 1 per cent of the total income for schools by the Board of Education, and of \$20 each year by the teachers, exists for the pensioning of teachers.

The school system consists of a normal school, a technical high school; 6 other day high schools, with art and manual training departments; 80 day elementary schools; 42 kindergartens; 7 centers for manual training and cooking; 4 evening high schools; 50 elementary evening schools; 1 school for the deaf; 10 schools for defective children; 6 schools for backward children; 1 epileptic school; and 1 boys' detention home. Manual training, drawing, and applied arts are taught in all grades of the school system. School gardens, summer schools, and medical inspection are provided. In 1908-1909 the system employed 117 supervisory officers, 1952 teachers in day schools, and 134 teachers in evening schools. At the beginning of 1905 the school accommodation became ample for the first time in years, and rented basement rooms were abandoned.

The total cost of the system for maintenance was \$2,638,010. About 90 per cent of the cost of the schools comes from local taxation. The Board's estimate of the amount necessary is submitted to the City Tax Commission for approval, but the Mayor and Council do not pass on it.

**CLEVELAND PLAN, THE.**—A term applied to the form of school government instituted in Cleveland in 1892, and recommended substantially in the Cleveland form in the report of the subcommittee on the organization of city school systems of the Committee of Fifteen (*q.v.*) of the N.E.A., in 1895. The plan has frequently been termed the "Federal plan," because of the double authority involved. The essential features of the plan were as follows: A School Council, or Board of Education, of seven members, elected at large for two-year terms, were, in connection with a School Director, to have entire charge of the schools of the city. All legislative power and authority were vested in the School Council. It provided for the employment of all teachers and employees, and fixed their compensation; adopted textbooks; approved all contracts for more than \$250 for general expenses, and for more than \$1500 for repairs; made all appropriations; and adopted general regulations of a legislative nature. The members of the Council were to be paid \$260 a year for their services.

A School Director, also elected by the people for a two-year term, acted as the chief executive officer. He attended all meetings of the School Council and participated in the proceedings, but had no vote. All acts of the School Council, however, which involved the expenditure of money or the purchase, sale, lease, or transfer of property, or the levying of any kind of a tax, or the change or adoption of any textbook, required the approval of the Director also, though his veto could be overcome by a subsequent two-thirds vote of the School Council. The School Director could make contracts and purchases up to \$250 at any time. He selected and nominated the Superintendent of Instruction to the School Council, and appointed or employed all employees of the school department except supervisors and teachers, who were nominated by the Superintendent of Instruction. The heads of the executive departments, apart from the Superintendent of Instruction, were a secretary, clerk, Superintendent of Buildings, truant officer, chief carpenter, and an Attorney. The Director devoted all of his time to the work of his office, and was paid a salary of \$5000 a year. He accepted or rejected all bids, approved the purchase of all supplies, determined the fitness and competency of all employees, and was charged with the execution of the general laws and of the rules and regulations of the School Council.

The Superintendent of Instruction, nominated by the Director and confirmed by the Council, held office during good behavior. To him was given the sole power to appoint and discharge all supervisors and teachers. He reported to the School Director concerning all matters under his supervision.

The Cleveland law aimed to secure a complete separation of legislative and executive functions; to define clearly the powers and duties

of each department; to introduce good business methods into the management of the schools; and to concentrate and fix responsibility. The city was fortunate in the selection of its first School Director, and for a time the system worked well. The double system of checks was at first regarded as a great merit of the system. A plan of organization essentially the same as the Cleveland plan was approved by the majority of the subcommittee of the National Education Association, and the merits of the Cleveland plan received much notice in the educational press for some years.

After ten years of trial the merits and the defects of the Cleveland plan became more apparent. The idea of separating the legislative and executive functions has been generally accepted as a wise change, and has been more or less completely adopted in almost all of the reorganizations of city school systems which have taken place during the past fifteen years. The position of School Director, or Business Manager, has also been incorporated in some form or other in nearly all of the recent revisions. The election of the School Director by the people, however, has not been accepted by other cities, and, in 1904, was discarded as unsatisfactory by Cleveland itself. The Business Manager ought to be a business expert, and business experts of any kind cannot be obtained with any success by popular election. The plan of allowing the Business Manager to appoint the School Superintendent and pass on his competency and efficiency eventually worked disastrously in Cleveland, and has not been tried elsewhere. The plan of giving the Director a power of veto on the acts of the Board, thus establishing a system of checks and balances, has also been discarded as unwise. To secure efficient school administration some one must be given power and be trusted, and the proper body to receive such power is the Board of Education. The reorganization accomplished in Cleveland, under the law of 1904, remedied the bad features, while retaining many of the best features of the original plan. (See CLEVELAND, CITY OF, for present plan. Also see article on CITY SCHOOL ADMINISTRATION.)

The Cleveland plan of 1892 was a pioneer, and marked a distinct advance toward proper business and educational management for our large city school systems. It naturally contained imperfections which time would correct. The report of the Chicago Educational Commission (*q.v.*) was in part framed, and the more recent reorganizations of the school systems of Boston and St. Louis have been accomplished, in the light of Cleveland's experiences.

**CLIAS, PHOKION HEINRICH** (1782-1854).—One of the pioneers of the physical education movement in Switzerland; was born in Boston as the son of a Swiss. From 1806 to 1811 he taught gymnastics in Holland, Germany, and Switzerland. In 1814, as officer of artillery in Bern, he introduced physical training in his company. In 1815 he became director of the physical training at the academy in Bern; in 1817 he went to Paris, where he published his *Gymnastique élémentaire*, a graded course of exercises for the developing and strengthening of the human organism. His book was approved by the Paris Society of Medicine. In 1822 he was called to England, where he was made Superintendent of Gymnastics at the military and naval schools of Sandhurst, Woolwich, and Greenwich. In 1827 he returned to Switzerland, and from 1841 to 1848 he taught gymnastics at Besançon and Paris. He died at Coppet, Switzerland. Among his works are: *Anfangsgründe der Gymnastik oder Turnkunst (Elements of Gymnastics)*, Bern, 1816, which is largely influenced by Guts Muths' (*q.v.*) *Kalithenic oder Übungen zur Schönheit und Kraft für Mädchen (Calisthenics, or exercises for the development of beauty and strength in girls)*, Bern, 1829, the first German work treating of physical training for girls; *Traité élémentaire de gymnastique rationnelle* (Geneva and Paris, 1853).

**CLOAK ROOMS.** — See ARCHITECTURE, SCHOOL.

**CLOISTER SCHOOLS.** — *Kloster Schule* is a German term for the school of the novices and *oblats* in a monastery. It seems to make its first appearance in Ekkehard IV's account of the school at St. Gall in Switzerland; where the *schola claustralis* is distinguished from the *schola canonica*. It is by no means clear from his account whether the latter means the bishop's cathedral school or an assumed "outer school" of the monastery, for canons' or secular and lay persons' children. But the whole account, written 200 years after what it purposes to describe, is too romantic to be entirely acceptable as an authentic account of what went on at St. Gall. If the writer meant to describe the monks as teaching a school for outsiders within the precinct, the account is in direct conflict with the law, and without independent contemporary evidence cannot be accepted. The inner novices' and oblates' school

is accurately enough called the cloister school, as in historical times it was held in the cloister, and when the cloister was, as was generally the case where the lie of the ground and other circumstances permitted, to the south of the church, the school was in the northwest corner. At Westminster the place of the school in this position is still marked by the solitaire boards carved in the stone seats running round the cloister. It was the warmest and sunniest spot in the cloister. At Canterbury, where the cloister is on the north, the school was at its southwest angle. The school was not so much a school of learning as a school of the rule of the order. The master was called *magister ordinis*, and his chief duty was supervision and the teaching of the rule by heart and its observance in effect. In the eleventh century constitutions of Lanfranc for the government of monasteries elaborate directions are given as to the custody of the *oblats*, children offered by their parents and being bred up in the monastery. They are never to be allowed to speak to a monk except the abbot or prior, or by special leave of the abbot, and in the latter case the master is to sit between the speaker and the boy. In general they are to sit so as not to touch each other or let their clothes touch each others'. They must not make a sign or speak to each other without leave. Out of school they may only talk to each other so that the master can hear every word. The same stringent rules apply to them when they cease to be boys and become youths, *i.e.* over 14, and to those who then newly come from the world to become monks. Not a word in either case is said as to what they are to be taught, the only thing specifically mentioned being reading; though elaborate provision is made for their singing with their master all night round the corpse of a dead monk. Of course reading and singing and understanding the rule implied the teaching of sufficient Latin to do these things. But the merest modicum of Latin sufficed. When we find Papal Bulls in 1304 and 1335 issued to impress on the monks the necessity of learning and ordering them to have grammar masters, seculars, if need be, introduced to do so; when we find bishops so far apart as Wykeham (1383) and Warham (1504) complaining that the monks of their cathedral monasteries, the premier churches of the kingdom, Canterbury and Winchester, made havoc of the lessons in church by false quantities and through not understanding what they were reading, and ordering them to provide secular grammar masters; when in the visitations of Norwich diocese, 1495-1504, complaint is made in almost every monastery of the neglect of learning and the lack of schooling; and when we regard the account given by Chaucer of the monk "why should he study to make himself woode," — it cannot be supposed that the cloister school was a house of learning in any but the most meager and perfunctory sense. Even when the colleges were set up

for them at the end of the thirteenth century and Papal statutes were passed in 1335 ordering under stringent penalties each Benedictine monastery (and a year or two afterwards the same was applied to the Augustinian canons' houses) to send 5 per cent of each house to the university, even the greatest monasteries failed to obey the statutes in their integrity, and many did not obey them at all. Regarded as schools, too, the cloister schools contained so few students that they were not a school at all in our sense of the word. Even in the great cathedral monastery of Durham the writer in Elizabethan days of the *Rites of Durham*, who pours *couleur de rose* over everything, says that there were only six at a time in the novices' school, and they must of course have been of very different ages. In the obedientiary Rolls of Winchester there were sometimes none at all in the youths' school, as it was called, and never more than ten. The cloister school looms large in late writers, especially among the *laudatores temporis acti*. Except in the Carolingian epoch, it was a small and insignificant thing, and had no influence on the general public, and contributed little to the advancement of education in the world.

See CONVENT SCHOOLS; MONASTIC SCHOOLS; MONASTIC RULES, EDUCATIONAL PROVISIONS IN.

**CLOSETS, SCHOOL.** — See LATRINES.

**CLOTHING OF SCHOOL CHILDREN.** — The kind of clothing for school children must be determined by many considerations, such as the custom of the community, the climate of the locality, the temperature likely to be found in the homes, and the temperature of the schoolroom. Only the most general hygienic rules can be given. It seems better, however, that the schoolroom should be at a relatively low temperature, not more than 68° F., and that the children should be sufficiently clothed so as to be comfortable at such a temperature. While the children of the poor are often too thinly clad, a common fault among the well-to-do is that of clothing their children too warmly. The result of the overheating of the body in this way is weakening; it is likely to retard school work, and on exposure to drafts colds are liable to be contracted.

On the other hand a child should not be exposed to the cold by insufficient clothing. It is estimated that more than 80 per cent of the heat generated in the body is given off by the skin, and on account of the relatively greater surface of the child's body as compared with that of the adult this irradiation of heat from the skin is relatively greater in case of the child. This fact offsets in part the greater functional activity of the child's body.

The difficulties encountered by teachers in regard to the clothing of children are liable to be serious. Some children are clothed too warmly, others too lightly; the clothing of

many is dirty; and in some cases the atrocious habit of sewing children up for the winter prevails. Until the community is better educated, the best method seems to be that of having school baths, which is a sure remedy for the sewing up habit; and according to German experience likely to bring about an improvement in the cleanliness of the underclothing worn by the pupils. In all such cases, however, hygiene has to reckon with morals, and suitable tact must be exercised by teachers to avoid casting discredit on the authority of parents and weakening the respect of children for them.

A few obvious matters should receive attention. The head covering should be light, porous, and convenient. The underclothing should be, even for severe climates, relatively thin, and should be either of wool or linen. White color is desirable, so that soiled clothing will be easily seen. All clothing that binds the body should be avoided, — tight collars or the like about the neck, inflexible and ill-fitting corsets, too tightly fitting drawers, tight belts, and tight garters and stockings, and shoes which are too small or which do not conform to the shape of the foot. A great deal of suffering, from flat foot, overlapping of the toes, bunions, and the like, is caused by unsuitable shoes and stockings. It is especially necessary that the foot clothing should be of such kind that the toes move freely and that no distortion of the foot is produced.

The essentials of suitable clothing for children can be summed up, then, in a single sentence. The clothing should be loose, should not bind any of the organs of the body, and should give opportunity for free muscular movement; it should be simple, and warm or thin according to the climate, and of such a character that it can be kept clean.

**CLOUGH, ANNE JEMIMA** (1820-1892). — Founder of Newnham College (*q.v.*), Cambridge, England, 1871, and prominent supporter of the movement for education of girls. In 1873-1874 she was president of the North of England Council for the Promotion of Higher Education of Women, an association of which she had previously been the secretary.

**CLOVESHOO, COUNCIL OF.** — The Provincial Synod at Cloveshoo, near Rochester in Kent, held in the year 747 and attended by Cuthbert, Archbishop of Canterbury, and other bishops, is of great importance in the history of English education, as at this council the first extant Saxon canon or enactment relating to English education was promulgated. The seventh canon was an organized effort to dis-

seminate through the land the educational ideals introduced by Theodore (*q.v.*) and Adrian (*q.v.*) eighty years before. It is important to note that the canon clearly refers to the education of girls as well as boys, and that it is addressed to bishops as well as heads of houses. It should be considered as the connecting link between the work of Theodore and that of Alcuin (*q.v.*) and of Eugenius II. The canon is entitled, "Concerning the study of reading throughout the single monasteries," and runs as follows: "That the Bishops, Abbots, and Abbesses should strive with every endeavour and diligently look to it that throughout their households many may spread abroad and very many may assiduously pursue the study of reading to the profit of their souls and the glory of the eternal king. For with lamentation it must be said that very few persons are now to be found who in their inmost hearts are ravished with the love of sacred learning. Men will scarce spend any labour in learning, nay rather are they possessed from their youth up with all manner of vanities and with the lusts of idle glory, and, in the error of their hearts, rather follow after the instability of this our mortal life than the steadfastness of the Holy Scriptures. Therefore let children everywhere in the schools be compelled to address themselves to the love of sacred learning that they may be found henceforth well instructed, so that they may render to the church all manner of service and that the Honor of God may not, through the devotion of the governors to the works of this world, be brought into derision and left bare of spiritual ornament." (For Latin text, see Haddon and Stubb's *Councils and Documents relating to Britain and Ireland*, Vol. III, pp. 364-365.) J. E. G. DE M.

See ABBEY SCHOOLS; CLOISTER SCHOOLS; CANON LAW, EDUCATION IN.

**CLUNY.** — A Benedictine monastery established near Macon on the borders of Burgundy in 910 by William of Aquitaine. Berno was the first abbot, and was succeeded by Odo, who spread far and wide the influence of Cluny, which stood under reformed rules. Cluny was one of the wealthiest of the monasteries of that age. A cloister school was maintained in connection with the monastery, and great care and vigilance was exercised over the pupils of the school. St. Ulric, who wrote the *Customary* describing the rules of the house, says, "I think it would be difficult for a king's son to be brought up in a palace with greater care than the humblest boy enjoys at Cluny." Although Odo is known to have had a knowledge of Vergil, Priscian, St. Augustine's *Dialectica*, and Capella, and some acquaintance with Greek, he exercised his influence against the reading of the classics, and for a long time this position was maintained not only at Cluny but at other monasteries affected by it. Still much copying of manuscripts was done by the monks.

**COAKLEY, GEORGE WASHINGTON** (1814-1893). — Educator and textbook writer; graduated from Rutgers College and was subsequently professor of mathematics at St. James College (Maryland) and New York University. Author of textbooks on astronomy and physics. W. S. M.

**COBURN, CHARLES RITTENHOUSE** (1809-1869). — Schoolman; educated in the common schools of Pennsylvania, and for 30 years principal and superintendent of schools in that state. He was editor of the *New York Teacher* from 1852 to 1854 and superintendent of public instruction in Pennsylvania from 1863 to 1866. W. S. M.

**COCHIN CHINA.** — See FRENCH COLONIES, EDUCATION IN.

**COCHRAN, DAVID HENRY** (1828-1909). — Educator; graduated from Hamilton College in 1850. He was instructor of science in the Clinton Liberal Institute, the Fredonia Academy, and the State Normal School at Albany, and principal of the latter institution from 1855 to 1864. From 1864 to 1900 he was president of the Brooklyn Polytechnic Institute. He was active in the evening school movement and in the work of humane societies. W. S. M.

**COCKFIGHTING IN SCHOOLS.** — It is difficult to find a complete explanation of the once almost universal practice of cockfighting in schools on Shrove Tuesday. It existed from very early times in England, Scotland, and France. Cockfighting seems to have been introduced from the Mediterranean before the Roman invasion, and it may with some reason be suggested that cockfighting was one of the many customs that was handed down from the Roman Imperial Schools to the schools of England and France (cf. the Roman school holiday, *Quinquatria*, on Mar. 20). A very early account is contained in the famous *Description of London* written by William Fitzstephen (who died c. 1191) in the second half of the twelfth century. His account runs as follows: "Furthermore in each year on the day which is called Shrove Tuesday, to begin with the games of boys in London (for we have all been boys), each boy in the school brings a fighting cock to his master, and the whole of that forenoon is given up to a holiday to watch the cockfights in the school. After dinner all the scholars go to a field outside the town to the well-known game of ball. The scholars in each of the courses have their own ball." In England the custom extended to adults, but in France it was limited to schools and was at last forbidden in grammar schools by cap. 7 of the Council of Copria (Cognac?) in 1260 (see Du Cange's *Glossary*, Vol. II, 1679). For descriptions of Shrovetide cockfighting in Scottish schools see

*Northern Rural Life* by Dr. William Alexander (ed. 1888, ch. xxii). It was abolished in Wemyss school in 1748 by John Grub, but survived in Scotland at any rate till 1820. It existed at the Manchester Grammar School at least as late as 1815 (see *Notes and Queries*, 8th Series, Vol. VII, pp. 338, 473-474). At the Wreay Free School (near Carlisle) there was a cockfight on Shrove Tuesday for a silver bell from the year 1655. This was abolished in 1786 (Carlisle, *Endowed Grammar Schools*, Vol. I, p. 205). The silver bell was also fought for at Bromfield school (see Hutchinson's *History of Cumberland*, Vol. III, p. 322). Cockfighting was forbidden by the statutes of St. Paul's School of 1518. The *Cock-penny* is associated with the school cockfight, and this gratuity to the masters (which resembles the gratuities paid to teachers in the Roman Imperial Free Schools) is an additional reason for connecting the cockfighting with Rome. At Lancaster School the cock-penny was paid by the free scholars at Shrovetide. The master took seven twelfths and the usher five twelfths of the proceeds. The cock-penny was also paid at Hawkshead School, Clitheroe School, Burnley School, Wye School (see Brand's *Popular Antiquities of Great Britain*, Vol. I, p. 72 and p. 431). At the very ancient school of Whiteham and Millom in Cumberland tuition was quite free except a gratuitous offer, entirely at the option of the parents of the children, called a "Cock-penny" at Shrovetide (Carlisle, *Grammar Schools*, Vol. I, p. 198). The ancient rate-supported grammar school at Crosthwaite or Keswick was a cockfighting school (*ibid.*, Vol. I, pp. 178-180). Cockfighting is related in some way to the ancient school *saturnalia* called "Barring Out" (*q.v.*). This took place three days before Lent. The master was deposed and excluded from the school. Cockfighting and football followed. This was at Bromfield School (see Hutchinson, Vol. III, 322, and Brand, Vol. I, pp. 441-454). Barring out was a common practice (see Durham, Houghton, Le Spring, and Lichfield schools; Brand, Vol. I, p. 441; II, p. 71). The whole business is clearly of classical, probably Grecian origin. In Germany the practice of presenting the teacher with a cock or monetary equivalent on Palm Sunday was frequent, as well as a gift of money before each holiday. (See Fischer, *Geschichte des deutschen Volksschullehrerstandes*, Berlin, 1898.)

J. E. G. DE M.

**COCKER, EDWARD** (1631-1675). — An English teacher famous for his arithmetic text book, which is supposed to date back to 1664, and is said to have gone through 100 editions (*Dict. Nat. Biog.*). He was considered to have laid down the law with regard to arithmetic so that the expression "According to Cocker" has become familiarized to express a statement which is too authoritative to be contradicted. On the value of Cocker's book and the question of its authorship, see De Morgan's *History of*

*Arithmetical Books*, p. 56. The copies now found are revised by John Hawkins, writing master in Southwark, and issued under the title *Cocker's Arithmetick*, licensed Sept. 3, 1677, who states that the work proceeds from the "author's correct copy" which may mean that it had previously been in Ms. till published by Hawkins. At any rate it is printed with Edward Cocker's Preface. "Practical Arithmetie," he says, "is the soul of Merchandise," and he has throughout considered "the numerous concerns of the honored merchants." The book is also intended for teachers, "whose understandings soar to the sublimity of the theory and practice of this Noble Science." John Collins, a famous mathematician of Hawkins' time, and fifteen (chiefly) teachers recommend the book, which is, they say, "generally approved by all Ingenious Artists." As to the *practical* nature of Cocker's book, Mr. Ball says (*Short History of Mathematics*) that "until the time of Cocker (1677) there was some discussion of the principles involved; since then, very few arithmeticians have attempted to justify or prove the processes used, or to do more than enunciate examples and illustrate their use by a few numerical examples." Cocker also compiled an English dictionary.

Cocker was a writing master by profession, and in his own day had much more renown as a teacher of writing than of arithmetic. He published over a score of manuals of penmanship. On his merits as a writing schoolmaster, see Wm. Massey's *Origin and Progress of Letters* (1763). F. W.

**COCKERTON JUDGMENT.** — A *cause célèbre* in English educational law and administration. In order to supply the lack of secondary schools the practice had grown up toward the end of the nineteenth century by which school boards instituted classes for adults and children in evening and day schools in subjects beyond the curriculum of the elementary school. These courses were maintained out of the public rates and received grants from the Science and Art Department. The result was that elementary schools practically were under the dual control of the Education Department and the Science and Art Department. In 1900 Mr. Cockerton, district auditor under the Local Government Board, refused to allow certain expenditures on classes beyond the elementary school curriculum which had been incurred by the London School Board. The case was taken to the law courts, and the Court of Appeal upheld the decision that the school boards had acted beyond their powers in maintaining higher education out of public rates.

The immediate consequence of this judgment was to draw public attention to the inadequate provision of secondary education. By the Education Act of 1901, authorities were permitted to continue for a year any school

which had violated the law. The Education Act of 1902, however, remedied the confused state of things by empowering local authorities to raise money for secondary and evening continuation schools.

It was further brought out during the proceedings on this case that nowhere in the English Education Acts was there a definition of elementary education. The act of 1902, however, remedied the deficiency by defining the elementary school and its scope.

**CODRINGTON COLLEGE, BARBADOES.**

— See WEST INDIES, BRITISH, EDUCATION IN.

**COE COLLEGE, CEDAR RAPIDS, IOWA.**

— A nonsectarian, coeducational institution, originated in a school kept in his own house by Williston Jones, a pioneer Presbyterian pastor in eastern Iowa. In 1853, upon the solicitation of Mr. Jones, Daniel Coe, of Durham, N.Y., gave \$1500 to the school, which had been incorporated in 1851 as the "Cedar Rapids Collegiate Institute." In 1867 the name was changed to "Parsons Seminary," and a main building was erected. In 1871 the name was again changed, this time to the "Coe Collegiate Institute." In 1880, chiefly through the efforts and gifts of a trustee, Mr. Thomas M. Sinclair, the institute became free of debt, and was placed under the control of the Synod of Iowa, North. The name became Coe College, and the institution was made of college grade in 1881. From Oct. 31, 1893, the charter prescribed that the Synod of Iowa should have a veto power over the election of the 10 members chosen annually by the board of 30 trustees. On June 9, 1908, the Board passed an amendment accepting action by the Synod, which relinquished all control over the election of trustees. Coe College was then accepted by the Carnegie Foundation for the Advancement of Teaching (*q.v.*) as a nonsectarian institution participating in its system of retiring allowances to professors. Since 1881 the presidents have been: Stephen Phelps, 1881-1886; James Marshall, 1887-1896; S. B. McCormick, 1897-1904; and W. Wilberforce Smith, 1905-1908.

The year 1901-1902 was devoted to efforts to increase the productive endowment of the college by \$150,000, stimulated by a conditional gift of \$25,000 from Mr. Ralph Voorhees of New Jersey. Immediately following the success of these efforts, funds were obtained whereby, in 1904, the gymnasium was built and equipped, and the president's house was rebuilt. In July, 1907, there closed another campaign based upon conditional donations of which the largest were \$45,000 (later increased to \$63,500) for a

Science Hall, from Mr. Andrew Carnegie, conditional on raising \$45,000 for a new science endowment; and \$50,000 for endowment from the General Education Board, conditioned on securing a total of \$250,000, besides paying the debt which accumulated during the years of effort for endowment and amounted to \$13,000 by the close of this campaign. The full amount raised was in excess of \$293,000.

The productive endowment is \$237,123.75; the total annual income is \$28,137.44. There is an outstanding debt of \$28,800. The average salary of a professor is \$1270. There are (1909) 30 members on the instructing staff, of whom 12 are full professors. The student enrollment is 338, divided as follows: college, 243; academy, 75; summer school, 47. C. G.

**COEDUCATION.** — Historically, public education has first developed for the service of boys.

The training of girls has been a secondary consideration, or rather the education of girls was left to the home and church. Consequently the first colleges, secondary schools, and academies were established for boys. A notable instance of this is the German gymnasium, which only in very recent years has been developed for girls. Until well along in the nineteenth century, girls were regarded with disapproval in many American schools. When, therefore, the equal right of girls to public education was asserted, it was found that there were only boys' schools, and the demand for educational opportunities for girls was of necessity often a demand for coeducation. As a result of this demand, girls gradually made their way into the various departments of the school system. During the latter part of the nineteenth century, especially, this movement became very strong, and the desirability of coeducation was much discussed. Since the results vary extensively according to the grade of education concerned, it may, perhaps, be well to treat the subject from the point of view of each of the three great divisions of education.

**In Elementary Schools.** — In Germany coeducation has existed in elementary schools, to some extent at least, from the time of the Reformation. By the law of 1871 in Prussia, the Volksschulen were advised to separate the sexes wherever possible, except when there were only two teachers in the school. However, three tenths of the city school children are in mixed classes, and in the rural schools, inasmuch as the separate plan is too expensive for most country districts, two thirds of the children are in classes for both sexes. In France each commune having more than 500 inhabitants must establish a separate elementary school for girls, unless a mixed school is sanctioned by the provincial council. As a matter of fact, there are comparatively few coeducational schools in France, even in elementary education. The number of these seems, however, to be very slowly increasing. In Switzerland the ele-

mentary schools are for the most part coeducational, but in some cantons the course of study varies both in character and in length for the two sexes. In Sweden practically all the elementary schools are for both sexes. In Austria as many as 85 per cent of the public elementary schools are coeducational. In Italy about one fifth of such schools admit both sexes, and the law requires that if the sexes use the same building, they should have separate entrances and classrooms. In the lowest classes, however, this principle is frequently disregarded. Just as Italy aims to avoid coeducation, so do all the Romance nations, with the partial exception of France. Spain and the Spanish-speaking states of America do not favor mixed schools. In Brazil a limited experiment in coeducation in elementary schools was tried in a few schools, but the plan was abandoned. In England the extent of coeducation in public elementary schools has been steadily increasing. In 1908 more than 65 per cent of the departments into which these schools are divided have mixed classes. In Scotland 97 per cent of such departments are coeducational. In Ireland over 50 per cent of the public elementary schools are of this character. In Canada, except among schools for the French, and in Australia, except for a few city schools, coeducation is the rule in elementary education.

In the United States coeducation even in elementary education has grown up since the Revolution. For the most part in colonial times the girls gained whatever education they received from dame schools, special classes, the instruction of tutors, or various irregular methods (see COLONIAL PERIOD IN AMERICAN EDUCATION). In the latter part of the eighteenth century the plan of coeducation crept into the academies, as it had earlier into the elementary schools of New England, and ultimately it came to be the practice in public schools in general. To-day at least 96 per cent of the elementary pupils are in mixed schools. Only in a few large cities like New York is any attempt made to separate the sexes in the lower grades of instruction. Even here the separation is made on grounds of convenience in administration, discipline, etc., rather than because it is felt that separate education is the ideal method.

In general, therefore, so far as the United States is concerned, no question exists as to the feasibility, or, indeed, the desirability of coeducation up to the time of adolescence. Thus only for the last two years of elementary education can the issue of the wisdom of such education be regarded as serious. Moreover, if, as many think, these years are ultimately to be regarded as properly belonging to the secondary school, then the serious debate in regard to coeducation concerns secondary and higher education rather than that of the elementary grades. This view seems to be that to which other countries with advanced systems of popular education have

been gradually coming, if they have not already reached it. Communities in which elementary education is as yet not well advanced, or in which the ages of maturation of the sexes and of marriage are early, have as yet not become favorable to coeducation even in elementary education.

**In Secondary Schools.** — Coeducation in the American secondary schools is the result of two conditions: (a) the rise of a well-defined demand for equal opportunities for the education of girls with that of boys; (b) the need of economy of administration in the newer communities. The first was largely contemporaneous with the development of public high schools. The consequence is that, outside of certain large cities like Boston, Baltimore, New Orleans, San Francisco, and New York, coeducation practically prevails wherever public secondary schools are found.

Since the attendance on private schools in the United States is almost stationary and the public high schools are increasing rapidly, it is statistically true that coeducation is increasing in the United States. In 1906-1907 there were in the United States 678,000 children in coeducational public schools, and 45,000 in noncoeducational public schools; in private secondary schools, including those under religious auspices, there were 57,000 children under conditions of coeducation, and 49,000 in separate schools. For a series of years there has been almost no increase in public noncoeducational schools; whereas, nearly all new private schools have been founded for separate education.

In Great Britain, excepting Scotland and parts of Wales, separate education is almost the universal practice in the secondary schools; this is often true as well in the day secondary schools which are now being established, and also in the boarding schools which generally prevail. In a few cases small coeducational boarding schools exist, but they are still regarded as experimental. Scotch secondary education, for reasons analogous to those which prevail in the United States, has long admitted coeducation, and apparently without harmful results.

In Germany and France almost no coeducation exists in secondary schools. In Germany, as is well known, secondary education for girls is of very recent development, and almost universally is found in separate institutions.

Certain evils, once apprehended from coeducation, have not been realized. Girls have not proven intellectually inferior to boys, or unable to cope with the studies taken by the latter; they have not suffered physically as a result of the supposedly increased effort necessary to keep pace with the boys in their studies. Coeducation has not promoted early marriage, nor is it in evidence that it has tended to retard it; it has had no visible results in the way of impairing moral conduct.

The old objections to coeducation for children of secondary grade have proved groundless.

The problem has been for a number of years at rest in the United States; within recent years, however, it has been reopened, partly by the contributions of Dr. Hall. Changing conceptions of education, and an increased appreciation of adolescent development, have given rise to a number of questions which are still in process of discussion. The following arguments are being presented against coeducation in this discussion: (a) Coeducation renders difficult or impossible a suitable differentiation of studies, according to the physical, the vocational, and other needs of each sex. This assumes that education becomes, instead of merely a matter of mental discipline, a process equipping individuals with the ideas and training needful for the performance of their individual and social duties; it assumes that the social needs of women will differ somewhat from those of men. (b) In the secondary school period, that of adolescence, it is alleged that coeducation prevents the development of certain finer feminine qualities in the girl and some desirable virile qualities in the boy; from this point of view it is desirable that during the period of adolescence the sexes should go off apart, each developing individual qualities, and not suffering from contact with the other. This is a modified form of an older argument, and its validity is yet uncertain. It is evident that boys dislike to work in competition with girls, partly because of the precocity and earlier self-confidence of the latter. In the American secondary public schools nearly 60 per cent are now girls, and it is alleged that this preponderance is partly due to the lack of interest on the part of boys in the studies in which they compete with girls. It may be further noted that in large coeducational schools it is the belief of many principals that the social life becomes too intense, and acts as a deterrent to study. (c) While girls have not only proven equal to boys in their capacity to respond to the secondary school curriculum, but have even, in many cases, outstripped them, there still arises the question as to whether the physical health of the girl may not be permanently impaired by too close devotion to a program of studies designed for boys. The girl's capacity is undoubted, but her increased conscientiousness, and her inability to give practical interpretation to studies like mathematics and science, may easily render these sources of overwork to her.

Among the arguments which still seem valid for coeducation in secondary schools are these: (a) In all stages, and except in very large cities, it is more economical; it makes for democracy and equality between the sexes; it promotes the capacity and cooperative powers of men and women workers — an important fact, since in the United States more than 5,000,000 women now follow gainful occupations in co-operation or competition with men. (b) In the adolescent period, it undoubtedly pro-

motes a wholesome disillusioning as regards the relations of the sexes, and makes more possible informal intercourse such as business and social life require. It is a generally accepted belief in England that the coeducational schools have a more wholesome moral atmosphere than those on the separate basis.

Certain tendencies now at work in public secondary education are undoubtedly destined to give new aspects to the problem. (1) Modern education, especially of secondary grade, is rapidly widening; and its expansion follows four well-defined lines: physical education, vocational education, social or civic education, and cultural education. In the first two divisions co-instruction is, of course, largely out of the question. Standards, aims, etc., will vary widely. In the third, the content of the wider civic or moral education will certainly differ for boys and for girls in well-defined particulars; but in others it will be identical. Furthermore, the life of the school and its associations are a large element in social education. In cultural education there is no reason why the content and method should not be the same, with the proviso that a considerable part of secondary school mathematics, science, and art will be developed along vocational rather than cultural lines. (2) Secondary education will probably be pushed down into two years, therefore including the time in which boys and girls have most divergent development. (3) Owing to the large amount of new material to be incorporated into the high school course, flexibility in the shape of elective courses or subjects will doubtless tend to increase. (4) Again it must be noted that schools are increasing in size, thus making an institution resemble an aggregation of departments brought together for economy of administration, but not necessarily involving more than partial contact of all the members.

Secondary education tends also to begin earlier, and to approximate a period of six rather than four years. The consequence of these developments will probably be an extension of coeducation, but a measurable diminution of the necessities for more than partial contact in the schoolroom.

In the public high school of the future we may expect that certain classes will be pursued exclusively by the girls, and others by the boys; but that certain other studies, for economy of administration and social reasons as well, will be followed by both girls and boys. Under these circumstances, different tastes and interests will be consulted, and the necessities for physical overwork will be diminished. Each sex will have a curriculum adapted to its needs, but will be educated to a certain extent in the atmosphere of the other, thus combining the opportunities for moderate social intercourse with opportunities for the pursuit of studies along distinctive lines. (See also WOMEN, HIGHER EDUCATION OF.)

**In Higher Education.**—So far as university instruction is concerned, it is evident that women are being admitted into the institutions of the world wherever a strong demand has appeared on their part for such an opportunity. For such instruction coeducation has seemed the only method at all available. The expense of university instruction makes separate provision for women practically out of the question. The number of women who wish graduate or professional instruction, save for the purpose of preparing for teaching, would seem to be relatively small as compared with those who wish secondary education, which for the purpose of this discussion may be regarded as including in the United States collegiate education. Moreover, in the higher work of the university the maturity of the students and their intellectual attainments would seem to make the scholastic purposes of their common work so dominant as to exclude any disturbing influences from the association of the sexes. On the other hand, in the secondary schools since the students are more immature in character, since they are in the adolescent stage of development, when the interest in relations of sex is especially strong, and since the number of women wishing instruction is so great as to make separate schools possible, the question of the wisdom of coeducation is yet a living issue. In the United States, as we have seen, the high schools have become practically all coeducational. The struggle centers about the advisability of coeducation in the colleges, where the practice of the West is dominantly coeducational, while that of the North Atlantic states as yet favors separate instruction. In Europe secondary education has scarcely attempted coeducation even as an experiment.

**COEDUCATION, HYGIENE OF.**—In small country day schools coeducation is unavoidable, but there the conditions of living are healthier than in big cities, overpressure in education is hardly in question, and for the ages of children in the lower grades the differences in the develop-

ment of secondary sexual characteristics and qualities are of no great importance. It is a different matter in the high schools, and it is these only which are taken into consideration in the following remarks. (The European high schools quoted in the preceding article are day schools, only partly coeducational, and corresponding to high school and lower college classes combined in the eastern part of the United States.)

Investigation shows clearly a difference between the bodily resistance of the two sexes. After the way had once been opened by Hertel's work, the great investigation made in Sweden by Key in 1885, etc., proved that ailments were much more prevalent amongst girls than boys, though the latter were more burdened by school work. The investigation in a coeducational school in Finland (1896-1898) showed more school days missed by the girls than by the boys; the Helsingfors investigation (1890) and a later one made in eight small Finnish towns (1900), both in coeducational schools, also showed many more girls than boys exempt from obligatory gymnastics in consequence of medical examination.

A special difficulty in the question of coeducation arises from differences in the curve of bodily development. The Swedish investigations mentioned above show not only in all ages a higher rate of illness amongst girls, but also that the curve of ill health makes different oscillations at different ages in the case of boys and of girls; and a Helsingfors examination (1890-1891) shows that in the ages above 12 years, the increase of weight during the year differs in the two sexes and takes place with the girls principally during the holidays. The minor mass development of skeleton and musculature makes girls less able to resist certain noxious influences. With regard to gymnastic drill that difference has been taken into consideration for a long time now, independently of the question of coeducation. There is also difficulty in psychical respects. From the experience gained from the Antwerp investigations made by Schuyten we see that in coeducational schools with a heavy curriculum girls are likely to be more burdened than boys in consequence of the greater suggestibility of the girls. Other investigations have shown that boys and girls at different ages have different psychical ability.

So far as accurate investigation gives us reliable results, we see that ill health is much more prevalent amongst girls than boys during the development of puberty and the years immediately following, though that process itself, which is of great importance for the future life and for future generations as well, is really physiological, and can doubtless be passed through in a healthy way with reasonable care and attention to hygienic laws during childhood and also at the period in question.

Notwithstanding all these difficulties, coeducation is becoming more and more common,

and is being adopted by degrees in central Europe also, not because people are convinced that it is an ideal arrangement, but because it is much easier to obtain a higher education for girls in this way, especially in smaller places, where there is already a day high school for boys with sufficient provision for the admittance of girls.

From what we have seen above, scientific research gives us results concerning the general features of the question of health in coeducation, but these results are not sufficient to enable us to apply them practically at once to every detail of the curriculum, when it is a question of coeducational arrangement for every individual school. It should be a subject of care for teachers and medical inspectors to observe the state of health and the psychological development and variations in the schools, after having drawn up the special curriculum with due regard to the above results. The published results of such observations will be very valuable. In every case it may be the more healthful arrangement, when the curricula are heavy, to choose only a certain number of subjects as coeducational lessons and arrange a part of the curriculum in such a manner that the different physical resistance of the two sexes is taken into account as well as their different mental ability; with boys, the period immediately preceding the development of puberty, with girls, the period of that development itself and the years immediately following are those of minor resistance; as to the psychic side, it seems that after the development of puberty girls surpass boys of the same age.

The investigations by Ayres published in *Laggards in our Schools* have an important bearing on our subject. He sums up his results as follows: "There is 13 per cent more retardation among boys than among girls, and 13 per cent more repeaters among boys than among girls, . . . the percentage of girls who complete the common school course is 17 per cent greater than the percentage of boys. These facts mean that our schools as at present constituted are far better fitted to the needs of the girls than they are to those of the boys."

The literature on the subject of hygiene in coeducation is scattered and frequently published in the less familiar languages, like Swedish, Danish, Finnish. Little or no scientific investigation has been made concerning the subject in England or America, where the practice of coeducation is most common. The most important of these references are given below.

**COEFFICIENT.**—See GRAPHIC CURVE; STATISTICS.

**COGSWELL POLYTECHNIC COLLEGE, SAN FRANCISCO, CAL.**—Founded in 1887 to provide a training in mechanical arts and other industries to boys and girls of the state of California. Applicants are admitted on completing the eight grades of a public school of the state, or equivalent work. The first two of the four years' course are devoted in the case of boys to meet the academic requirements of higher technical and engineering schools; the last two years may be given up to a certain amount of specialization. The course for the girls is also general with manual work and drawing directed toward home economics. A diploma is given on graduation. There is a faculty of 12 instructors.

**COGSWELL, WILLIAM** (1787-1850).—Educator; graduated from Dartmouth College in 1811. He was a teacher in New York City, and for ten years was the general agent of the American Education Society (*q.v.*). From 1841 to 1844 he was professor of education at Dartmouth College. Author of works on religious education. W. S. M.

**COIMBRA, UNIVERSITY OF.**—The national university of Portugal. The Papal bull for the establishment of a *studium generale* was issued in 1290, and the university was located at Lisbon. Until 1537 the institution moved between Coimbra and Lisbon, but was then finally established at Coimbra, where it has remained ever since. Generally the Uni-

versity of Coimbra was modeled on that of Bologna (*q.v.*). A theological faculty was not established until 1411. The University of Coimbra has always enjoyed royal patronage, the King still being the Protector of the University and sanctioning appointments to chairs. Rashdall points out that Coimbra retains the medieval atmosphere and customs more than any other European university town. At present faculties are maintained in theology, law, medicine, and the sciences. A faculty of arts does not exist at Coimbra, but in 1859, a school was established at Lisbon and reorganized in 1901, to supply the deficiency (*Curso Superior de Letras*). In 1909 Coimbra had an enrollment of about 1500 students; the Lisbon course was attended by some 110 students.

**COLBURN, DANA POND** (1823–1859). — Schoolman; educated in the common schools of Massachusetts and at the Bridgewater Normal School. He taught in the schools of Massachusetts for five years; served as institute instructor for the Massachusetts State Board of Education, and for two years was an instructor in the Bridgewater Normal School. He was principal of the Rhode Island Normal School from 1854 to 1859. Author of *First Steps in Number* (1847), *Arithmetic and its Applications* (1855), *Common School Arithmetic* (1858), and *Intellectual Arithmetic* (1859). W. S. M.

**COLBURN, WARREN** (1793–1833). — Schoolman and textbook writer; educated in the common schools of Dedham and graduated at Harvard College in 1820. He was for a number of years principal of a private school in Boston. His *First Lessons in Arithmetic*, published in 1821, was for more than half a century one of the most widely used school books in America. He published a *Sequel to the First Lessons* in 1824, and subsequently a series of school readers and a textbook on algebra. He was one of the founders of the American Institute of Instruction (*q.v.*), before which association (1830) he read his famous pedagogical treatise on the teaching of arithmetic. W. S. M.

**COLBURN, ZERAH** (1804–1840). — A juvenile mathematical prodigy whose father refused him a collegiate education that he might exhibit the lad for monetary considerations in America and Europe. His father died in England, and Zerah was placed first in the Westminster School and later in a lycée in Paris. Upon reaching adolescence he lost his power of mathematical calculation. He became upon his return to America first a teacher of French and later an itinerant Methodist preacher. See the *Memoir* by himself (Springfield, 1833).

**COLBY COLLEGE, WATERVILLE, ME.** — A coeducational institution, chartered Feb. 27, 1813, as a result of the efforts of Baptist churches in the state of Maine. On June 12, 1815, the trustees were authorized by the legislature of Massachusetts to "locate in any town within the counties of Kennebec and Somerset"; Waterville was selected. The Theological Department, established here July 6, 1818, was followed by the literary department, organized in October, 1819. On June 28, 1820, the state legislature appropriated to the institution the sum of \$1000 annually for seven years, stipulating that at least one fourth of the sum should go toward the reduction of the tuition of deserving students. On Feb. 5, 1821, the name was changed to Waterville College. Small success followed the efforts of an agent appointed in 1859 to solicit subscriptions for the endowment fund, until in August, 1864, Mr. Gardner Colby of Boston subscribed \$50,000 on condition that \$100,000 additional should be secured. Upon the fulfillment of this condition, the trustees, on the suggestion of President Champlin, voted to change the name to Colby University; the legislature made this the official title, Jan. 23, 1867. Including a bequest received after the death of Mr. Colby in 1879, the benefactions of this patron amounted to \$200,000. On Jan. 25, 1890, the trustees decided that the name "university" was inappropriate, and the unusual but obviously sensible step was taken of changing the corporate title to its present form, "The President and Trustees of Colby College." Women were admitted in 1871. Colby College is controlled by a Board of Trustees of 30 members, 7 of whom are chosen annually by the Board; 9 trustees are elected annually by the alumni. Each trustee serves 3 years.

The degrees given are A.B. and B.S. After the freshman year, the studies are largely elective. In January, 1908, the curriculum was largely added to by new courses in science, in preparation for engineering, architecture, and medicine. Colby College has the life of the "small college," centering largely in the fraternities, which include practically the entire student body. The fraternities established include: Delta Kappa Epsilon, Zeta Psi, Delta Upsilon, Phi Delta Theta, Alpha Tau Omega, Sigma Kappa. All the chapters occupy houses; a unique experiment was the assignment in 1907 of portions of college dormitories for chapter houses. In this way, for instance, the Delta Upsilon chapter occupies the south division of Chaplin Hall, which has been remodeled and improved for social purposes. According to the President's report of 1908, "the chapter house movement has greatly simplified the work of college education and improved the life of the students in every direction."

Grounds, buildings, and equipment are

## COLD SPOTS

valued (1908) at \$362,515.51. The total income is about \$57,000. The average salary of a professor is \$1600. There are (1909) 17 members on the instructing staff, of whom 9 are full professors. The students number 283, of whom 133 are women. Arthur Jeremiah Roberts is president. C. G.

**COLD SPOTS.**—In 1884 Blix, Goldscheider, and Donaldson independently discovered that the sensations of cold did not originate at all points of the skin, but were restricted to certain limited areas that they called cold spots. These spots are the locus of the endings of certain differentiated nerve fibers that respond to low temperatures and other stimuli with the peculiar quality *cold*. Temperatures below 34°C and above 45°C stimulate the cold spots. The stimulation by the lower temperatures is recognized for itself. The effect of the higher temperature combines with the excitation of the warm spots to give the sensation hot. Von Frey conjectures that the sense organ of cold is the end bulb of Krause, on the basis of the fact that both the end bulb and sensitivity to both are found in the cornea where warm sensations and pressure sensations are lacking. W. B. P.

**COLDS.**—The word "colds" is a generic term used loosely for any acute catarrhal inflammation of the mucous membrane of the upper air passages. In many parts of this country, as every teacher knows, the prevalence of colds is a serious handicap to school work, not only by causing many absences, but by making it difficult for children suffering from them to do their school work and also by the disturbance of class exercises by frequent coughing. Although the specific cause of the disorder is obscure, it seems to be caused by germs. It is reported by travelers that in the pure air of high mountains, in mid-ocean, and in the arctic regions colds are practically unknown.

While the disorder seems to be a germ disease, the contributing causes are perhaps many, especially anything which causes depression, extreme fatigue, indigestion, a chill, overheating, too thick clothing, lack of cleanliness, and lack of fresh air. The conditions in the schoolroom that cause colds, apart from possible direct infection, are apparently the dust of the schoolroom, the frequent overheating, and the extreme dryness of the air in many schools. The last-mentioned condition, at least, seems to be a frequent cause of sore throats and the like.

Pupils suffering from colds should be carefully watched, and wherever the services of a medical inspector are available the case should be reported. Frequently what seems to be a cold is a premonitory symptom of measles or some other disease. W. H. B.

**COLET, JOHN.**—Refounder of St. Paul's School, London, Dean of St. Paul's (1465-1519). Colet has no real claim to the position, first assigned to him by his eighteenth-century biographer, Knight, of the inauguration of a new era of education and of a new system of schools or schools on a new system. In his reconstruction of St. Paul's School he merely followed, and did not set a fashion.

John Colet was the eldest son of Sir Henry Colet, mercer, Lord Mayor of London in 1486 and again in 1496, and Christian Knyvet, a highly connected lady of Norfolk. The school, if any, and college, in which he received his education, are unknown. The probability is that, being the only one of twenty-two children who survived infancy, he was privately educated at home. Before he was twenty, he was benefited by his mother's family with Dennington rectory, Suffolk, in 1485, by his father with Thurning, Huntingdon, in 1490, which he resigned in 1494, probably on being appointed, also by his father, to Stepney near London. He was given a canonry at York in the same year, and was also a canon of St. Martin's-le-Grand, Salisbury, and Chichester, before he was ordained deacon, so that it is a little strange to find him in a sermon to Convocation in 1512, when he had added to these a prebend and the Deanery of St. Paul's, denouncing those who care not how many benefices they take "so that they be of grette value." Young Colet, like others, used his benefices as exhibitions to the University, for the first ascertained fact about his education is that from about 1493 to 1496 he was at Orleans and Paris Universities and visited Italy, and studied theology and law. He was ordained deacon in December, 1497, and priest Mar. 23, 1498, while he was delivering a course of theological lectures, chiefly on St. Paul's Epistles, 1496-1499, at Oxford. Here he met Erasmus, who, being a regular or Augustinian canon, was studying at the college of the order at Oxford, called St. Mary's. He was made Dean of St. Paul's in 1504 or 1505. He began his reconstitution of St. Paul's School by building "a scolehouse of stone" for 153 children at the East End of St. Paul's Churehyard, a few yards northward of the old school, placed there about 1111, and finished it in 1510, and then began a master's house adjoining it. He obtained the royal license in mortmain June 6, 1510, and on July 27, he himself as Dean and with the Chapter granted William Lily, of Magdalen College, Oxford, then appointed master of the new school, all the privileges of the master of the old school,

including a stall in the choir, and "took him into their bosom." On Mar. 28, 1511, he got the Chapter to join him in conveying the new school and the old school, and the Chancellor of St. Paul's to release all his rights over the old school, to the Mercers' Company, of which Colet was a member, as trustees and governors. He also asked the Pope for a transfer of all the rights and privileges of the old to the new school. He gave his whole patrimony, lands worth £53. 6s. 8d. a year, as endowment, afterwards increased to £122. 4s. 8d., of which £5 a year represented the old school endowment. On June 17, 1512, he made statutes for the school, but they are not extant, being superseded by a new edition on June 18, 1518. The steps of this foundation have been particularized because the school has hitherto been represented as an entirely new foundation, with no connection with the old school, which has been represented as in abeyance, whereas Colet was careful to place the new school exactly in the position of the old, except that the Mercers were substituted for the Dean and Chapter and Chancellor of St. Paul's as governors. This entirely destroys the theory that the school itself was a new departure. Nor was it, as has been represented, a new departure to make a lay body of governors. Half a dozen Lord Mayors of London, from Sir Edmund Shaw, goldsmith, in 1487, who founded a grammar school at his native place of Stockport in Cheshire, had already made their companies governors of grammar schools founded by them, and William Abbott, a mercer, had made Colet's own company of mercers governors of his school at Farthinghoe in Northamptonshire in 1443. The curriculum laid down by Colet was not that of an advanced humanist insisting on the classics, but of a reactionary, prescribing not Vergil or Cicero, but authors such as Sedulius and Juvenius, who turned the Bible into Latin verse in the fourth to the sixth centuries, and were studied at York in Alcuin's day. The only innovation was the mention in the Statutes, in a rather casual and subsidiary way, of Greek. There is evidence that Greek had been already taught at Winchester and Eton, and it was not the study of the Greek classics so much as of the Greek Testament and the Fathers which Colet had in view. The only novelty about the refounded school lay in its being the largest Free Grammar School, free from tuition fees for all its 153 day scholars, which had yet been founded, while its masters enjoyed the largest salaries yet paid, 52 marks (£34. 13s. 4d., as against £16 at St. Anthony's for the High Master), and £17. 6s. 8d. for the Usher or "Surmaster" (as against £5. 13s. 4d. at Eton and Winchester). But the masters in these other schools had their board and lodging, and fees from Commoners or Oppidans as well.

For a century and a half after its foundation St. Paul's took a high place among English schools. After a century of decay from 1720

to 1865, it was restored by the Endowed Schools Commissioners, being taken out of the exclusive government of the Mercers and removed to a new site and buildings in Hammersmith in 1876, and is now the largest and most successful of the schools of London.

Colet was a reformer in matters religious, and is said to have been near prosecution for heresy. His will significantly makes no gifts to religious houses or for masses for his soul, though he had added a chantry to the school in 1513 to pray for his own and the King's soul. He died Sept. 16, 1519, and was buried in St. Paul's, but his monument perished in the Fire of London. A. F. L.

**COLGATE UNIVERSITY, HAMILTON, N. Y.**—Founded in 1818, by the Baptist Education Society, for the education of ministers. The college and preparatory departments were incorporated in 1846. In 1890 the institution, which has been brought into a flourishing condition under the presidency of Ebenezer Dodge, adopted the name of Colgate University in honor of the Colgate family, which had assisted it materially with money and a library. In 1893 Hamilton Theological Seminary became a part of the university. The grounds of the university cover an area of about two hundred and twenty-five acres, of which about one hundred and twenty-five are included in the campus. The equipment consists of seven buildings, used as lecture rooms, laboratories, library, and dormitories. The admission requirements are equivalent to 14 or 15 units, and may be satisfied by examination at the university or under the regulations of the College Entrance Examination Board. Certificates from approved preparatory schools are accepted in lieu of the examinations. The Bachelor's degrees are offered in two courses—arts and letters and science, in each of which a major and two minors must be presented; graduate courses leading to the Master's degrees or the degree of Bachelor of Divinity are also maintained. In 1909, the university had an enrollment of 330 students, including three who were doing graduate work. The faculty consists of 24 professors, 5 associate, and 1 assistant professor, and 3 assistants. Elmer Burritt Bryan, LL.D., is the president.

**COLLECTING INSTINCTS.**—There is a disposition on the part of certain of the lower animals, such as crows and ravens, to pick up bright objects which attract their attention and

to store such objects away, although they do not make any direct contribution to the animal's personal comfort or welfare. This tendency on the part of animals has been described as a natural instinct for collecting objects. Young children exhibit a very strong tendency to acquire and retain objects of which they can make no particular use. This tendency on the part of children has been described as an instinct, and has been compared with the behavior of the animals above referred to. The tendency of older children to become absorbed in the collecting of certain particular kinds of objects, such as stamps or coins or natural history specimens, has been widely discussed as an outgrowth of the more primitive instincts of animals and younger children. Attention has been drawn to the fact that these tendencies of children can be taken advantage of for educational purposes. It is, however, a misnomer to refer to this collecting tendency as an instinct. The natural impulse to make such collections does undoubtedly exist, and its advantages for educational purposes should not be underestimated, but it is a complicated expression of the whole self-asserting tendency of the individual rather than a specific instinct.

See ADOLESCENCE; INSTINCT.

**COLLECTIVE CONSCIOUSNESS.** — There are certain common beliefs and modes of thought which grow up in any community of intelligent beings. These common types of consciousness can be considered for scientific purposes as if they stood apart from any single personality. The community as a whole produces this collective or social consciousness, and is in turn controlled by it.

See CUSTOM; SOCIAL PSYCHOLOGY; TRADITION.

**References: —**

- MACDOUGAL, W. *Social Psychology*. (London, 1908.)  
 ROSS, E. A. *Social Psychology*. (New York, 1908.)

**COLLECTIVE WILL.** — This term, like collective consciousness, refers to a social phenomenon. Tendencies toward certain types of action grow up and are fostered in community life in such a way as to become characteristic of the whole social group.

**COLLEGE.** — One of the many terms for a society or body of persons associated together for promotion of a common purpose which, originally general and applicable to any such body, has become restricted to a particular kind of body; viz. one for the promotion of secondary or higher education. The word "college" comes from Roman through Canon

law. Cicero speaks of the College of Augurs and of high priests (*pontificum*), of the colleges of praetors and of tribunes. Livy mentions the college of merchants in 493 B.C., while Horace, in a famous line in his Satires (I, ii, 1) speaks, partly by a sort of metaphor, partly by a sort of jest, of the colleges of ballet girls. Under the Empire the term became identical in meaning with the medieval guild. The law put restrictions on the functions of these associations, and license was needed for them as it was in medieval times. Pliny tells us (*Paneg.* 54) how he was consulted, as governor of his native town, as to the establishment of a guild of smiths (*de instituendo collegio fabrorum*). When he was governor of Bithynia, he forwarded a petition to the Emperor Trajan for the foundation at Nicomedia of a college of working carpenters to act as a fire brigade, but as it was to consist of 150 members, the petition was refused (*Plin. Epist.* X, 43), because of the disturbances already created by such colleges "which, whatever purpose they pretended, became political agitators." Many of the colleges which appear in the later Roman inscriptions all over the Empire were, like the medieval religious guilds, chiefly burial and benefit clubs. By a strange chance, the guild halls of these colleges came to be called schools (*scholæ*), a name no doubt derived from the educational guilds, such as Plato's Academy, which were endowed colleges. These *scholæ* consisted of an oblong hall with a semicircular apse at the end, round which were placed the seats of the president and officers of the guild, while in front of them was the altar on which offerings to or for the dead were made and the table at which they ate their common meals, while a chapel was often attached, in which general meetings and elections of officers were held. A record of such an election at Reggio is dated "in the chapel of the college of smiths and patch-work makers" (*in collegio fabrorum et centonariorum*, Inscr. Orell. 4133). The general meeting of the College of Actors called itself the *sancta synodus*, and the "holy synod" governed the medieval and still governs the Russo-Greek Church. Many of these guilds were known by the names of their patron god, and Jupiter College and Diana College anticipated and indirectly originated the Jesus Colleges and St. Mary Colleges of Oxford and Cambridge.

Professor Baldwin Brown of Edinburgh, in his *From Schola to Cathedral* (1884), suggested that the earliest type of Christian church with nave and apse was derived from the *scholæ* of the *collegia*, and Rossi's researches in the Roman catacombs confirmed and demonstrated the truth of the suggestion. Probably the medieval practice of dubbing the Jewish synagogues *scolæ* is derived from a similar analogy, if not from direct practice. As the buildings, so the constitution of the Christian churches is derived from the *collegia*. The bishop and

his college of clerks, even in the days of St. Jerome, were, like the members of the *collegia*, in regard to their corporate property, supposed to have all things in common, especially their meals. But the growth of episcopal power converted an oligarchy into an absolute monarchy, a college of equals, having all things in common, into a bishop, as absolute owner, dispensing to his court of clerks what he thought fit (*Decretal* ii, c. 24, cxii, qu. 1). At the end of the fifth century (*ibid.*, c. 26-30) the property of each church was divided into four parts, of which the bishop took one, his clerks a second, the fabric a third, and the fourth was to be given to the poor, and this rule was also laid down by Gregory the Great to Augustine of Canterbury at the foundation of the English church in 601. But the bishop was elected by the clergy, and he could not alienate any church property without their consent. By the eleventh century the clergy of Rome had become recognized as the council and electors of the Pope, and the College of Cardinals and the clerks, now called canons of the Cathedral Churches, had become a council with possessions separate from those of their bishop. The corporate existence was recognized, but under the name of the canons or the chapter (*capitulum*) of canons, not college. The early collegiate churches, which were not actually bishops' sees, though often, as in the case of Ripon in Yorkshire and Crediton in Devonshire, they had been bishops' sees, used the same term of chapter for their corporate title, and grants made to them were made simply to the church and the canons serving it. It was probably owing to the revival of the Roman, or, as it was called, the civil, in distinction from the canon law, that the term "college" reappeared. One of the earliest, if not the earliest, uses of it is in a constitution of the Lateran Council (c. 42, 16) of 1215, by which it is ordered that in the selection of a bishop by the chapter, "three of the college" (*de collegio*) are to be appointed to take the votes. The canons of Treves are called a *collegium* in the headnote to a letter of Innocent III about the same date, but as an alternative headnote speaks of the "chapter," it is not certain that the first headnote is contemporary with the letter. In England, in the middle of the thirteenth century, when the mania for monks and monasteries, including the so-called regular canons, and the friars had died down, and a revulsion in favor of the secular clerks, the ordinary clergy, had taken place, largely owing to the growth of the universities, colleges or collegiate churches began to be founded all over the country. During the monastic predominance, the clerks had been turned out of many cathedrals and ancient collegiate churches, mostly of pre-Conquest date, which had been founded on the model of the cathedrals, like Bedford and St. Frideswide's at Oxford, and which consisted, like the cathedrals, of bodies of secular canons, presided over by a

dean or provost, with a schoolmaster as their first or second chief officer. From 1250 onwards to the Reformation there was an extension and revival of such of these old collegiate churches as had survived, and a constant erection of new ones. The essential feature of these new creations was the endowment of a body of priests to live together in one community, the older ones in separate houses gathered in a square round the common center, the church, the later ones generally in a common house. . . . Sometimes, as at Howden in Yorkshire in 1266, a rich rectory, worth, say, £60 a year, equivalent to £2400 a year of modern English money, was cut up into half a dozen "prebends," given to as many priests, who were bound to be resident and do the services. More often a parish church, situate in the place, from which some successful prelate had sprung, was taken and made the seat of a college of priests, a number of neighboring parish churches being bought and their revenues appropriated to the college, while the appropriated churches were served, either by the members of the college going out to them to do the services, or, when they were too distant, by perpetual curates or vicars who were given the lesser tithes for their living, while the great tithes and landed property were taken by the members of the college. It is in connection with these new foundations that in England the term "college" is first found.

The earliest instance forthcoming is in the foundation deed, Mar. 26, 1267, of the collegiate church (*collegiatam ecclesiam*) of St. Thomas the Martyr at Glasney, now part of the town of Penryn in Cornwall, by Bishop Bronescomb of Exeter (*Exeter Ep. Reg. Bronescomb*, ed. Hingston-Randolph, 1889, p. 44). He says he finds it for the spread of divine worship and the increase of the beauty and splendor of the house of God and gives to it the parish church of Penryn which was very poor and the revenues of the church of St. Budock (in which parish the church stood) which had long been divided into portions, being no doubt an ancient collegiate church, and a neighboring parish church of St. Feock for the food and maintenance of the clerks serving there forever. They are to be thirteen in number, the most usual number of such establishments, after "Christ and his apostles twelve," and are especially directed to be called secular canons, and to be governed by the same customs and enjoy the like liberties as those of Exeter Cathedral with thirteen vicars to serve under them in the choir. One of the number was to be "the Proctor of the corporate body" (*procurator collegii*) until a captain or warden could be formally endowed. By a further deed of Sept. 1, 1270, four more parish churches were annexed to the collegiate church, and in 1272 there is a provost as head, and the bishop informs us that the buildings and mansions of the canons had been erected

of sumptuous work, and the bare land had been turned into gardens and orchards by them, in return for which the obits, or the anniversaries of the deaths of these first canons, were to be celebrated forever and 8s. spent on those canons, vicars, and clerks attending each. His successor, Bishop Peter Quinel, in 1283 annexed the ancient prebendal church of St. Probus and gave its prebends to the Provostry.

In that year, 1283, two similar colleges were founded: one in Wales by the bishop of St. David's, who "considering what health and solidity arises from the unanimous and united company of an established college," made the church of Llangadock collegiate (*collegiatam facimus*) for 21 secular canons and as many vicars; and the other in the county of Durham by Anthony Bek, Bishop of Durham, who made the church of Lanchester collegiate with a dean and seven prebendaries. The same prelate founded the collegiate church of Chester-le-Street in 1286, and refounded and enlarged that of St. Andrew Auckland in 1292. In 1300 the term "collegiate church" is for the first time applied to Southwell Minster, the Archbishop of York's Nottinghamshire quasi-cathedral, which had existed since at least the year 800; and in 1304 the term is used of the same archbishop's East Riding of Yorkshire quasi-cathedral for the canons of St. John of Beverley, founded by King Athelstan about the year 900. Thenceforward the term became the technical term for all such churches. In all of these, as in the cathedrals, a grammar school and a song school, and in the older and larger ones a theology school, were essential and important features. It is a curious thing that though the movement in favor of colleges of secular clerks was no less pronounced at the universities than elsewhere, if it did not originate there, yet none of the earlier university colleges are so called.

The earliest university colleges were at Paris University. The universities originally consisted of casual assemblies of clerks who lived in hired houses in the towns, singly or in groups as they chose. The collegiate foundation gathered them together and provided free lodging and free living. The earliest at Paris, in later days called the College of Eighteen (*Collège de Dix-huit*), was oddly enough founded by an Englishman. Joyce or Joicey (Jocius) of London, returning from a pilgrimage to Jerusalem was much struck with the arrangement by which the Hospital of St. Mary at Paris by an ancient custom founded a chamber for poor clerks to live in. The Chancellor of Notre Dame, who was the chancellor and presiding genius of the university, was proctor or governor of this hospital. With his assistance Joyce bought the room for £52 on condition that the hospital governor should always maintain eighteen beds sufficient for so many scholars-clerks (*scolaribus clericis*) and give them 12s. (*nummos*) a month

each for maintenance, in return for which the scholars-clerks were to carry the cross and holy water before the bodies of the sick who died in the hospital and sing every night the Seven Penitential Psalms. The deed of Dean Goldenbeard (Barbedaurus) and the chapter of Paris confirming this arrangement was made in 1180 (Denifle, *Chart. Univ. Paris*). The example set by Joyce of London was followed at the Hospital of St. Thomas the Martyr (Becket), also a Londoner, near the Louvre, by Robert, Count of Dreux, in 1186, he providing a separate building in the hospital known as the "House of the Poor Scholars of the Louvre." In 1209 Peter of Nemours, Bishop of Paris, in what was afterwards known as the College of St. Honoré, founded beds for thirteen poor scholars, under the wardenship of a canon of St. Honoré. This too was only called the House of the Poor Scholars of St. Honoré. Similarly, the St. Nicholas Louvre College in 1247, the Oriental College founded by direction of Pope Innocent IV, in 1248, the great College of the Sorbonne, which ultimately swallowed up the University itself, founded by Roberts of Sorbonne, canon of Paris, in 1257, the Treasurers College, founded by a treasurer of Rouen Cathedral in 1266, and the College of Navarre, founded by the Queen of Navarre and France in 1304, were all called, not colleges, but houses of Poor Scholars.

In England the earliest known provision of the same sort was also in about the year 1180, when Simon of Farlington, in Hampshire, Archdeacon of Durham, probably imitating St. Cross Hospital, Winchester, gave the Almoner of Durham Cathedral Monastery a manor which he had bought to maintain three scholars of Durham School sent to dine and sleep in the Almonry Hospital by the Schoolmaster. But this was not for scholars of university standing. The earliest English university college was that of St. Nicholas at Salisbury, founded in 1262 by Giles of Bridport, Bishop of Salisbury, where there was a university since 1209, for 2 chaplains and 20 poor, honest, and teachable scholars in a house by St. Nicholas' Hospital, under the wardenship of a canon of the cathedral. This was called the House of the Valley Scholars of St. Nicholas. So the first College of Oxford University founded in 1264 for 20 scholars living "at Oxford or wherever else a university may chance to flourish," to be maintained by two or three chaplains managing estates and living at Maldon in Surrey and teaching 13 founder's kin grammar there, was named "the house of the scholars of Merton," after Walter Merton, Lord Chancellor of England, its founder. In 1269 Bishop Walter de la Wyle founded a theological college at Salisbury for 13 priests to study theology there under a provost, called St. Edmund's house. In 1270 Merton moved his House of Scholars from Maldon to Oxford, and in 1274 gave them a code of statutes, the model

of all future college statutes. But the word "college" does not appear, though it was in all respects like a collegiate church, the Church of St. John the Baptist being appropriated to it, as the Church of St. Edmund was to St. Edmund's College at Salisbury, the warden and scholars sitting in the choir and holding precisely the same position in regard to it as the Dean and canons did in an ordinary collegiate church. At Cambridge the first college was originally founded on Dec. 24, 1280, in almost exact imitation, conscious or unconscious, of Joyce at Paris, by Bishop Balsham of Ely, placing some poor scholars in the Hospital of St. John at Cambridge (now St. John's College). But finding that the regular canons, who managed the Hospital, quarreled with them, on May 28, 1285, he moved the scholars outside the town by St. Peter's Church, which he appropriated to them. The name the founder gave the college was the House of the Scholars of the Bishops of Ely, and they were directed to follow the rule of the House of Scholars of Merton at Oxford. It took its popular name, by which it is still known, of Peter-House from the church which has changed its name for that of St. Mary-the-Less. It is not till friar John Peckham, Archbishop of Canterbury, as visitor, made ordinances for Merton in 1284, in which he speaks of Walter of Merton as "planter and founder of your college" that the word "college" is used for any educational collegiate establishment.

Forty years later, King Edward II, on Apr. 26, 1324, granted license to his almoner, Adam of Brom, to found "a college of scholars studying in divers sciences, in honor of the Virgin" to be governed by a "rector." The king in 1326 approved statutes to be observed "in the college of the scholars of the house of the Blessed Virgin of Oxford," and the founder himself called it "the college of scholars of the House or Hall of the Blessed Mary," the Church of St. Mary, now called the University Church, being appropriated to it. The popular name by which it is still known, Oriel College, came from some feature of the building. The next college, now Exeter College, was called in the royal license to Bishop Stapledon of Exeter, its founder, a collegiate hall (*aulam collegialem*) and named Stapledon Hall. It was the first college to which no church was appropriated, having instead its own chapel within its walls, chiefly because the church of the parish in which it stood, St. Peter's in the East, was already appropriated to Merton. At Cambridge the term "college" was first used in the license to Edmund Gonville in 1348 to establish "a college of twenty scholars and to give a name to it," and he gave it the name of "the house or hall of the annunciation of the Blessed Virgin, in English 'Gonville Hall.'" It was not till a generation later that the term "college" was transferred from the society of scholars to the place they lived in. License was granted to

William of Wykeham, Bishop of Winchester and ex-Lord Chancellor, in 1379 to grant certain property he had bought in Oxford to found "a certain college, house, or hall, and give it a name, for a Warden and seventy scholars studying in divers faculties in the University of Oxford." The name given was "in the vulgar tongue, 'Seinte Marie College of Wynchestre in Oxenford,'" but a hurrying people called it, and continue to call it, New College, Oxford. In this college the domestic chapel was for the first time made the largest and most important part of the building, exceeding the dimensions of many parish churches. This foundation deed of New College is the first example of the word "college" in English, a year earlier than that given by the New English dictionary in a quotation from Wycliffe, referring to Christ and his college of apostles. Three years later, William of Wykeham gave legal permanence to the school he had been maintaining, since 1373 certainly and probably since 1369, at Winchester, by incorporating it, too, as a college under the name of "Seinte Marie College of Wynchestre" to consist of a warden and 70 scholars-clerks (*custos et scolares clericis*), the identical term used by Joyce of London at Paris in 1180. Only the scholars in this case were not of mature age studying in the higher faculties, but boys of 7 to 18 years of age learning grammar. This college was placed under the guardianship of the College of Oxford, to which it was to serve as a feeder, and from which it was exclusively recruited. When the present college was finished in 1394, the founder made it more like an ordinary collegiate church by adding 10 priest fellows to say masses for his soul, but though with the warden they formed the governing body of the college, they never became a part of the actual corporate body, which always remained "the warden and scholars-clerks." This was a new departure of great importance in the history of education, especially as with the 70 "poor and indigent" scholars—whose poverty was a very relative term, as it comprised sons of judges and masters in chancery and sheriffs and other country gentlemen—were associated 10 gentlemen's sons (*fili nobilitum*) as boarders (*commensales*) with them paying for their board. They came to be known as Commoners. In addition any boys who chose to come—and they came to the number of 80 or 100—were admitted to the school, though living, like the university scholars, in the city at home or in lodgings, but these last were not recognized as part of the foundation. The foundation deeds of two much smaller foundations of the same time are preserved, one the House of Scholars or Schoolhouse (*Domus scholarium* or *Domus scholarum*) of Wotton-under-Edge in Gloucestershire, founded by Lady Katharine Berkeley (*q.v.*) in 1384, the other the College of Bredgar in Kent, founded by subscription in 1397. Each

of these was for a master in grammar, who was to act as chantry priest, and teach a grammar school, and two boys who were to act as pupil teachers under him, and he and they were directed to live college-wise (*collegialiter*) together. It is probable that these foundations had their models abroad, as in a mighty encyclopedia of Canon Law (Brit. Mus. MS. Reg., 6, E, 7) by one James, written about 1350, under the term "Collegium," to the question "Who can form a college?" the answer is, "Say the men of any profession, such as grammar teachers (*grammatici*) or of any occupation, as bakers and the like." It looks therefore as if collegiate schools were already known before Wykeham's foundation. But if known to him, they are not known to us.

Wykeham's example was speedily imitated. Henry Chicheley, an eminent canon lawyer, one of the earliest scholars of Winchester College and of New College, who became Archbishop of Canterbury, founded in 1425 a college at his native place, Higham Ferrers in Northamptonshire, in which he collegiate the parish churches, attached to it the preëxisting almshouse of thirteen poor men and the grammar school, and made the grammar school-master one of the fellows. He did not, however, unfortunately for it, attach this college to his College of All Souls, which he founded at Oxford in 1437, and so it perished. In 1440 King Henry VI followed the example of his godfather, Chicheley, and began to establish, not at his native Windsor, which already possessed the ancient College of St. George's, but at Eton near it, a college school, collegiate the parish Church of St. Mary, establishing a College of St. Mary of Eton by Windsor to consist of a provost and 25 scholars-clerks, studying grammar, an almshouse of 25 old men, and a free grammar school. At the same time he founded St. Nicholas' College at Cambridge for a rector and 12 scholars in the higher faculties. In 1445 under the influence of his secretary Beekington, another of the early scholars of Winchester, and Waynflete, its headmaster, whom he transported to Eton and made Provost there, he refounded his colleges, increasing them to the same number as Wykeham's 70 scholars in each, with 20 "noble" commoners, and any number of oppidans who wished to attend the Free Grammar School. It is curious that he did not take the step forward, as Chicheley had done, of making the master a member of the college. His failure to do so made Eton like Winchester, both the creators of the English public school system, a system of boarding schools for the upper classes at high rates. For the pay of the master, £10 a year, being fixed by statute, necessitated his looking to fees, instead of to a rise in salary, for his reward, when the value of money fell, and made the Free Grammar School of Eton, supposed to be free of tuition fees, the most expensive and aristocratic in the

kingdom. The colleges of Alcester, near York, founded by Bishop Stillington, Lord Chancellor and Bishop of Bath and Wells, c. 1464, and of Jesus of Rotherham in Yorkshire, founded by one of the first King's College scholars, Thomas Rotherham, Lord Chancellor and Archbishop of York, in 1480, did take this step. But these colleges consisted of a provost to manage the property and preach, and three fellows, who were respectively to teach free schools of grammar, song, and writing, the last including arithmetic and "all scribes' craft." In 1487 William of Waynflete, the ex-headmaster of Winchester and ex-provost of Eton, afterwards Lord Chancellor and Bishop of Winchester, founded Magdalen College at Oxford, and attached to it a grammar school, and particularly ordered that the boys should not be taken from grammar and put on to become soplusters, *i.e.* to study philosophy and logic, until they had become thoroughly proficient in their classical authors. He also attached to it a grammar school at his native place of Wainfleet in Lincolnshire but did not make the boys there an integral part of his college. Forty years later, the greatest of all educational college founders arose in Thomas Wolsey, Lord Chancellor and at the same time Archbishop of York and Bishop of Durham and cardinal. "The whirligig of time bringing about its revenges," he reversed the proceedings of the twelfth century and suppressed monasteries wholesale for his two colleges, turning St. Frideswide's Priory into Cardinal College at Oxford, and St. Peter's and other monasteries into Cardinal College at Ipswich, the one for 100 fellows, the other for a warden and 50 boys. But on his fall, these great foundations ceased when they had hardly begun to be. The one, however, refounded by Henry VIII, became Christ Church, Oxford, partly a cathedral, partly a college, which affects *par excellence* the older title of "the House." A small fragment of the Ipswich endowment was bestowed on the grammar school, which had existed long before Wolsey and flourishes still.

Though the educational colleges were some of the most important, they were by no means the most numerous of the colleges founded between 1250 and 1535. Not only were collegiate churches of the ordinary type, in which church services came first and education only incidentally, being founded all over the country through the whole period, but the subordinate bodies of clerics attached to the cathedrals were incorporated in colleges also. The Vicars Choral, or choir deputies of the canons at York and Hereford, at Lincoln and Southwell and elsewhere, were incorporated; the chantry priests, the priests endowed to sing for single people's souls, as at York and Southwell minsters, and even at large parish churches like Hull and Boston, received common endowments and were incorporated as a body;

the choristers also were sometimes constituted a separate college with separate estates. Not less than two hundred of these colleges, besides University and School Colleges, existed in 1545. But with the educational colleges as well as the guilds and brotherhoods, which reproduced the Roman *collegia*, they were all swept into the act for the abolition of all such corporations, commonly called the Chantry Act, of 1545, which empowered Henry VIII to confiscate them all to pay for his wars with France and Scotland. This act was for Henry's life, and he died before he had confiscated more than a dozen colleges. A new Chantry Act was passed in the second year of Edward VI, 1548. From this the colleges of the universities and the three collegiate schools attached to them with the cathedrals were exempted. All the rest were absolutely abolished. Even new colleges, such as Thornton in Lincolnshire, which, when the monasteries had been abolished between 1535 and 1540, had been converted into colleges by Henry VIII himself, though education had been given in them a place almost as important as in the university colleges, were now dissolved. In the new cathedrals, into which some of the old cathedral monasteries and greater abbeys were converted, the schools were made an integral part of the new college, and the name of "college" at Gloucester, Bristol, Worcester and elsewhere superseded that of "abbey" and "priory" and has left its memory in College Streets and College Greens. But with these exceptions, and that of the College of Surgeons, all the colleges, which survived the year 1548, 13 at Oxford, 14 at Cambridge, with Winchester, considered part of Oxford, and Eton, part of Cambridge, were educational. Hence the term "college" came to be regarded as meaning exclusively an educational establishment.

The foundation of colleges did not cease at the Reformation. But thenceforward colleges were, with the single exception of Westminster Collegiate Church, which maintained what for three centuries was the chief school of London, and for a century the chief school in England, solely educational. Edward VI designed great law colleges at Oxford and Cambridge which never came into existence. Private benefactors were more successful. At Oxford Sir Thomas Pope created Trinity College in 1554 in what had been Durham College, the Oxford College for eight student monks from Durham. Sir Thomas White, a successful merchant tailor, founded St. John's College in 1555 in the deserted college of the Cistercians. After several futile attempts, Gloucester College, the college of the southern Benedictine monks at Oxford, which had sunk into an unendowed hall, reappeared as Worcester College in 1714. Wadham College was founded in 1612, a belated imitation of the old colleges, by Nicholas Wadham and his wife; while Broadgates Hall, an ancient house of scholars, blossomed into

Pembroke College in 1624, through the efforts of the Municipal Corporation of Abingdon, solicitous to find a place of higher education for the scholars of Abingdon Grammar School.

At Cambridge the Puritan Chancellor of the Exchequer, who had first obtained preferment as chancellor of the court created to deal with the confiscated monasteries and colleges, Sir Walter Mildmay, founded Emmanuel College in 1584; and Sidney Sussex College was founded by Lady Sidney, Countess of Sussex, in 1596. A successful strolling player and actor-manager, Edward Alleyn (*q.v.*), founded a rather pinchbeck imitation of Winchester and Eton colleges at Dulwich, near London, called the "Colledge of God's Gift," in 1619 for a master, warden, and 4 fellows, of whom one was preacher, the second schoolmaster, the third usher of the school, and the fourth organist or Song Schoolmaster, with 12 poor scholars. But as the founder married a young wife before he had fully endowed the college, the foundation lingered in a semi-moribund condition for three centuries, until the growth of London made it blossom into one of the wealthiest of school foundations in the second half of the nineteenth century. Oliver Cromwell, Lord Protector of the Commonwealth of England, founded, out of the revenues of the disestablished Dean and Chapter, a University College at Durham (*q.v.*) by letters patent of May 15, 1657. An ordinance giving it power to grant degrees as a university was drafted in 1659. But the Restoration came before it was passed, and in 1660 the college ceased to be, and the Chapter was restored.

No other college seems to have been founded in England for a period of nearly two centuries from the reign of James I to the year 1800. Then a contingent bequest in default of heirs, made nearly a century before, of the man from whom Downing Street takes its name, was made effective by the Court of Chancery in the creation of Downing College, at Cambridge. It was nearly half a century more before a new crop of colleges began to arise, not as university colleges, but school colleges. These purported to be after the fashion of Winchester and Eton, but for the most part bore no resemblance to them except in name and the fact that they were secondary schools catering for the richer classes. The first of them was Cheltenham College, which had none of the characteristics of a college. It was not in any sense a corporation; it had no corporate property and its members were not coöperative. It was merely a private adventure school run by a number of the old Anglo-Indian civil servants and military men who flocked to Cheltenham for its waters and its cheapness. They combined in 1840 to hire land and buildings and a headmaster. This school catered at first entirely, as it still does largely, for day boys. But it was run on "public school lines" and was successful. In 1894, by being incorporated by Act of

Parliament, it became an endowed school with an incorporated governing body, and so, to that extent, a college in the proper sense. Marlborough College, started in 1843, was of the same kind, except that the people who subscribed to it were drawn from all over England and consisted chiefly of clergy and clerically-minded laymen, largely lawyers, instead of military men. It aimed at being a cheap Rugby, a boarding school for a lower middle class. St. Peter's College, Radley, in Berkshire, some five miles from Oxford, was a real school college, founded with a deed and a code of statutes by William Sewell, a Wykehamist himself, on the model of Wykeham's foundation, as modified by Rotherham, the warden being the headmaster and the assistant masters the fellows, who lived and acted together as a body corporate, though permanent endowment and legal incorporation did not come till 1861. St. Andrew's College, Bradfield, near Reading, was founded in 1850 on a similar model, with the founder as warden and the masters his appointees; but it did not obtain a royal charter and incorporation till 1862. Wellington College, also in Berkshire, founded by subscription in honor of the Duke of Wellington in 1859, like Clifton College in 1860, Malvern College in 1862, and Haileyburg College in 1864, all ranking among the "Great Public Schools" of England, followed in quick succession. Since then so-called colleges, which are merely schools and often merely private schools, such as Brighton and Eastbourne colleges, have been and are being founded in every year that passes. In 1870 Keble, and in 1874 Hertford Colleges were founded at Oxford, and in 1882 Selwyn College at Cambridge, but this is not recognized as a college of the university.

At the same time so-called colleges, not of the school but of the university type, have been founded all over the country, beginning with University College and King's College, London, in 1828; Owens College at Manchester, now the University of Manchester, in 1851; Mason's College in Birmingham in 1870, now a college of Birmingham University, founded in 1900, and many more. The term has been extended and made common in the so-called Training College for Elementary School Teachers, built by government aid broadcast. Now any private individual sets up a private adventure school, here to-day and gone to-morrow, and any town or county council sets up a technical school, paid for out of the rates, and dubs it a college, so that the term threatens to become a pretentious name for a secondary school, with a secondary connotation of a place of "university" or technical education for those over 16 years of age. A. F. L.

**COLLEGE, THE AMERICAN. — GENERAL INTRODUCTION.** — The origin of the American

college as the one distinctively American educational type and the complex problems that confront that institution to-day cannot be understood apart from their historical setting. With the Renaissance in Europe in the eleventh century came the university, with its four departments, the arts course and the professional schools of law, medicine, and theology. The arts course, of which the American college is the lineal descendant, was everywhere regarded as preparatory to professional studies. Its purpose was to lay a broad and general foundation for the specialized studies of the higher faculties. Not long after the close of the Middle Ages, a modification of the arts course began which has continued to the present day. The elementary studies were gradually crowded down into the programs of preparatory institutions, and more advanced studies took their places. The trivium, — grammar, rhetoric, and dialectic, — which at first led to the A.B. degree, was little by little relegated to a new type of school which developed to prepare students for the arts course. But even after the Renaissance and the Reformation had thus affected the trivium, the arts course retained its distinct relationship to the professional schools. The Renaissance, with the ideal of culture for its own sake, left a lasting humanistic impression on the old arts course. The wider vision of the new learning regarded the college course no longer as a mere preparation for the study of three traditional professions, but rather as a liberal training leading directly to effective participation in scores of new activities.

With the Reformation in Germany came changes which led to a new type of university and eventually to a school system with no intermediate institution parallel to the early arts course. In time the college with its dormitory system and secluded life disappeared, and in the commercial towns of Germany the modern type of university developed. At the same time several new types of preparatory schools were founded which gradually developed into the modern gymnasiums with courses leading directly to the universities. This was not, however, without periods of transition characteristic of the origins of schools in all countries. The new type of preparatory school edged its way in between the old grammar school and the arts course, overlapping in both directions. After a long period, during which the fields of the several types of institutions were but vaguely defined, a line was drawn in the nineteenth century between the gymnasium and the university, leaving to the former virtually the entire arts course of the early universities. Thus the German university abandoned the old ideal of liberal education and general mental discipline in favor of specialized technical training. The Reformation in England had no such effect on English higher schools.

The colleges of the English universities, with their separate buildings, organizations, and community life, were so firmly established, and fortified by tradition, so safe from the encroachments of state secondary schools, that they have survived, with insignificant changes, even the insistent demands of modern times. Instead of the somewhat antagonistic gymnasium, there arose in England the great public schools—such as Winchester, Eton, Rugby—dominated by the universities and in full sympathy with them. Thus the English college has retained as its aim the training of the faculties for use in all the needs of life,—its ideal a liberal rather than a technical education.

It was this arts course and this ideal that the early settlers sought to transplant in America, and here almost at once began the Old World custom of crowding down the elementary subjects into the programs of the lower schools. From the founding of Harvard College in 1636 to the present day, this process has continued. Toward the end of the eighteenth century, this process helped to establish the academy, in some respects an intermediate school between the colleges and the old Latin grammar schools. The history of the academy suggests the German gymnasium. It took over more and more of the work of the early college; and the college responded, at first rather reluctantly, to the constant pressure to add new subjects to its curriculum. When the prescribed course was found to give the student a little of everything and not much of anything, the overloaded curriculum broke down of its own weight. Then the elective system evolved as a means of relief and helped to continue the process that had been going on for centuries. Inevitably the average age of graduation from college was increased by several years, demands came for a shortening of the college course, and the whole question of the place of the College of Liberal Arts in American life became one of increasing importance. (See articles on COLLEGE COURSE, LENGTH OF; GRADUATION, AGE OF.)

Meantime the most significant influence on the college from below has been the growth of the public high school. Under independent municipal management and enthusiastic public support; responding more and more to the demands for practical education; of recent years conscious of its power and throwing off the shackles of college control; reaching farther and farther into the domain once held by the college alone; the public high school has produced in America a situation similar to the one which in Germany long ago resulted in the elimination of the arts course as a separate institution. From above have come two movements, first, the establishment of many professional schools with high school graduation as the standard for admission; and, second, the development of graduate

schools of arts under the influence of German universities. The old English arts course and the new German arts course, with conflicting ideals, have produced some confusion wherever they have found their way into the same institution. Few administrators have seen clearly the distinct sphere and function of each type of arts course. The result has been what is called the invasion of the liberal arts course by professional studies. Inevitably the college within the university has suffered by this confusion with graduate schools. It has failed to keep its distinct sphere, to retain a faculty of ablest men devoted primarily to its needs, or to develop a pedagogy of its own, made imperative by changing conditions of size of classes, curriculum, and social needs. All of these historical movements, except the development in America of the graduate arts course under German influence, have affected alike the college within the university, whether under state or private control, and the isolated small college. Out of it all the great problem of the college has come insistently to the front. The early years of the twentieth century mark a period of trial and transition for the college, the outcome of which is not yet evident.

**DEFINITION OF THE COLLEGE.** — The nearest approach to a generally accepted definition of what should constitute a college is that framed by the Carnegie Foundation for the Advancement of Teaching (*q.v.*): "An institution to be ranked as a college must have at least six professors giving their entire time to college and university work, a course of four full years in liberal arts and sciences, and should require for admission, not less than the usual four years of academic or high school preparation, or its equivalent, in addition to the pre-academic or grammar school studies." In this definition four years of preparation for college are supposed to cover fourteen units, a unit being a course of five periods weekly throughout an academic year of the preparatory school.

As a matter of fact, however, the terms "college" and "university" usually indicate something inferior to the standard set by the Carnegie Foundation. Although nearly a thousand institutions in the United States and Canada call themselves colleges or universities, not one fourth of these are standard institutions, according to the definition given above. So long as there is no general agreement concerning the lines of demarcation between high school and college and between college and university, there are found numerous "universities" that are inferior in all essentials to the better city high schools. Nor, unfortunately, can it be determined whether an institution meets the standard by an examination of its publications, for there is frequently a grievous discrepancy between the promise of the catalogue and the performance of the "college." Until the standardizing influences recently

begun have had further time for uplifting and elimination among institutions aspiring to rank as colleges, the most trustworthy lists are those approved by the General Education Board (*q.v.*) and the Carnegie Foundation for the Advancement of Teaching.

**HISTORICAL DEVELOPMENT.** — (Detailed accounts of the development of the more important colleges are given under each separate title, *e.g.* Harvard, Yale, etc.) Among the 21,000 persons who came to New England from 1620 to 1640, — the date of the assembling of the Long Parliament, — were about 100 graduates of Cambridge and Oxford. This proportion of one graduate to about 200 of population was as large as prevailed in any country in the seventeenth century. These men brought with them such college standards and methods as they had known. Harvard College (*q.v.*), founded in 1636, which for more than fifty years remained the only college in America, was largely the product of Emmanuel College, Cambridge. Emmanuel was a Puritan foundation, made by Sir Walter Mildmay in 1584. It is told that Sir Walter, who was the chancellor of the exchequer of Queen Elizabeth, was asked by the great Queen regarding his laying of the Puritan foundation. He is said to have replied: "Far be it from me to countenance anything contrary to your established laws, but (aside he added) I have set an acorn which, when it becomes an oak, God alone knows what will be the fruit thereof." From the acorn thus planted sprang the first college of America, and so, in a degree, many other colleges in the following generations.

John Cotton, Thomas Shepard, and Thomas Hooker, builders of the early Massachusetts Commonwealth, were graduates of Cambridge and of Emmanuel. From Magdalene, Cambridge, came the first president of Harvard College, Henry Dunster (*q.v.*); from Trinity, Charles Chauncy (*q.v.*), the second president; from Peterhouse came John Norton, the interpreter of the doctrine and discipline of the Church; from Trinity also came the leader of the Bay colony, John Winthrop; from Jesus came the apostle to the Indians, John Eliot (*q.v.*); from Emmanuel came, above all others, John Harvard (*q.v.*), who, through his books and a gift of half of his estate, though small, became the founder in a peculiar sense of the college in the new Cambridge. It may be added that the larger number of college-bred men of the New England colonies were found in Massachusetts Bay. Of the 100 souls who came over in the *Mayflower* not one had received a college degree. Elder Brewster was the only liberally educated man in the company, but his education had not covered the full university period. The relation between the old Cambridge and the higher education in America, therefore, is a relation definite, vital, and for many years dominant.

Although seventeen years before Harvard

College was established endeavors had been made to found a college in Virginia, it was not until 1693 that a permanent charter was obtained. Even then it was not obtained without opposition. When Dr. James Blair, a Scottish Episcopal clergyman, the founder of the college, went to Attorney-General Seymour with the royal command to prepare a charter, he was met by remonstrances against the expensive liberality, Seymour declaring he saw no occasion for a college in Virginia. Dr. Blair replied that ministers of the church were needed there, as the people of Virginia had souls as well as those of England, and that a college was necessary to educate them. "Souls!" exclaimed Seymour in reply, "damn their souls! Let them make tobacco." But the charter was soon granted, and the college entered upon a career of prosperity which, with certain lapses, it enjoyed down to the Revolutionary War.

The foundation of Yale College (*q.v.*) in the first year of the eighteenth century was likewise the result of a long-continued endeavor. As early as 1648, ten years after the beginning of the New Haven colony, steps, which proved to be ineffective, were taken for the starting of a college. More than fifty years elapsed before the actual foundation was made. In the first year of the eighteenth century a few ministers of the colony petitioned the authorities for a charter, and also engaged to give their own books for its endowment. The charter as granted indicated a desire to uphold and propagate the Christian Protestant religion by a succession of learned and orthodox men. It also expressed the wish that the youth might be instructed in the arts and sciences, and might, through the blessing of Almighty God, be fitted for employment both in Church and State.

Almost fifty years passed after the foundation of Yale before the establishment of another college. In 1746 Princeton, in 1754 Columbia, in 1757 the University of Pennsylvania, in 1764 Brown University, in 1766 Rutgers, in 1770 Dartmouth, represent the noble succession. (See articles on each institution.)

These six colleges, together with Harvard, William and Mary, and Yale, were largely the product of the Church. Harvard College was founded chiefly for the purpose of maintaining a creed and for the education of ministers. Of its 76 graduates between 1642 and 1656 at least 59 became ministers. Indeed, of all the graduates down to 1700 more than half were clergymen. A similar proportion prevailed at Yale for its first half century. (See COLLEGE GRADUATES, PROFESSIONAL DISTRIBUTION OF.) The chief aim of the founders and early friends of Princeton was to furnish the Church, and especially their own branch of it, the Presbyterian, with able ministers. Their secondary purpose was to provide a liberal education for all classes. Columbia had for its first governors ministers of the Church of England and also of the Presbyterian, Lutheran, Dutch Reformed, and the

French Protestant churches; and its first class of eight students was taught in the vestry room of the schoolhouse attached to Trinity Church. In the organization of Brown University the Baptist Church, and in the organization of Rutgers College the Dutch Reformed, exercised a controlling influence. In the charter of Rutgers it is affirmed that it was founded for the education of youth in the learned languages, liberal arts and sciences, and especially in divinity, preparing them for the ministry and other good offices. The planting of Dartmouth was the result of the great religious awakening of the first half of the eighteenth century.

In the establishment, therefore, of the nine colleges planted before the outbreak of the Revolutionary War, English conditions prevailed. The motives, too, were religious or ecclesiastical. In most cases the motives were sectarian, but with the narrower motive was mingled a large human purpose. Religion was used as a method for the betterment of men and "for the glory of God," as well as to promote denominational enlargement.

The Declaration of the 4th of July, 1776, contained intimations of our intellectual and academic freedom from Great Britain. So fundamental and vital was the separation that the suggestion was made to establish a new language in the place of the English. Acts which made the colonies independent in political and civil affairs also served to make them independent in affairs educational. In this condition the United States turned for aid and comfort to the traditional enemy of England—France. French officers, commanding French armies and French fleets, cooperated with the American forces. Frenchmen, gentlemen of scholarship and culture, visited the country for scientific, literary, or political purposes. The American Academy of Arts and Sciences (*q.v.*), incorporated in Massachusetts in 1780, proposed to give itself "the air of France, rather than of England, and to follow the Royal Academy rather than the Royal Society." President John Adams said that it was the talks which he had with scholars in Paris that gave him the idea of the formation of the Academy.

The French influence exerted upon the general educational condition is indicated in various ways. In 1784 the corporation of Harvard College received an offer from the King of France to furnish a botanic garden, which the college desired to establish, with every species of seeds and plants which might be required from his royal garden at his own expense. At the same time, too, an attempt was made to found a French Academy of Arts and Sciences in America, with headquarters in Richmond. Its projector, Quesnay, was the grandson of the famous French philosopher and economist, Quesnay, who was Court Physician to Louis the Fifteenth. He came to this country to aid in the Revolution, serving as a captain in Virginia. After giving up

military life because of ill health, he traveled through the country, and in these travels conceived the idea of introducing French arts and culture, believing, also, that he could multiply the relations uniting France and this country. The institution was to be national, having branches at Baltimore, Philadelphia, and New York, and also international, being affiliated with similar institutions in Europe. It was designed to give what we might now call graduate instruction. Its curriculum was sufficiently broad, including foreign languages, mathematics, architecture (civil and military), painting, sculpture, engraving, experimental physics, astronomy, geography, chemistry, mineralogy, botany, anatomy (human and veterinary), and natural history. This endeavor interested many people both in America and France. No less than sixty thousand francs were raised toward the endowment. Among the subscribers to the fund were about a hundred of the representatives of the best culture of Virginia. On July 1, 1786, the corner stone of the building was laid at Richmond, and one professor was appointed. He was Doctor Jean Rouelle. But in 1786 France was in no condition to enter into schemes of education or other propagandism outside of her own territory, and the formal endeavor presently came to an end.

On the tombstone of Thomas Jefferson, at Monticello, are three inscriptions indicating that he was the author of the Declaration of Independence, of the fundamental law of Virginia guaranteeing religious freedom, and that he was also the founder of the University of Virginia. In his endeavor for the higher education, a work which Mr. Jefferson regarded as of signal importance, he was largely influenced by the methods, ideas, and purposes of France. While he was minister at Paris he made investigations of the French system of education. The University of Virginia, established in 1825, embodied the French model. He regarded Edinburgh and Geneva as the best foreign universities. At one time it was suggested, by reason of political dissatisfaction, that the leading professors of the University of Geneva should as a body transfer themselves to Virginia. The project, of course, like that of Quesnay, was not feasible, but in the final organization of the university near Monticello the French method of separate schools prevailed. Religious freedom, which characterized and still characterizes the university, represents the French rather than the English tradition. Another manifestation of French influence on the higher education of America is seen in the organization of education in the Territory of Michigan. It is specially represented in an endeavor to found what was for a time known by the dreadful name "Catholepistemiad." The project included the establishment of thirteen professorships, also known by outlandish terms. No religious condition was to obtain in the election of members to the board

of trustees. This scheme, too, begun in 1817, like the scheme of Quesnay, came to an end in the form in which it was projected; but it was the germ whence sprang, twenty years later, the University of Michigan.

While the discussions between Jefferson and his friends were going on in relation to the establishment of a university in Virginia, the influence of German scholarship and teaching was beginning to be felt. For a hundred years this influence has been enlarging and deepening. Although Benjamin Franklin was a visitor at Göttingen in 1776, and although at the same university, in 1799, a Pennsylvanian, Benjamin Smith Barton, took his degree of Doctor of Philosophy, it was not until the first decades of the nineteenth century that the influence of the Germans upon American education became evident. In the second decade of the century begins the long list of Americans, who have been students at the German universities for a longer or shorter time. Among the pioneers are Edward Everett, George Tieknor, George Bancroft, Henry W. Longfellow, and J. Lothrop Motley. Motley was a student at Göttingen in 1833. Following him at Göttingen in the next score of years were J. E. Cabot, the biographer of Emerson; Theodore Dwight Woolsey, president of Yale; Benjamin Apthorp Gould, the astronomer; George M. Lane, the Latinist; Francis J. Child, the English scholar; Henry Boynton Smith, the theologian; Horatio B. Hackett, John L. Lincoln, and Roswell D. Hitchcock. The larger number of Americans who went to Germany as students in the first half of the nineteenth century went to Göttingen. The reason for the choice is not evident, but, aside from the attractiveness of the university itself, it is probable that Göttingen, being situated in Hanover, and Hanover belonging to the English Crown, represented a less foreign country than did Prussia or Saxony. Previous to the year 1850 in the universities of Göttingen, of Berlin, and of Leipzig, about 150 Americans were enrolled.

These periods, which may in a general way be interpreted in their prevailing influence as English, French, German, are also, in respect to interior conditions, to be interpreted as ecclesiastical, private, and public. As the colleges founded in the early period were English, and as these English colleges were quite entirely under the control of the Church, the ecclesiastical influence predominated. Following this period, a period which may be interpreted as private or personal became dominant. Colleges were founded by individuals as individuals, not as members of a church. Such colleges are Williams, Bowdoin, and Amherst. This second period was succeeded by a period which may be called public or national, in which the college or university was established as the crown of the public educational system of the state. The state university embodies

the essence of this period and movement. (See UNIVERSITY, STATE.) It is not to be understood that these periods are in point of time distinct. The ecclesiastical period projects itself down to the present day, and of course the private or personal still obtains.

In the first years following the close of the Revolutionary War, while the churches were engaged in the administration of colleges already founded, or in the establishment of new colleges, no small share of the body of people came to realize that their needs were not fully met by institutions already existing. Too many of these colleges were the colleges of a sect or a faction. They were not colleges for and of the whole body of people. As this feeling deepened and broadened, it became apparent that the need could be met in one or both of two ways. One method was the method of supervision of and coöperation with existing institutions. Through such a relationship it was thought that these institutions might become more closely adjusted to the needs of the Commonwealth. The second method of the people ministering to themselves through the higher education was the establishment of new institutions to be administered directly by the people.

In various forms the adjustment of the old institutions to modern society was attempted, but the results of the attempts were vain. The Dartmouth College Case (*q.v.*) illustrates such an attempt. It was only after the lapse of half a century and more that the adjustment of the ecclesiastical or private institutions to modern needs was accomplished. Therefore, throughout the nineteenth century endeavors, many and earnest, were made to found new institutions under the full and direct control of the Commonwealth. Out of this desire to promote a most vital type of the higher education sprang such grants of land as followed the passing of the great Ordinance of 1787 (*q.v.*) and the issuing of the Symmes patent in 1794. In the first half of the last century grants were made for the establishment of institutions of the higher education in 22 states and territories; and through 32 acts of Congress, passed largely in the same period, somewhat over a million acres were granted for the endowment of universities. By means of what is known as the Morrill Act (*q.v.*) of 1862 and acts amendatory of it about 10,000,000 acres have been granted to no less than 45 states in aid of the higher education. This vast amount of public domain, though allotted primarily for the endowment of agricultural and mechanical colleges, has frequently become a part of the endowment of the university of each of the states concerned. The value of these vast donations it is now impossible to estimate, but it is probable that the states have realized from them no less than \$250,000,000. (See NATIONAL GOVERNMENT AND EDUCATION.)

The two and a half centuries and more of the higher education in America represent, furthermore, a general enlargement of purpose, method, and constitution. The first colleges were founded in no small degree as schools of theology. The clerical purpose was succeeded by the purpose of training men for the great business of living. The later colleges, as well as the older, have ceased to be professional schools; but not a few of them have called into being, as distinct educational agencies, schools for training men for the great professions. Although some schools of theology still continue to exist on distinct foundations -- as Andover and Newton -- yet schools of medicine and of law are usually integral parts of the university system, and many schools of theology are integral parts of a university, such as the Methodist school in Boston and the Congregational school in New Haven. The first schools of law and the first schools of medicine -- as the medical school in Philadelphia, founded in 1765 and the law school at Litchfield, founded in 1784 -- were independent schools. The first law school connected with a university and authorized to confer degrees was established in Harvard in 1817. (See LAW, EDUCATION FOR THE; MEDICAL EDUCATION; MINISTRY, EDUCATION FOR THE CHRISTIAN.)

In the enlargement of the function of the university has been founded the school of graduate studies. Its purpose is to promote the cause of research, to enrich the scholarship of the student, and to serve as a training school for teachers in higher institutions. Thirty years ago this agency was beginning its great career of usefulness in and through the university. Its students numbered about 200. In a generation it has so increased as to represent a student body of more than 5000, and has so enlarged its facilities as to become one of the most significant forces of the higher education. (See RESEARCH, ENDOWMENT OF; UNIVERSITIES, AMERICAN.)

Schools, too, in a greater or less degree of a practical nature, have been included in the university. Most conspicuous of these schools are the technical or scientific. Although a large number of such schools still rest on an independent foundation, yet the great universities, as Harvard, Yale, Columbia, Cornell, and Princeton, embrace schools of science as part of their organization. Agricultural, commercial, pharmaceutical, pedagogical, and library schools are also included. The growth of such technical, professional, or semiprofessional schools in the last twenty-five years of the last century, in respect both to number of students, equipment, and public influence, has been great. (See TECHNICAL EDUCATION.)

Thus in the two and a half centuries since the foundation of Harvard, the higher education, beginning with the college designed as a training school for ministers, has been enlarged to

include all of the sciences and not a few of the arts. The university has become a great human agency for the promotion of scholarship, for the enriching of manhood, and for professional equipment.

In the development of the American university the life of the undergraduates has become highly organized. Whether students live together in dormitories -- a method prevailing more in the institutions of the East than of the West -- or in private lodgings, their life is subject to many and diverse relations. Fraternities, strictly so called, clubs, and societies of all sorts are formed. In such universities as Yale and Harvard more than seventy-five undergraduate organizations are found. They exist for purposes most diverse and with constituencies large or small, compact or loose, homogeneous or heterogeneous. Clubs political, musical, literary, social, dramatic, debating, religious, æsthetic, athletic of all kinds are the more common. (See FRATERNITIES; STUDENT EMPLOYMENT; STUDENT LIFE, etc.)

The athletic organization of undergraduate life has become the most significant of all forms. The beginnings of such organization appeared about sixty years ago. As early as 1840 football was played at Yale, but it was, as then played, largely a scrimmage between the sophomore class and the freshman. For the next thirty years the game was played with much irregularity, both in time and method. It was not until the year 1873 that an intercollegiate league was formed. The members of the class of 1844 at Yale and of 1846 at Harvard formed the first boat clubs in those colleges; and in 1852 Yale challenged Harvard to a race, which was rowed on Lake Winnepesaukee on Aug. 3, in which the challenging college was defeated. Baseball was introduced at Yale in 1859, and at Harvard three years later. Harvard played her first intercollegiate game with Brown in 1863, and Yale her first intercollegiate game with Wesleyan in 1865, and the first Harvard-Yale game dates from 1868. From these simple origins the three college sports have so progressed that they now occupy no small part of the emotional interest of undergraduates and absorb their more superficial enthusiasms. These games represent, too, the point where the public, through the newspaper, most readily touches undergraduate life and affairs. (See ATHLETICS, EDUCATIONAL.)

There are other distinct concrete features of the American university which should be included in this sketch. Among them are the alumni associations, the system of fraternities, and the university clubs. These, with other topics related to the college, are discussed under the appropriate heads, or under the title UNIVERSITY AND COLLEGE.

C. F. T.

COLLEGE CURRICULUM. — From the founding

of Harvard College in 1636 to the Revolutionary War the college curriculum in America was for the most part a faithful following of the studies that had been pursued in English universities by the promoters of higher education in the New World. As late as 1764 the influence of the mother country is shown in the Charter of Brown University, which empowers the institution to "Confer any and all the Learned Degrees which can or ought to be given and conferred in any of the Colleges and Universities in America, Europe, and particularly in the University of Cambridge, and Edinburgh in Great Britain." The avowed object of all of these colleges, on both sides of the Atlantic, was to raise up a body of learned men, especially men for the Christian ministry.

The laws of President Dunster of Harvard, adopted in 1642, and now preserved in the archives of the university in the President's own handwriting, indicate the scope of the first college curriculum in America. The document opens as follows: "Every scholar that on proof is found able to translate the original of the Old and New Testament into the Latin tongue, and to resolve them logically, and shall be imbued with the beginnings of natural and moral philosophy, withal being of honest life and conversation, and at any public act hath the approbation of the Overseers and Master of the College, may be invested with his first degree; but no one will expect this degree unless he shall have passed four years in college and has maintained therein a blameless life and had sedulously observed all public exercises." In advocating the change from the three-year course, with which the college started, to a four-year course, President Dunster is at pains to point out that "the scholars will not thus remain in our college one minute longer before they become M.A. than ordinarily they do in all the Cambridge colleges in England." The requirements for the degree of Baccalaureate in Arts at this time read: "The first year shall teach Rhetoric, second and third years Dialectics, and the fourth year shall add Philosophy. . . . In this course of four years each one shall dispute twice in the public schools and shall respond twice in his own class; which if he performs, and is found worthy after the regular examination, he shall become an A.B." This was the curriculum of Oxford and Cambridge, which all but one of the American colleges sedulously followed during the period of colonial dependence, and the influence of which survives to-day in our oldest institutions. The curriculum was itself a heritage of the ancient Trivium (*q.v.*) (grammar, rhetoric, and dialectic) and Quadrivium (*q.v.*) (arithmetic, geometry, music, and astronomy). Influenced by the Church, however, the curriculum of Cambridge, England, in the early years of the college at Cambridge, Mass., had become little more than Latin and Greek,

with much drill and disputation in Aristotelian logic and philosophy, to which was added some elementary mathematics and a few scraps of physical science.

The first college curriculum in America, as published in *New England's First Fruits*, reveals a three-year course, as follows:—

(1) Mondays and Tuesdays: Philosophy, comprising logic and physics for the first year, ethics and politics for the second year, arithmetic, geometry, and astronomy for the third year. For each morning, theory; for each afternoon, practice in philosophical disputations. (2) Wednesdays: Greek for all classes. For the first year, etymology and syntax, with afternoon practice in the rules of grammar; for the second year, prosody and dialectics, with practice in poesy after dinner; for the third year, more Greek in theory and practice. (3) Thursdays: theory of Hebrew, Chaldee, and Syriac grammar with practice in corresponding Biblical texts. (4) Fridays: rhetoric, with English composition and declamation. (5) Saturdays: mornings, "Divinity Catechetical" and "Common Places," *i.e.* scholastic disputations; afternoons, history in the winter, nature of plants in the summer. This curriculum of President Dunster remained substantially unchanged during the entire seventeenth century.

Yale owed its early curriculum to Harvard, and, in turn, passed it on to Princeton. For nearly a century after the founding of Harvard, there was no important change in the studies. Then Yale received some valuable "philosophical apparatus": surveying instruments, a telescope, a microscope, a barometer. This was the humble beginning of the scientific studies, which, just a century later, were to demand a curriculum of their own, parallel to the classical course leading to the B.S. degree.

During the middle of the eighteenth century, some provision is found for the study of chemistry, astronomy, geography, algebra, trigonometry, conic sections, and fluxions. Benjamin Franklin's gift of electrical apparatus is received at Yale, and James Bowdoin's "generous donation of an Orrery" at Harvard. French is now and then permitted as an extra course. But divinity supported by Hebrew remains the crowning study of the curriculum; and the General Assembly of Connecticut, in 1753, declares anew "that one principal end proposed in erecting the college was to supply the churches in this Colony with a learned, pious and orthodox Ministry." Up to this time the New World seems content with the meager curriculum of the Old World. The new ideals and the new studies were to come with the breakdown of traditions in the Revolutionary period, the consciousness of national life, and the need of training for citizenship.

The announcement of King's College (now Columbia University) in 1754 heralded a

broader course of study. Children are to be taught not only goodness, but "such useful knowledge as may render them creditable to their Families and Friends, Ornaments to their Country and useful to the public Weal in their Generations. . . . As to Religion, there is no intention to impose on the Schollars, the peculiar Tenets of any particular Sect." About this time William Smith drew up his *General Idea of the College of Mirania*, the first independent effort in America to construct a logical curriculum, and the first clear statement of the modern aim of good and efficient citizenship. The author of this enlightened plan was elected First Provost of the "Academy" in Philadelphia. There, in 1756, he secured the adoption of a liberal scheme of studies. It included not only the classics and elementary mathematics, but surveying, navigation, dialing, and Euclid. In the third year came ethics and physics, the laws of nations, government, trade, and commerce. Physics included mechanics and experimental philosophy, astronomy, natural history, chemistry, and agriculture. For private hours readings were recommended in a wide range of subjects. Throughout the three years of the course the professional needs of theologians, of first importance in the contemporary curricula of Harvard, Yale, and Princeton, were at Philadelphia subordinated to the practical needs of all students. Provost Smith himself says that this early curriculum of the institution that was to become the University of Pennsylvania, the first modern college curriculum in America, was faithfully carried out, and with great success.

William and Mary College, from its foundation in 1693 to the Revolution, had virtually the Oxford curriculum. In 1779 came radical changes. In that year Thomas Jefferson became Governor of Virginia and one of the Visitors of the college. He says, "I effected during my residence in Williamsburg that year a change in the organization of that institution, abolishing the grammar school and the two Professorships of Divinity and Oriental Languages, and substituting a Professorship of Law and Police, one of Anatomy, Medicine and Chemistry, and one of Modern Languages; and the Charter confining us to six professorships, we added the Law of Nature and of Nations and the Fine Arts to the duties of the Moral Professor, and Natural History to the Professor of Mathematics and Natural Philosophy." President Madison said, in 1780, "The Doors of ye University are open to all, nor is even a knowledge in ye ant. Languages a previous Requisite for Entrance." This liberal program of William and Mary, freed from the control of any particular sect, instituted by statesmen, dominated by the democratic ideals of the American Revolution, marks the close of the Colonial Period in the history of the college curriculum in America.

It must not be supposed, however, that there was any sudden and general expansion of college programs. Academic groups are too conservative to admit anything but the most gradual evolution. Even after the new light was brought from without to shine on the old college of William and Mary, the program at Yale for the first three years of the course, as indicated by President Stiles's *Memoranda* of Nov. 29, 1783, was still mainly Latin, Greek, and mathematics, although some time was given to English grammar, logic, geography, rhetoric, and philosophy. In the senior year the Greek Testament was prescribed, with Locke's *Human Understanding*, Clap's *Ethics*, and the occasional addition of such books as Edwards *On the Will*.

At Harvard, about this time, the first significant change in the colonial curriculum permits those who are not preparing for the ministry to take French instead of Hebrew. But modern languages are everywhere regarded with suspicion, both by the defenders of the classics and by the defenders of orthodox religion. Before the close of the century considerable attention is given to scientific studies, beginning with a course of lectures on Natural History for "such students as shall obtain permission under the hand of their parents or Guardians to attend." Even more liberal in its recognition of science and government is the course of study adopted at Columbia University, though Princeton and Rhode Island College, under its influence, are not much affected by the new trend. Chemistry, the first science to attain a worthy place in the college curriculum, was first taught in the medical schools of Pennsylvania and Harvard. By 1820 the subject was included in the curriculum of nearly every American college, covering several topics, such as heat and electricity, that were later differentiated under the name of physics.

The decade 1820-1830, as we shall see later, marks a virtual renaissance in higher education in America. Most conspicuous in this movement is Thomas Jefferson and the University of Virginia. "A system of general instruction," he declared, "which shall reach every description of our citizens, from the richest to the poorest, as it was the earliest, so it will be the latest of all the public concerns in which I shall permit myself to take an interest." The curriculum for the University of Virginia, when it was opened in 1825, was one that Jefferson had been constructing during thirty years of study of institutions at home and abroad. The studies were arranged in ten homogeneous groups: (1) ancient languages, (2) modern languages (including Anglo-Saxon), (3) mathematics (including architecture), (4) physico-mathematics (including astronomy), (5) physics, chemistry, and mineralogy, (6) botany and zoology, (7) anatomy and medicine, (8) government (history being interwoven with politics and law), (9) municipal law, (10) ideology (in-

cluding ethics, rhetoric, and fine arts). This program was not only the most comprehensive of its time, but was the first university curriculum in America to be administered under a virtually complete elective system.

It was between the years 1820 and 1830 that Charles Follen became instructor in German at Harvard College, and George Ticknor, under the influence of Göttingen and more especially the University of Virginia, developed the department of Modern Languages at Harvard College, and Henry W. Longfellow, who was to succeed Ticknor at Harvard, was elected instructor in the French, Spanish, Italian, and German Languages at Bowdoin College. But at most of the colleges French was permitted merely as an "extra" study, a social accomplishment for which a special fee was charged. At the same time the faculty of Amherst College announced a Science Course in which French and Spanish were substituted for the Latin and Greek of the traditional course. The University of Vermont made a similar abortive venture. At Norwich University in Vermont, Captain Partridge advertised most of the undergraduate studies of our present classical, technical, and military schools, and all under an elective system and unfixed term of residence. Similar freedom of opportunity in the academics of the time was one influence in the broadening of the college curriculum. During this same decade Rensselaer Polytechnic, the first technical school in this country, was established, and economics found a place at Harvard, Yale, Columbia, Bowdoin, Dartmouth, and Princeton. American translations of Say's *Political Economy* and mathematical texts of Laplace and La Croe gave an impulse to these studies. The distinctly modern trend of this decade in the history of the college curriculum is well shown by the inquiry of the Visiting Committee at Bowdoin College, "whether the course of instruction ought not to be more of a practical and less of a scholastic character, and to this end whether the study of the Greek language in this College ought not to be optional with the student." Yet in this same decade Yale University gave its powerful influence to a retroactive movement. The report of its committee on a liberal course of study, published in 1827, prescribed every study that a liberal education demanded, and attempted to place the entire curriculum on a basis of formal discipline and to fix it once and for all in final perfection. The doctrines of this Report not only hindered progress at Yale throughout the century, but cramped college programs wherever the influence of Yale was felt. Western Reserve College (now University) aimed to become the "Yale of the West," and many another little Yale preserved its conservative traditions in the West and South.

It was in 1822 that William and Mary College established the first professorship in history. Such teaching of history as had long been given

by professors in the classics and in theology was unsystematic and subsidiary to the traditional college subjects. Even after Jared Sparks, in 1839, became the first professor of history at Harvard College, the subject received but scant recognition in most colleges, and this as incidental to politics or philosophy. It was not until after the Civil War that Yale established a chair of history. History and economics as we know them to-day in American colleges are modern subjects.

From the remarkable development of the third decade until the close of the Civil War, the development of the college curricula under the influence of such ideals was necessarily slow. The "new" ideas adopted at Cornell in 1867 are in essence those of the Amherst report of 1826. The whole period was one of conflict between the old doctrines and the *Lehr- und Lernfreiheit* that inspired many an American student in Germany with a truly liberal idea of university study. If any date indicates roughly the final dominance of German ideals and the consequent beginnings of the modern period, it is the year 1869, when Charles W. Eliot became president of Harvard University.

During the past half century the college developed its curriculum under the pressure of institutions above it and below it. The first colleges in America adopted the medieval arts course as it had survived in the modified curricula of English universities, the dominant purpose of the course being general rather than special training. Presently, the traditional professional schools of law, medicine, and theology took their places beside the arts course. Later, under German influence, came the graduate school of arts, with its emphasis on special, technical training, in contrast to the general preparation of the older arts course. The professional schools and the new graduate school pressed on the college curriculum from above, each demanding a part of the older arts course. With rare exceptions the new graduate arts courses with their new ideals were not conceived and maintained as separate institutions. At the same time the American high school, growing rapidly in public favor and in recognition of the needs of the great numbers who could not go to college, brought its influence to bear on the college curriculum from below. Between these two millstones, even the venerable arts course, protected by tradition, ever reluctant in its response to public demands, was nevertheless profoundly modified. And the pressure is steadily increasing. Never before has the college felt from all sides such insistent demands for reorganization.

As the dominant influence on the early curricula was English, and later French, so the dominant influence during the last half of the nineteenth century was German. Throughout the century the history of the college curriculum is the record of institutions, under conservative influences, forced by the growth of human

knowledge and the demands of an increasingly complex civilization, to take up one new subject after another, and present them in more vital relations to present social, industrial, and political needs. It is in response to such felt needs, rather than in conformity with any theory of what should constitute a liberal education, that economics and sociology, in numerous branches, history, government, and allied subjects, have now such prominent places in the colleges of to-day. Courses in education, for example, were offered twenty-five years ago in barely half a dozen higher institutions; to-day they are found in nearly three hundred. Equally noteworthy during this period has been the development of college instruction in English language and literature. In 1846 the Lawrence Scientific School was established at Harvard to offer a course parallel to the classical course and leading to the degree of B.S. From that time to the present day, at first slowly and then rapidly, scientific courses have taken their place in nearly all colleges, and have risen from suspicion and from the real inferiority of their beginnings, until to-day the problem in many institutions is to save the traditional A.B. course from being crowded out by the more practical scientific studies. The adoption of the laboratory method has quickened the study of the sciences that thus edged their way into the programs of a century ago, and at the same time has brought due recognition to geology, biology, and psychology. Finally, the general adoption of the elective system, with or without requirements for concentration and distribution of studies, has left the subject matter of the curriculum open to indefinite development, unhampered by the protective tariffs imposed by the formal discipline theorists of earlier days.

W. T. F.

**ADMINISTRATION OF THE COLLEGE CURRICULUM. — The Elective System.** — On pages 63-65 is traced the development of the college curriculum and incidentally of its administration on a prescribed or an elective basis. While the University of Virginia, under the influence of Jefferson, offered the first definite example of freedom of choice of studies on the part of the student and an embodiment of what is now called the elective principle, yet here the principle was controlled by the following faculty rule: "The degree of graduate shall be conferred on those only who have acquired an accurate and extensive knowledge of the subject of one or more of the classes, or in any single language. But it is to be understood that in all cases the candidate shall give the faculty satisfactory proof of his ability to write the English language correctly." The idea of the elective principle was carried to Harvard by George Ticknor and given slight recognition in the statutes of 1825. Here, as in other colleges later, the elective principle received its first recognition in connection with modern lan-

guages; therefore these found their first recognition usually as extra studies.

In 1826 students could take modern languages after the first third of freshman year in place of specified courses in Greek, Latin, topography, Hebrew, and natural science, and seniors might substitute natural philosophy for a part of intellectual philosophy. As modern languages were almost the only subjects available for election, the freedom of choice was less than it appeared to be. Brown University at this time offered its juniors, in the third term, calculus or French, and its seniors, in the third term, Hebrew or French. There were no other options.

In 1834 Professor Ticknor reported that, owing to the adoption and full application of the volunteer system, the amount of study and progress in each modern language had been greatly increased; in some sections doubled within eight years. Yet it appears from the meager offering of electives that, except in modern languages, the administration of the college curriculum remained in 1835 substantially what it had been before the adoption of the statutes of 1825. In 1838 the Corporation provided that students who had completed the freshman mathematics might discontinue the subject, and take in its place natural history, civil history, chemistry, a course in geography, and the use of the globes, or studies in Greek and Latin additional to the prescribed course. It is suggestive of the early difficulties in providing any real freedom of choice that the college, after announcing this apparent extension of the elective system, felt obliged to add the warning that the college might not be able to provide the proposed alternative of natural history, civil history, and chemistry.

Following the adoption of the new curriculum of 1841, various regulations were made each year. They illustrate the way in which courses of study have been patched up, with rare exceptions, throughout the history of the American college. Any one who traces the varying fortunes of various subjects in the administration of almost any college is at a loss to discover evidence of sustained and enlightened leadership. Upon the accession of President Everett at Harvard, in 1846, the advocates of the elective system and the opponents of any change contrived to patch up a compromise curriculum. Although it probably satisfied nobody, it was prescribed with little change for the next twenty years. This program permitted juniors to elect three of the following studies: Greek, Latin, mathematics, German, and Spanish. For the seniors, Italian was added to the elective list. All other studies were prescribed.

President Sparks, an opponent of the elective system, discovered in 1852, the last year of his administration, a condition which has remained an unanswerable argument against the rigidly prescribed college curriculum. "The volun-

tary system," he said, "is still retained to a certain extent, rather from necessity than preference. The number and variety of the studies for which the university has provided instruction are so large that it is impossible for any student, within the period of four years, to give such a degree of attention to them all as will enable him to acquire more than a limited and superficial knowledge from which little profit can be derived."

In 1856, through another curtailment of elective privileges, the system reached its lowest ebb, and here it remained until after the Civil War. The faculty of 1865-1866 (twenty men with 414 students) was no better prepared to provide a broad curriculum than the faculty of twenty years before. Yet it set out at once upon that policy of decreasing prescribed studies and increasing elective studies which Harvard College followed consistently during the long administration of President Eliot.

The curriculum was no longer at the mercy of chance and compromise; a principle was to guide the administration of studies at Harvard College for the next forty years. In 1872 the senior year became wholly elective; in 1879 the junior year; in 1884 the sophomore year; and in 1894 the single absolute requirement that remained in the entire college course — English A — could be anticipated by an entrance examination. Any one who wishes to follow in detail the development of the system at Harvard College under the leadership of President Eliot, should read with care his annual reports and those of the Dean of Harvard College. Abundant materials are there, all of great value to men of every shade of opinion regarding the merits of the system that President Eliot so long and so ably defended.

*Elective System in other Colleges.* — The reform movements of the third decade of the nineteenth century were not confined to Charlottesville and Cambridge. In 1826 the first volume of the *American Journal of Education* called for reforms in the established system of collegiate education. In the same volume, Captain Partridge advocated certain reforms which he had already achieved in his school at Northfield, Vt. In that institution, which became Norwich University, neither the program nor the length of the course was prescribed. It was in 1825, also, that the trustees of Bowdoin College voted to establish a professorship in modern languages, and to take up the whole question of the curriculum in a thoroughgoing manner. A few years later, the Visiting Committee changed their earlier tentative suggestions to a declaration in favor of elective studies.

In the same year, 1826, the faculty of Amherst College published a report clearly setting forth the need of a more liberal administration of the college curriculum. One of the results was the adoption of the first clearly conceived division of college studies into a classical course

and a scientific course. The previous year, students at Amherst had but a single option, "recitations in Hebrew twice a week, if desired." Within a few years the whole college was again confined to one rigidly prescribed course.

Toward the middle of the century the most enlightened utterances concerning the American college were made by Francis Wayland, President of Brown University. In his *Thoughts on the Present Collegiate System*, he protested against continuing to force all students through all subjects, regardless of their interests, aims, or capacities. He showed how superficial nearly all instruction had become because of the overloaded curriculum. Union College, for example, in 1849, mentioned thirty-three subjects for juniors and seniors. Maryville College, in Tennessee, prescribed seventy-seven subjects for all students. President Wayland declared that the amount that colleges were trying to teach under the prescribed régime had doubled, if not trebled, while the time available remained exactly the same. (See COLLEGE COURSE, LENGTH OF THE.) It was inevitable that such programs should break down of their own weight.

W. T. F.

**PRESENT TYPES OF COLLEGE CURRICULA.** — A comparison of the courses of study in the different colleges and universities of the United States reveals variations so great that common principles are not obvious. They vary from those in which the whole course of study is prescribed to those in which almost everything is elective; and between these extremes there are many forms, and seldom two alike. A course of study usually proves, however, to be the result of an attempt to carry out one or more of four different purposes. These are: (1) To include those subjects which by virtue of their content, their practical value, or their value for mental discipline, are regarded as essential to a liberal education. (2) To provide for a varied and broad education and to prevent too early and too narrow concentration in some one subject or field. (3) To prevent, on the other hand, too great a diffusion of effort and to insure a certain amount of concentration. (4) To give to the student an opportunity to exercise his individual preferences and to discover and develop his special aptitudes by making selection among a number of different subjects which are regarded as having approximately equal educational value.

The first demand is provided for in the *prescribed studies* which are to be found in practically every course of study. The second is met either by prescribed courses in several different departments or by the requirement that courses be selected from each or several of a number of different groups, or fields. The third is provided for by holding the student to the completion of a number or series of courses in one or more subjects, which are in some cases prescribed and in others elective. The fourth finds scope in the free elective courses, and usually

also in the privilege of choosing the subjects in which to concentrate.

Opinions differ regarding the relative importance of these four purposes and the best way of carrying them out, hence the great variety in college curricula. Three main types may be distinguished:—

A. That in which all the work for the degree is prescribed.

B. That which prescribes part and leaves the rest to the choice of the student. Individual instances vary greatly in regard to the proportion prescribed.

C. That which (1) contains prescribed courses, (2) requires concentration in one or more departments selected by the student, and (3) leaves a certain proportion open for free election.

A. *The First Type.*—A course of study of the first type is not to be found at present in any institution of prominence, though it is closely approached in the curricula of some of the sectarian institutions. It is the type of the curriculum of a century ago, and it existed with only slight modifications for many years. The increasing number of subjects which demanded recognition made it impossible to include everything in the curriculum, and some slight measure of choice, usually among closely related subjects, came to be allowed. The increasing demand, on other grounds, for privilege of election led to modifications more or less extensive.

B. *The Second Type.*—The second type is of very frequent occurrence. It was the form taken by the curriculum in most colleges when the movement in the direction of the elective system began to gain strength. In some cases very little was left to the student's choice, in others, almost everything; but in most cases there was a compromise, with the advantage ordinarily rather in favor of the prescribed courses. Such a curriculum usually makes some provision for each of the four demands.

Haverford and Union colleges furnish good illustrations of this type. In the course for the A.B. degree at Union College the work of the freshman year is prescribed. It includes Greek, Latin, rhetoric, mathematics, physiology, gymnastics, and either French or German. In the sophomore year the student is required to take Greek, Latin, English and rhetoric, physics, hygiene, German or French, and history or mathematics. In the junior year English and rhetoric, logic, psychology and ethics, geology, astronomy, and evolution are prescribed, while seven out of sixteen year-hours are elective. In the senior year English and rhetoric, economics and sociology, are prescribed; thirteen out of seventeen year-hours are elective. Such a course of study provides breadth and comprehensiveness by including among the prescribed studies certain courses in each of several fields. Language, literature, philosophy, mathematics, natural science, and the social sciences are all represented. In many colleges history is included in

the list of prescribed studies. A fair measure of concentration is required in Latin, Greek, English, and rhetoric. The twenty elective year-hours give the student opportunity either to concentrate still further in a few departments, or to divide his work among many.

A very different example of the same general type is found in the curriculum of the Schools and Colleges of Arts, Letters, and Sciences of the University of Chicago. In it the elective principle receives more recognition. Certain courses are prescribed (nearly 40 per cent for the A.B. degree). Certain others are prescribed, if not offered at entrance; and the rest, normally about 50 per cent, are elective. Twelve "major" (*i.e.* courses meeting four or five times weekly for one quarter year)<sup>1</sup> must be "senior" courses (*i.e.* belonging to the "Senior College" or the last two of the college years). *Not more than fifteen "majors" may be taken in one department.* There is thus a wide field for election, with no definite provisions for concentration outside of the prescribed courses, nor for distribution outside of these and the limitation of the number of majors that may be taken in one department. For the A.B. course the prescribed subjects are one "major" in philosophy, one in psychology, three in Greek, three in Latin, two in English, two in mathematics or science, and one in public speaking. There are four other courses of study, one for the B.S. degree, two for the Ph. B., and one for the Ed. B. They differ in detail and in the amounts of prescribed and elective work respectively, but the plan is the same in all.

The former Harvard curriculum, in which almost the whole course was elective, was an extreme form of this type.

C. *The Third Type.*—The third type is found in many progressive institutions, and it has been steadily gaining ground. In this type the prescribed courses provide for the subjects which are regarded as indispensable; usually they provide also for a certain amount of distribution, and in some cases for a certain amount of concentration, but in a good many cases the prescribed courses are so few as to be of little use for such purposes. Besides the minimum of concentration which may be insured in this way, there is an additional requirement for concentration in one or more subjects (usually called *major* and *minor* subjects) which the student may select from a number of departments, divisions, or groups.<sup>2</sup>

<sup>1</sup> The term *major* describes ordinarily the subject in which the student chooses to specialize. See the Third Type of Curriculum. The usage at the University of Chicago is not that generally recognized.

<sup>2</sup> The term "group" means usually a division made up of closely related subjects, *e.g.* natural sciences. At Johns Hopkins it means a whole course of study in which two or more closely related subjects are central. At Princeton it means a grade, "group I," being about equivalent to grade A. At Yale "group" is almost synonymous with "department." An "examination group" is made up of the subjects for which the term examinations fall on the same day and hour.

Further specific provision for distribution is present usually, but not invariably.

The free electives may of course be employed in the direction either of greater distribution or of greater concentration.

Individual instances vary greatly, and before comparing representative cases it will be well to consider more closely some of the elements in this type of curriculum.

1. *Prescribed courses* are a characteristic feature, though in some cases they are very few in number. The subjects which are prescribed, even for the A.B. degree, are seldom exactly the same in any two institutions, and in many cases the differences are very great. English composition is the only course prescribed in more than one half of the ninety-two leading institutions, representing all types; but English, including Composition or Literature or Rhetoric, or any two or all of these, is prescribed in eighty-seven of the ninety-two. Latin is prescribed for the A.B. degree in thirty-one out of ninety-two; Greek in only thirteen; French in six; German in seven; a foreign language, with or without some choice as to which it shall be, in seventy-seven. Trigonometry is prescribed in forty-one of the ninety-two; solid geometry in twenty-seven, advanced algebra in thirty-seven; analytical geometry in thirteen; calculus in three; mathematics, including one or more of these, in sixty-seven. As a rule the subjects which are prescribed are those which were a part of the curriculum of half a century ago, though several newer subjects appear in the list, and one of them, physical education, ranks high in the list of prescribed subjects.

The following table shows the frequency with which a few certain broadly defined subjects appear as prescribed studies in four different classes of institutions.

SUBJECTS PRESCRIBED FOR THE A. B. DEGREE IN

	41 Endowed Colleges	14 Endowed Universi- ties	9 Colleges for Women	29 State Universi- ties
History . . . . .	19	7	6	15
Philosophy . . . . .	16	8	8	8
(Phil. Log. Eth.)				
Psychology . . . . .	18	2	6	1
Bible Study . . . . .	16	1	6	
Natural Science . . . . .	26	11	9	15
Foreign language . . . . .	32	12	9	24
English . . . . .	37	14	9	27
Mathematics . . . . .	32	10	7	19
Physical Education . . . . .	19	7	3	12

Subjects and Groups. — History and mathematics may be regarded as *subjects*. The term "natural sciences" seems rather to indicate a *group* of subjects. Groups of subjects were the inevitable outcome of the attempt to grant some freedom of choice without giving up altogether certain kinds of subject matter, or of discipline. In natural science some colleges prescribe physics, some chemistry, some require one or

the other, some require one from a group which includes all the natural sciences. The tendency has usually been toward an enlargement of such groups, limited in many cases only by lack of equipment and of teaching force. The existence of prescribed *subjects* in a curriculum implies that there are certain specific things which the holder of a bachelor's degree should know, or should have learned to do. The substitution of a *group* for a *subject* represents the view that he should know a certain *kind* of thing, with the privilege of some degree of choice as to which thing of that kind he shall study.

The curriculum of Columbia College requires that every candidate for the A.B. degree shall study English composition and literature, trigonometry, solid geometry, advanced algebra, European history, logic and scientific method, certain Latin authors, two years of French or German, physical education, and one or more of a group of laboratory sciences.

The curriculum at Harvard requires the student to study rhetoric and English composition and French or German, and to select studies from *each* of four different groups, viz.

- (1) Languages, literature, fine arts and music.
- (2) Natural sciences.
- (3) History and political and social sciences.
- (4) Philosophy and mathematics.

In each case there is provision for study in certain particular fields and for a broad course of study. Harvard obviously allows to the student a wider latitude in the selection of what he shall study in a given field. He need not study philosophy, history, nor languages, if he prefers mathematics, political science, and the fine arts. These two courses of study represent typical methods for securing breadth, and typical attitudes with reference to the question of indispensable subjects.

2. *Provisions for Concentration.* — The feature most common to all cases of this third type is the method of providing for concentration. Some provision may be made, as we have just seen, by means of prescribed courses, but in addition to these the student is required to specialize to a certain extent in one or more subjects, which he is permitted to select with more or less freedom. The courses making up the specialized work in a given subject (a *major* or *minor* subject) must ordinarily form a sequence or be of graded difficulty; only a minimum of the work may be of an elementary character. Harvard now requires that six courses should be taken in one department or recognized field for distinction. Columbia requires two three-year sequences (a sequence is made up of connected courses of graded difficulty in one department), one of which, for the A.B. degree, must be chosen from a group including languages, literature, history, and philosophy. Cornell requires ten year-hours, during the junior and senior years, in one of twelve groups.

The degree of concentration required in different colleges and universities varies greatly. In sixty-eight institutions selected on the basis of the comparative simplicity of their regulations, the median case falls in the 18-20 per cent group: half the cases fall in the conspicuous 12-22 per cent mode: the range of concentration requirements is from 6 to 35 per cent of the total degree requirements. See Table.

PERCENTAGE OF TOTAL WORK REQUIRED IN MAJOR SUBJECTS

Per Cent	23 State Univers- ities	13 Endowed Univers- ities	7 Women's Colleges	25 Small Colleges	Total
6-7.9				1	1
8-9.9				1	1
10, etc	1		1	4	3
12	1			4	5
14	2	1	1	5	9
16	3	1		3	7
18	5			1	6
20	1	2	2	1	6
22				1	1
24	2		2	2	6
26	1				1
28		2			2
30	1			2	3
32		1	1	1	3
34		1			1

3. The curriculum of this type usually permits the student to elect from one fourth to one half or more of the work of the course. He may therefore study a wide variety of subjects, if he so desires, or he may (in most cases) specialize still further in the subjects of his choice.

Further Illustrations of the Third Type. — Harvard and Columbia Colleges have already been cited as illustrations of this type of curriculum. Yale College furnishes an example of a variety of this type which has found much favor. On a basis of a certain number of prescribed subjects (which are, in this instance, only indirectly prescribed), there is built up a set of major and minor courses which must among them represent each of a small number of groups. These courses are usually chosen at the end of the freshman year. The Yale curriculum requires the student to take a major (connected graded work of at least twelve hours) and one minor (connected graded work of at least 5 hours) in one of three main divisions, and one minor in each of the two other divisions. The divisions are: (1) languages, literature, and the arts; (2) mathematics and the physical and natural sciences; and (3) philosophy, education, history, and the social sciences. Further provision for concentration is made in the requirement that the student continue for one year the study of three of the subjects (within the limits of Greek, Latin, French, German, English and mathematics) which he offered for admission. Such a curriculum makes it necessary for a student to get more than a smattering of at least three or four subjects. It leaves him free to concentrate most of his work in a very few subjects, which, how-

ever, must not all lie in the same field. (See YALE UNIVERSITY.) A four-group system, such as that of Harvard, and still more, a six-group system like that of the University of Virginia requires an acquaintance with a larger number of the great fields of knowledge, but in most cases, except those in which there is a wide variety of prescribed courses, it is possible for the student to leave out of his course of study certain of the subjects which were formerly regarded as essential to a liberal education.

The course of study in the academic department of Princeton University presents another variety. All the studies of the freshman year and three courses out of five in the sophomore year are prescribed. These studies include Latin, Greek, mathematics, modern language, English, physics, and philosophy. At the end of his sophomore year the student chooses his department for the junior and senior years, but as this choice is largely conditioned by his selection of electives in the sophomore year, he must choose to eliminate certain departments at that time. There are four divisions, each containing one or more departments: A. (1) philosophy, (2) history, politics, and economics; B. art and archaeology; C. language and literature (1) classics, (2) English, (3) modern language, Germanic section, (4) modern language, Romanic section; D. mathematics and science (1) mathematics, (2) physics, (3) chemistry, (4) geology, (5) biology. In his junior year the student must take all the junior year courses offered by his department. They are usually two in number, sometimes three. In any case three of his five courses must be in the division in which his department lies; one course must be outside that division, and the remaining one is left to his free election. In the senior year he must take three of his five courses in his department, or if not so many are given, he must take three in the division in which his department lies.

In this curriculum full provision is made for concentration. The student must take six courses in his department (if so many are given) in addition to the prerequisite sophomore subject, which is usually in the same department, making frequently seven in a given field out of a total of twenty courses for the degree. The prescribed courses provide for a good measure of comprehensiveness, and the requirement that one junior year course be taken outside the chosen department looks in the same direction. Eleven departments are open to the candidate for the A.B. degree at the end of his freshman year, and although his choice of sophomore electives limits his field of selection at the end of that year, he would usually still find several different departments open to him. This is the most important field for the exercise of election, since the number of free electives is small.

Another important variety is illustrated in the curriculum of the college of Johns Hopkins

University. The curriculum is made up of groups, but these groups differ from the groups spoken of above in that each group is a complete course of study containing (1) certain subjects in common with all the other groups; (2) certain others peculiar to itself; and (3) optional subjects. There are five of such groups: (1) ancient languages; (2) modern languages; (3) history and political economy; (4) mathematics and physics; (5) chemistry, biology, and geology. In each of these groups the principal subjects must be studied for at least two years. In the ancient language "group" the course is as follows: first year, Latin, Greek, *English composition, mathematics, natural history*; second year, Latin, Greek, *English literature, general history, French or German, vocal training*; third year, *physics, German or French, forensics*; with Greek and Latin advised and one course a free elective; fourth year, philosophy with Latin and Greek advised and two courses elective. The subjects in italics are prescribed in each group, except that in some of them another laboratory science replaces natural history, and in some political economy replaces history. Physical exercises also are prescribed. The student must choose his "group" on entering. The choice is virtually among several curricula of the second type with three fourths of the work prescribed and one fifth more advised, leaving about one seventh to entirely free election. Breadth and concentration are well provided for. After the initial choice, election plays but little part. The College of the City of New York has a similar curriculum.

The five different courses for the bachelor's degrees at the University of Chicago bear to one another a relation like that between the different "groups" at Johns Hopkins. In fact, every college which offers a course of study of the second type for each of two or more degrees might be regarded as having one course of study of the third type, the student being required to select his group or major on entering college.

An extreme variety of the third type is found in the curriculum of Leland Stanford Junior University. The prescribed work is reduced to a single semester hour in English composition, and that may be offered for admission. There is no grouping of subjects. The student is required to select a major subject in some one department. That department has the authority to require the completion of this major subject, and also of such minor subjects in other departments as may be considered necessary or desirable collateral work; the major and minor subjects taken together are not to exceed one third of the undergraduate course. No further specific provision is made for the inclusion of studies from the several fields of knowledge. Almost everything is left to the discretion of the student and of the department of his major subject.

In by far the larger number of cases the student selects the subjects in which he is to specialize at or before the beginning of the sophomore year, and pursues his studies in them for at least three years. In a few instances, as for example at Johns Hopkins, he must make his selection at the beginning of the freshman year. In other cases, as at Princeton, he may postpone his choice till the beginning of the junior year.

In most colleges the adoption of a curriculum of the third type has followed a trial of one of the second. At Johns Hopkins there was a very early attempt at the construction of a curriculum of the third type, and the present curriculum at that institution is simply a modified and improved form of that adopted when the collegiate department began its existence. Johns Hopkins deserves the credit of having established the first successful curriculum employing the so-called "group system."

*The Group System.* — The term "group system" is usually taken to mean a course of study in which a student is required to concentrate in one or more fields, these fields or groups being made up of related subjects. Ordinarily the student is required to select subjects from each group. The essential principles of such a system, *i.e.* systematic concentration and diffusion, may be present, however, in a curriculum which does not arrange the departments in groups (*cf.* Columbia). The term "group" is not universal in this sense; at Yale the broad fields are called divisions, and at Johns Hopkins a group is a whole course of study. The third type of curriculum, as previously described, includes all cases of the group system and others employing the same essential principles.

*The Elective System.* — No separate type has been assigned to the elective system. Strictly speaking, there is no elective system; there is an elective principle, and it is one of the four employed in the construction of practically every modern curriculum. The privilege of election appears at various points in the student's college career. Usually he may choose between two or more bachelor's degrees. In those cases in which specialization is required, he may choose the subject or subjects in which he will specialize. In many cases, he may choose which modern language, natural science, etc., he will follow to satisfy a prescription. He is usually allowed a certain number of free electives. But there is no curriculum which is an illustration of the elective principle alone. It is simply one of the central ideas in educational doctrine as exemplified in American colleges.

*Courses of Study for the Several Bachelor's Degrees.* — Most colleges and universities offer more than one bachelor's degree in courses in the liberal arts and sciences. The degree of Bachelor of Arts has as its most frequent alternative that of Bachelor of Science. The degrees of Bachelor of Philosophy and Bachelor

of Letters are also of frequent occurrence. There is, however, little uniformity regarding the requirements for any one degree. Some colleges (for example, Princeton) require both Latin and Greek for the A.B. degree. Some require Latin only (Columbia, Williams, etc.). Some do not require any work in ancient languages.

The B.S. degree frequently means simply that the student has completed a course of study but is not entitled to the A.B. degree, usually because he has had no Latin, or if Latin, then no Greek. There is a tendency, however, to make the B.S. degree stand for some amount of specialization in science. The B.L. degree implies some amount of specialization in language and literature. The Ph.B. sometimes takes the place of the B.L., but its significance is, if possible, less constant than that of any of the others. (See DEGREES.)

*Courses for Honors.*—This feature so characteristic of English and Canadian institutions finds but slight favor in the United States. Two universities now offer special courses of studies for honors. In 1906 Princeton University established a course for special honors in mathematics and physics. The candidate for honors must receive no grade lower than the second (out of five grades). In 1909 a course for honors in the classical humanities was established. In this department the student begins his work for honors in the junior year. There are other differences, but the plan as a whole is similar to the one just described. In 1910 Columbia adopted a program of studies for the degree of A.B. or B.S. with honors. The student not a candidate for honors takes, besides certain prescribed studies and electives, two series of "sequential" courses (*i.e.* connected graded courses for three years each). The student who desires to become a candidate for honors chooses toward the end of his freshman year one department in which he will offer honor work. He is then assigned to a representative of that department, who acts thereafter as his faculty adviser.

The requirements for the degree with honors include a final examination in all the courses taken for honors. (See HONORS.) A. L. J.

**LENGTH OF THE COLLEGE COURSE.**—The first course of study planned by President Dunster was a three-year course. (See *New England First Fruits*.) Soon, however, he changed his view, stating that "four years, more or less, in college is necessary for students to remain, before they shall become baccalaureates, and an entire seven years before they shall receive the Master of Arts." And in 1654 it was recorded that "First degrees are denied to those of three years' standing." Yale followed the traditional Harvard course. In the middle of the eighteenth century the University of Pennsylvania covered at first three years, and so remained until after the Revolution. With the reforms of William and Mary

in 1780 an elective system was adopted and the length of term made variable. After outlining a remarkably comprehensive program of studies, for which he recognized that three years was too brief, Jefferson concludes, "Circumstances must always be regarded in the execution of every plan." President Madison wrote (1780): "The time of taking a degree was formerly the same as in Cambridge, but now depends on the qualification of the candidates." During the early nineteenth century the flexibility of the academies in adjusting themselves to the needs or demands of a community produced a strong pressure on the college toward modifications of its inflexible structure. President Wayland of Brown advocated courses parallel to the arts course, and a greater flexibility. "There is nothing magical or imperative," he says, "in the term of four years, nor has it any natural relation to a course of study."

Except for the rare instances already cited, the college course held rigidly throughout the country to the four-year period, from the middle of the first century of colonial settlements to recent times.

Within the last quarter century, however, this phase of college life has been subjected to keen criticism. The very first article in the first number of the *Educational Review* (1891) was one by Daniel C. Gilman on "The Shortening of the College Curriculum." Discussions concerning the length of the college course have been numerous, and several plans for the administration of the curriculum have been adopted looking toward greater flexibility as to time requirements for the A. B. degree. For many years President Eliot had urged the reduction of the time of required residence. In his report for 1883-1884, he advised either the formal adoption of a three-year course or plans whereby a majority of students would be encouraged to complete their work in less than the traditional period. The faculty of Harvard College recommended to the Corporation, in 1890, four steps looking toward a three-year course. Only one of these was agreed to by the Overseers, namely, "When a student enters college there shall be placed to his credit . . . (1) any advanced studies on which he has passed in his admission examination beyond the number required for admission, and (2) any other college studies which he has anticipated." The same year (1890) Columbia University adopted another plan enabling students to shorten their college and professional studies by one year, by which seniors could elect their studies from courses offered by the faculties of philosophy, mines, laws, and political science, and thus be prepared, upon graduation to take up at once their second year of professional study. Other universities offered similar opportunities for the overlapping of collegiate and professional courses. At about the same time the University of Chicago (*q.v.*) under the

leadership of President Harper offered an original answer to the question by providing a four-year course and a two-year course, and permitting students of exceptional ability to do the work in three years. Those who completed the work of the two-year course, or Junior College, were called Associates in Arts. (See, *Educ. Rev.*, Vol. 19, p. 411.) The devisors of the plan expected the following five results: (1) that many students would give up work at the end of the second year; (2) that many students who otherwise would not go to college at all would take the two-year course; (3) that professional schools would be able to raise their standards of admission; (4) that academies and high schools would be encouraged to develop higher work; (5) that many colleges would be satisfied to do only the Junior College work. As might have been expected, the whole plan met the general opposition of the colleges.

Still another plan for enabling the better students to graduate in three years without taking an excessive number of courses was proposed by President Hyde of Bowdoin College. It is known as the "Credit for Quality" plan. It allows courses passed with high grades to count more toward a degree than courses passed with low grades. The plan has been in operation for some time at the University of North Dakota, and to some extent at Columbia University, Chicago University, and the University of Missouri.

A decade later the discussion concerning the shortening of the college course was taken up with new vigor. Between 1900 and 1905 no less than fifty articles appeared on the subject. Before the proposal to shorten the course to three years had found much favor within the conservative walls of American colleges, when only two — Johns Hopkins and Clark — had frankly established a three-year course, President Butler of Columbia gave a new impetus to the whole controversy by advocating a two-year course for the A.B. degree. In his *Annual Report* of Oct. 6, 1902, he favored a two-year course for admission to the higher schools of the university on the ground that a longer course unduly postpones the period of self-support for those who enter the professions. He favored removing the bachelor's degree from the artificial position to which it had been raised by the extension of high school courses, and conferring it upon the graduates of a two-year course, reserving the degree of Master of Arts for the graduates of a four-year course. The same year, 1902, Harvard College announced that it would at once confer the degree of A.B. on students who completed the requirements in three years, instead of requiring students, out of deference to a harmful tradition, to wait a year for degrees already earned. Similar plans were at once adopted by Brown University and by the University of Pennsylvania.

Growing importance attached to the question after Harvard and Columbia began to insist on the A.B. degree as a prerequisite for admission to the technical schools. While this tendency met with much opposition at first, the movement has resulted in raising professional standards and has generally been accepted by the colleges as essential.

Only two colleges in good standing have frankly adopted the three-year course as the norm, and discouraged students from spending more than three years in their work for the A.B. degree. These institutions are the collegiate departments of Johns Hopkins University and Clark University. Clark College was favored in the experiment from the beginning by the lack of traditions, by ample funds, by a faculty large enough in proportion to the number of students to do actual teaching in all courses, by a ban on intercollegiate athletics and their accompanying distractions, and by a plan of admission requirements theoretically superior to the traditional methods of the older colleges.

Through all the prolonged discussion as to the length of the college course there appears to emerge substantial agreement among competent judges on these points, all of which have direct bearing on the question at issue. (1) The ordinary high school education is inadequate preparation for professional school studies. (2) A four-year college course between high school and professional school unduly postpones the age at which a man may enter his lifework and support a family. (3) Absolute uniformity in the requirements for admission to professional schools in the United States is at present neither possible nor desirable. (4) The American college, the one type of institution peculiar to the United States, must protect its essential character as a school of liberal culture from the pressure of other institutions. (5) The various degrees stand greatly in need of generally accepted definitions. (6) The work of the General Education Board and of the Carnegie Foundation for the Advancement of Teaching has strengthened the better colleges, intensified the struggle for existence of the weaker colleges, and thus helped to define the kind and length of college course which ought to lead to the baccalaureate degrees.

W. T. F.

**ADMINISTRATIVE BODIES.** — No uniform system of college administration can be said to exist in America; the variations are due to historical reasons or difference of constitution, *e.g.* of state and private colleges and universities. But two main types of forces may be distinguished, which may be called constants, *i.e.* found in all institutions, and variables.

(1) In constants are included: (a) Trustees; (b) Faculty; (c) President (*q.v.*), Secretary, and Treasurer; (d) Students. (2) In variables are included: (a) A legal body usually called Overseers (*q.v.*); (b) Dean; (c) Bursar; (d) Comptroller; (e) Visiting Committees; (f) Alumni Associations (*q.v.*).

The legal body, which usually calls itself Trustees, is sometimes called Regents or Fellows. The numbers of its members greatly vary, being seldom less than seven and seldom more than fifty. The terms of election vary from those of a close corporation to those of appointment by a denominational society, or, as in the case of a state university, to those of appointment by the Governor of a state or to an election made by the people.

The duties of this legal body are also many and diverse. "They relate to the management of the property both real and personal; to the distribution of the annual income of the university among the different departments of instruction and research; to the appointment of all officers and teachers in the university; to the salaries and retiring allowances; and to the enactment of the rules or statutes under which the regular work of the university proceeds. The Board also passes finally on all the educational policies of the university; but in this function it ordinarily follows the advice of the university faculties, or of the committees to which faculties have delegated their authority on certain subjects." (*University Administration* by Charles W. Eliot, pp. 6 and 7.)

A second legal body is found in a few colleges and universities. This body was introduced in the year 1642 into Harvard College. It is usually called "The Overseers." Yale College was founded with only one legal body.

The method of organization with one legal body only is that commonly found. The body of overseers has been criticized on several grounds. It is felt that its very numbers make it unwieldy, and introduce members who are in no way competent to deal with academic matters; that any administrative body should be in intimate touch with the university and its problems; that the fact that members of such a body represent different interests is no guarantee of unbiased and mature decisions. Those who support this view would leave the entire control in the hands of the faculties who are in intimate and daily contact with their problems and are less likely to register undigested and imprudent judgments. (For a complete statement see Dwight's *Travels in New England and New York*, Vol. II, pp. 212, 213.) The arguments which are emphasized in favor of a duplex system of organization differ very slightly from the usual arguments for a second chamber. Instead of hampering the faculty, a board of Overseers would rather act as a spur, for its support could only be secured for plans thoroughly digested and considered by the faculties. The very fact that members of the board are drawn from a wide area and different walks of life lends its opinions weight. As representatives of public opinion such a board is a valuable factor in guiding university policy. Further, one of the important duties, that of inspection of various departments, can be better exercised by an external body than by

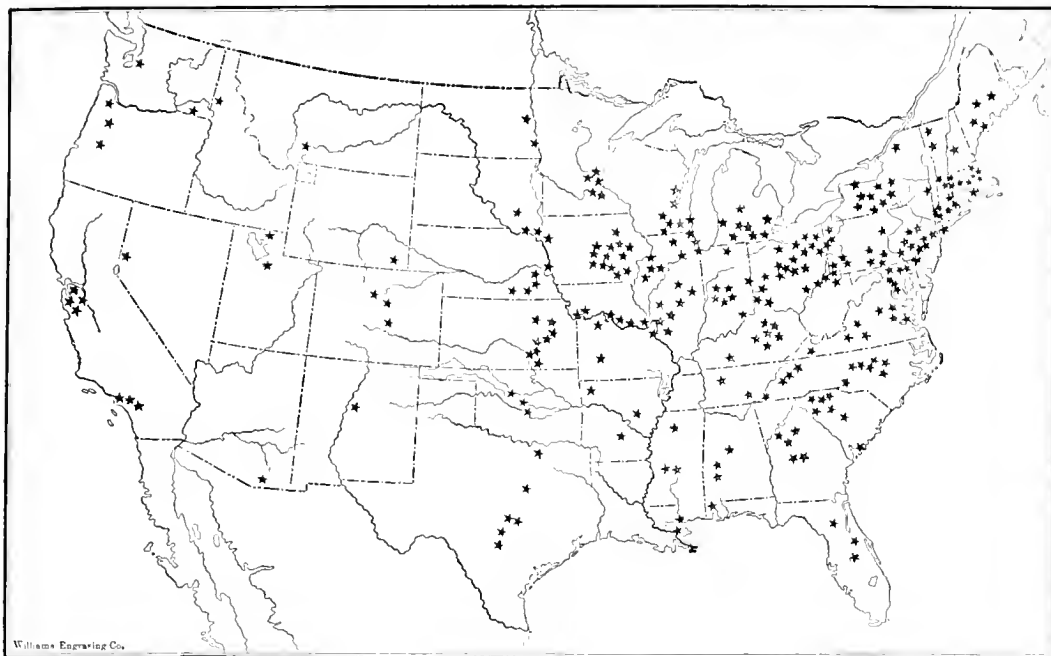

the faculty itself. (See Eliot, C. W., *University Administration*, pp. 50-53.) C. F. T.

**COLLEGES AND COLLEGE STUDENTS, GEOGRAPHICAL DISTRIBUTION OF.**—The number of institutions bearing the name "college" or "university" in the United States exceeds 800. Of these many are only secondary schools. Others offer a few courses of collegiate grade and enroll a few collegiate students in the upper classes, but most of the work done is of secondary grade. The statements which follow in this article are based upon a classified list of colleges which have enrolled in the regular four college classes, for the year 1908-1909, at least 100 collegiate students or which have endowment to the amount of \$100,000. In this category there are in the United States 261 colleges. This list does not include the agricultural colleges nor technological institutions. The geographical distribution of these 261 colleges is as follows: North Atlantic Division, 61; South Atlantic Division, 39; South Central Division, 35; North Central Division, 103; Western Division, 23. In terms of population there is one college in the United States for every 256,956 of white people. By main divisions the proportion is as follows:—

North Atlantic Division, 1 college to 338,326 of population.  
 South Atlantic Division, 1 college to 171,929 of population.  
 South Central Division, 1 college to 286,692 of population.  
 North Central Division, 1 college to 250,251 of population.  
 Western Division 1 college to 168,411 of population.

From these statements it will be seen, that in terms of population the Western Division is most fully supplied with colleges, with the South Atlantic Division differing only slightly. The North Central Division has colleges at about the average rate for the entire country, while the North Atlantic Division, which includes New England, New York, Pennsylvania, and New Jersey, has the fewest colleges in proportion to the population.

The following table shows the number of students from the several states enrolled in the four college classes of the 261 colleges listed, together with the ratio of students to whole population. From the tabular statement it appears that the largest number of students are sent from the State of New York and the smallest number from Nevada. There are four states which send less than 100, there are 27 states which send less than 1000, and there are 38 states which send less than 2000 students to college. In proportion to the population California sends the largest number to college and Missouri the smallest. The number of states sending 1 student to 500 of white population or less is 3; 1 student to 1000 or less, 24; 1 student to 2000 or less, 47. (See COLLEGE AND UNIVERSITY STUDENT ATTENDANCE.) E. C. S.

Geographical Distribution of Two Hundred and Sixty-one Leading Colleges.

	STUDENTS	RATIO TO POPULATION
Alabama	765	1 to 1308
Arizona	69	1 to 1346
Arkansas	519	1 to 1820
California	3043	1 to 461
Colorado	1131	1 to 466
Connecticut	1331	1 to 671

West Virginia	598	1 to 1801
Wisconsin	2553	1 to 806

**PROBLEMS OF THE COLLEGE.** — No one who has examined with care the educational writings of the past decade has failed to find abundant evidence that appears to warrant the verdict of the *Nation*: "The college is the least satisfactory part of our educational system, and has urgent need to justify itself." The growing dissatisfaction with the American college has recently culminated in (1) unified protest on the part of secondary schools against college entrance requirements and examinations which, made in the interests of the college, have proved deadening to the lower schools; (2) severe self-examination on the part of colleges as indicated by hundreds of addresses and published articles on the reorganization of the college; (3) the establishment of the Carnegie Foundation for the Advancement of Teaching (*q.v.*) and the effective use of its funds for the purpose of encouraging institutions to meet its standards; (4) the organization of the higher education associations for the special purpose of improving the internal and external conditions of the American college; (5) the increasing difficulties of the denominational college in meeting higher standards and the agitation of the question whether, in consideration of the avowed American policy of the separation of Church and State, any private institution should be exempt from taxation; (6) the occasional application of scientific methods in testing the efficiency of college methods of instruction, examination of candidates, grading of students, administration of the curriculum, etc.

*The Problem of College Teaching.*— One of the greatest, if not the greatest, problem of the college is that of securing more efficient teaching. Nearly a century ago we began to insist on the need of trained teachers for elementary schools. Our better normal schools and teachers' colleges have provided professional training for secondary school teachers. Not even to-day is there, on the part of administrators, any general recognition of the fact that a professor needs something more than a knowledge of the subject he wishes to teach. But the public is demanding better results; there is a widespread belief that the poorest teaching in the country to-day is found in college classrooms. The problem of developing a pedagogy suited to the needs of young men and women of college age and providing a training that will furnish better teachers for college classrooms is a problem that the leaders of higher education agree must be faced, though few institutions have yet made anything more than tentative beginnings.

Another condition that has given rise to this adverse criticism of college teaching is the lack of competent supervision. In the notable development of expert school supervision during the last half century, college teachers alone have been left without such guidance. Indeed, most of them would consider the critical visit to their classroom of an administrative officer as a violation of academic freedom. It is, as President Pritchett has suggested, one of the weaknesses of all organizations which look toward intellectual and spiritual results, that they tend to evade the accountability which falls to every other human organization. While the *privat dozent* in German universities, lecturing on the same subject as the professor, is sure to take away the students of an inefficient teacher, and thus serves as a constant stimulus to the older man, the head professors in American colleges are left as a rule with no obligations to meet any particular standards in their own departments, or to cooperate with other departments for the good of the whole institution.

*Problem of Adjustment to Secondary Schools.*— The historical origin of this problem of adjustment is set forth in the opening article on THE COLLEGE. The fact is that the American high school was not intended to fit nicely between elementary school and college. It was at first an independent institution, hailed as the "people's college." Gradually, however, on account of the pressure of the colleges and for want of any other definite measure of achievement, high school masters came to look upon preparation for college as the chief function of their schools. This they did although the interests of the majority were thereby neglected and the spontaneity and freedom of the schools were sacrificed. This entire subject is discussed in the following article on COLLEGE REQUIREMENTS FOR ADMISSION (*q.v.*).

*Problem of Oversupply.*— A problem that con-

fronts a large number of colleges arises out of the oversupply of such institutions, and consequent wasteful and demoralizing rivalry. Local patriotism, real estate booms, sectarian interests, and political jobbery have created more colleges than people are willing to pay for. Even institutions supported by the same state carry on a competition which results in extravagant duplication of courses and equipment, temptations to weakness or dishonesty in maintaining standards, and log-rolling in the legislature. In several states the university, college of agriculture, and normal school or engineering school, instead of cooperating in professional spirit are consuming much energy in petty rivalry and animosity. Whenever such a problem concerns only, or mainly, the institutions supported by a state, the solution is relatively easy. Other states are likely to follow the example of Iowa, in 1909, in abolishing rival boards of trustees and in creating a single state board of control, charged with the duty of seeing that every dollar is well spent and nothing wasted in institutional rivalry. But where the waste is due to the competition of weak colleges under private control, the problem is far more difficult. In one sparsely settled part of the United States, for example, are 7 colleges within a radius of 100 miles. In Ohio are 52 colleges. In Illinois, in addition to several strong institutions, are a score of colleges, no one of which has a sufficient endowment. Other states have an oversupply of colleges for men, resulting in undignified, ungenerous, and extravagant attempts to enroll more men, while not half the women who seek a college education can be accommodated. The problems of such institutions have of late years become intensified, for (1) the strengthening of the strong colleges by the endowments from the General Education Board and by the pension privileges of the Carnegie Foundation has tended toward the benevolent elimination of the weak colleges; (2) the distribution of the graduates of reputable colleges throughout the country and the diffusion of their ideas of what should constitute a college education make it increasingly difficult for the weaker institutions to secure additional funds and students; (3) as new comprehensive and impartial studies of the problems of higher education furnish guidance for prospective benefactors, they are less likely to endow enterprises that have been undertaken, in excess of the demand, through misguided devotion to creed or family or town. Under the decentralized administration of education characteristic of the United States, there is at present no direct means of enforcing combinations and distribution of functions in the interests of the general public. Each state may take steps toward the gradual attainment of such ends by adopting definitions of the terms "college" and "university" and of the various degrees. Meantime, the weaker institutions may be led by their difficulties to then adopt

names and pretensions consistent with their possibilities, and thus worthily serve their communities in less ambitious ways.

*Problem of the Denominational College.*—Of all the institutions in the United States included in the latest report of the Commissioner of Education under the head of colleges and universities, only 50 are controlled by state or city. There are 620 chiefly, if not wholly, supported by private funds. These private institutions have about twice as many students as the public institutions. Over 400 of them are avowedly denominational. About three fourths of these are under the control of Methodists, Presbyterians, Baptists, and Roman Catholics. The rest are known as Lutheran, Christian, Congregational, Reformed, Friends, United Brethren, Episcopal, Universalist, Evangelical, Moravian, Latter Day Saints, Seventh Day Adventists, and Church of God.

Sectarian colleges have been established in the belief that a church, in order to carry out its legitimate work and advance its cause, must control and direct a number of institutions of higher learning in which men may grow up trained in its ideals and devoted to its service. The great pioneer service of sectarian colleges during centuries when the State seemed unable to promote higher education is incalculable. Up to the time of the Civil War, a college with but small endowment and but meager equipment got along fairly well. Since that time the struggle for existence has become more and more severe. To-day the Middle West is dotted with denominational institutions that have long since found it impossible to compete with state universities in equipment, funds, quality of teachers; and power to attract students. The fundamental trouble arises when sectarian colleges are not primarily interested in education but in the propagation of a particular religious faith. Unless there is a change in the present unmistakable trend, unless sectarian interests rally with far greater material aid to the support of their colleges, most of these institutions must either become frankly of secondary school grade, or else must perform what now seems the impossible feat of combining their resources for the maintenance of one strong college where now a dozen suffer a precarious existence. Even if such far-sighted coöperation were possible, the question would still remain whether under modern conditions sectarian interests could not be more efficiently promoted by the method described above than by direct denominational ownership and control of higher institutions. See, for further discussion, COLLEGES AND UNIVERSITIES, RELIGIOUS AND DENOMINATIONAL CONTROL OF; and COLLEGE BOARDS IN EDUCATION, DENOMINATIONAL.

*Problem of the Small College.*—The small college may be defined roughly as an institution for undergraduate work with a student body of less than 400. Throughout the history of higher education in America, the small college

has been the normal type. The large college is a creation of recent decades. In the year 1850 no college had over 400 students. At that time Yale had 386, Harvard 297, Princeton 232, and Union 266. Dartmouth and Columbia and Amherst had less than 200, Dartmouth having 196, Columbia 179, and Amherst 176. Among other colleges having 100 and more were Brown, with 141, Williams, with 163, Hamilton, with 149, Wesleyan, with 104, the University of Vermont, with 107, and Lafayette, with 100. In point of mere numbers the small college is still typical; more than half of all the colleges belong to this class. Though the small college has been the normal type, yet with the growth of colleges the small college has been brought face to face with new problems.

The place and function of the small college may possibly be best represented by certain contrasts. In a small college the mere fact of a low enrollment permits of the development of those intimate relations between students among themselves and between students and teachers, and a consequent *esprit de corps*, which the large college with large numbers cannot hope to attain. The disciplinary influence of a strong personality can be more widely exercised where the numbers are not so large as to lead to the formation of small groups, factions and cliques. The larger institution on the other hand has material advantages which the small college cannot offer in the way of equipment, teachers, and experts, and at the same time the students through their diverse origins and varied interests react beneficially on each other. To the students of ordinary ability, the small college offers a heartier sense of sympathy and of fellowship; to the student of extraordinary ability, the large college offers richer advantages for higher development and greater increase of his power. To the student who is "working his way," wholly or in part,—and this student is about one in three,—the small college is less expensive, but as a rule it offers fewer opportunities for earning money. The large college costs more, but it is able to grant larger sums from its loan and other beneficiary funds, and, as a rule, to furnish better facilities for self-support. In this comparison it may be said, somewhat interrogatively, that the small college is better fitted to make thinkers, the large college to make scholars; the small college is better fitted to train men, the large to teach subjects; the small college is better fitted to train the individual, the large to discipline the whole community; the small college is better fitted to improve personal character, the large to disseminate truth. Such comparisons obviously do not justify the conclusion that the small college is best for all without reference to their ability, character, age, and needs.

In addition to the college problems already discussed, the small college has certain peculiar problems. One of these is the attempt to attract too many students. That college which, for

the sake of numbers, falls below the entrance standard of the colleges with which it competes, either in entrance requirements or in accrediting unsatisfactory schools, is in danger. Such a course means a temporary increase of the enrollment, but a permanent lowering of the college standard.

A second danger lies in abortive attempts to become a university. The greatest source of strength lies in doing well precisely that kind of work which university conditions render more difficult. In its desire to keep up with the times and to thicken its catalogue, it should not encroach on the work which in other countries and formerly in this country was regarded as the distinctive province of the university. Every college of considerable resources in funds is in danger of offering its students more than they can profitably receive. To provide technical training for undergraduates, to attempt to compete with the university, is to misconceive the purpose of the small college. To offer such subjects to the few who wish to remain for graduate work is beyond the means of most colleges and beyond the proper scope of all. The small college owes most of the time and highest service of its faculty to the undergraduates.

A third danger may be found in intercollegiate athletics. In the degradation of scholarship standards for the whole college, this is a factor which all but the blind can see, but which only the bold acknowledge. Not that the athletes as a whole stand conspicuously lower in scholarship than the other students as a whole. The danger lies in the influence of excessive interest in intercollegiate games on the *whole* student body; and in the influence on the minimum entrance and college requirements of the desire to win at any cost. (See ATHLETICS, EDUCATIONAL.) This is particularly true when they persist in competing with universities which draw their teams from ten times the number of men, and they are constantly under pressure, from their "friends" and their own mistaken notions, to admit and retain men whose only qualification is proficiency on the diamond or gridiron.

Two reasons which have hitherto induced men to choose the larger and older institutions have been prestige and educational advantage. But there can be no continued monopoly of either. The difference in prestige — due to age and to the fame of alumni — has been growing less through the years. But now that there are over 800 colleges in the United States, the influence of prestige in determining the choice of a college is not so conspicuously in favor of a few institutions. Stronger motives are governing to-day.

The undenominational small college, which refuses to lower its standard from any notion of the importance of mere numbers; which devotes its energies to its own mission as the

maker of men and leaves to the university its own distinct work of making specialists; which guards against the evil and employs the good in athletics; which evades the temptation to shift any considerable part of its teaching upon inexperienced, underpaid, and temporary assistants; which sees the extravagance of spending large sums for fine buildings and small sums for strong teachers; which avoids the large-college tendency to substitute mechanism for personality in administration; which is yearly a severer critic of itself than any outside agencies; such a college, open to the accredited graduates of every approved high school, offering a few elective courses in the most important branches of strictly college study, taught to small groups by scholars who are first men, governed by personal kindness rather than by general rules, encouraging various student activities which call for the exercise of every worthy faculty of every student, has a place so secure and so important that all the tendencies to-day in large colleges and in professional schools are serving only to strengthen the small college of this type against its real and supposed dangers.

C. F. T., W. T. F.

*Other College Problems.* — There are many other college problems that have been much discussed of late and that need further impartial and quantitative investigation. It is beyond the scope of the present work to do more than refer to most of these topics and indicate the main sources of information concerning them. A topical outline of the matters considered in the *Oberlin Report* (1908-1909, pp. 97-206) is the best available survey of the problems that to-day confront the student of the American college.

**COLLEGE AND UNIVERSITY STUDENT ATTENDANCE.**—First among the phenomena, revealed by a study of the modern higher educational system, and bearing all the others in its train, is the remarkable growth and spread of interest in higher education, and the consequent tremendous increase in the number of those pursuing advanced studies and receiving higher training.

Chart I deals with the conditions in Germany as disclosed by a study of educational

Total attendance of matriculated students at all German institutions of higher education. Curve "A" includes universities, polytechnics, and professional colleges. Curve "B" includes universities only.

statistics compiled from official sources.<sup>1</sup> An examination of Curve B of the combined attendance at the twenty-two German universities (including Braunsberg, Prussia) reveals at once a most striking fact. It will be seen that prior to 1870 (the year of the Franco-Prussian war) this attendance was fairly uniform (the yeast of the spirit of 1848-1849 can, however, be seen to have been slightly working), keeping regular pace with the population and thereby betokening a certain stable condition of the social order. Immediately after this date the curve takes a sharp upward bend, and an increase in attendance, growing much more rapidly than the population, is most pronounced. Nor does this increase show the slightest tendency to fall off. It is even more marked in the combined attendance at all the German universities, polytechnic and professional colleges above gymnasial rank, as shown in Curve A. Coincident with the Franco-Prussian war there is a sudden dip, naturally accounted for by the call on young men for military service; and the disturbed political conditions of 1887-1888 show in the form of an offset in both curves, more marked in B than in A.

At the beginning of the period of rapid development (1870), there was one matriculated student for every two thousand inhabitants, while in 1907 there was one matriculated student for every thousand inhabitants. This

<sup>1</sup> Lexis, *Public Education in the German Empire*; Aschersou, *Kalender der deutschen Universitäten*; and *Minerva*.

denotes twice as widespread a participation in the benefits of higher education; and, involving, as this must, higher personal efficiency, needs, and aspirations, it is not too much to claim that we are well on the way toward an entirely new social order; that we are in the midst of an intellectual renaissance of profoundest import, of a movement which is one of the most significant in the history of the development and progress of the race.

Were Germany alone in this movement, so broad a statement would be unjustifiable—but she does not stand alone, she is simply preceding the other nations.

Chart II deals with the statistics for the United States and is based upon data compiled

Total attendance at all American institutions of higher education, inclusive of men and women and exclusive of students in "preparatory departments." Curve "B" includes colleges and universities for either or both sexes, scientific and technical schools or colleges, professional schools of theology, law, medicine, dentistry, pharmacy, and veterinary medicine. Curve "A" includes all above and normal schools.

from annual *Reports* of the Commissioner of Education. Curve B gives the combined attendance at all the colleges, universities, scientific, technical, and professional schools, omitting preparatory departments. Up to the year 1885 is seen a condition of practical stability; but beginning with that year the curve takes an upward bend, and continues with no sign of falling off. There is repeated the same story told by the German curves, but beginning fifteen years later. In 1885 there was one student for every seven hundred inhabitants, twenty years later, in 1905, one for every four hundred—or, if the Normal School attendance is included as given by Curve A, one for every three hundred inhabitants.

Even though the United States shows the same phenomenon, the broad statement might have to be qualified. But the following table (I) shows that the movement is not confined to these two countries. Here it appears that Russia is the only western country of prominence which has not passed Germany's figure of the year 1870, namely, one student for two

## COLLEGE ATTENDANCE

thousand inhabitants. The strong leading position of the United States and Switzerland is noticeable. France, the other republic on the list, ranks third. The figures for attendance in other countries than the United States have been summarized from data furnished to the U. S. Commissioner of Education by the editor of *Minerva*. It is probable that they understate, rather than overstate, the numbers in those countries which do not issue adequate official educational statistics.

TABLE I

COUNTRY	POPULATION	NUMBER OF STUDENTS IN HIGHER EDUCATIONAL INSTITUTIONS, 1906-07	POPULATION PER STUDENT
United States	83,941,510 (Est. 1906)	283,395 (Incl. Normal Schools) 212,956 (Excl. Normal Schools)	296 394 330
Switzerland	3,463,609 (Cen. 1905)	10,511	330
France	39,252,257 (Cen. 1906)	50,935	771
Denmark	2,605,268 (Cen. 1906)	3,363	775
Germany	60,641,278 (Cen. 1905)	73,020 (Incl. Hearers)	830
Austria-Hungary	46,973,359 (Est. 1906)	51,691	909
Greece	2,631,952 (Cen. 1907)	2,836	928
Italy	33,640,710 (Est. 1907)	33,174	1,014
Belgium	7,238,622 (Est. 1906)	7,139	1,014
Netherlands	5,672,237 (Cen. 1906)	5,435	1,044
United Kingdom	41,190,231 (Est. 1906)	41,305 (Excl. 22,159 "Evening Students") 15,642	1,068
Spain	18,831,571 (Cen. 1900)	15,642	1,204
Roumania	6,585,534 (Est. 1907)	5,336	1,231
Sweden	5,337,055 (Cen. 1906)	4,032	1,324
Portugal	5,123,132 (Cen. 1900)	3,923	1,382
Norway	2,321,088 (Est. 1906)	1,500	1,547
Servia	2,676,989 (Est. 1904)	1,022	2,619
Russian Empire	149,299,300 (Est. 1906)	54,208	2,754
Bulgaria	4,035,623 (Cen. 1905)	1,324	3,048

Note. Population from *Statesman's Year Book*, 1908.  
Number of Students from *Report of U. S. Commissioner of Education*, 1908, Vol. I.

To analyze the forces underlying this great wave of emancipation remains a problem for the future historian. Here it must be sufficient to note the phenomenon and pass on to some of its effects. It is also to be noted in passing that going side by side with the great increase in numbers there has been a vast improvement in the standards of the educational institutions as affecting both their entrance requirements and their own grade of work. Whether as cause or effect, there has also accompanied this wonderful growth a remarkable broadening of curriculum and quite a complete change of emphasis on

## COLLEGE ATTENDANCE

what constitute the essential factors of higher training. Fundamentally this movement measures the success of the pressure insisting that the higher educational curriculum and opportunities conform to the social needs of the times.

TABLE II

RATIOS OF ATTENDANCE OF VARIOUS COURSES AT THE GERMAN UNIVERSITIES, TECHNICAL AND PROFESSIONAL COLLEGES

FACULTY	1830	1869	1905	RATIO	
				1869 1830	1905 1869
<i>Universities</i>					
Theology . . . .	6,076	2,986	3,846	0.49	1.29
Law and Finance	4,502	3,178	12,456	0.71	3.92
Medicine (including Dentistry)	2,355	3,140	6,142	1.33	1.96
Philosophy (incl. Philology, Mathematics and Science)	2,937	4,853	19,494	1.65	4.03
<i>Polytechnica</i>					
Architecture and Civil Engineering <sup>1</sup> . . . .		942	5,443		5.75
Mechanical and Electrical Engineering <sup>1</sup> . . . .		241	5,161		21.50
Chemical Technology . . . .		213	1,431		6.70
Special Branches		418	1,577		3.77
<i>Professional Colleges</i>					
Mining . . . .		144	686 [835 incl. hearers]		4.77
Forestry . . . .		306	309 [366 incl. hearers]		1.01
Agriculture . . . .		357	1,517 [1,698 incl. hearers]		4.25
Veterinary Medicine		267	1,120 [1,260 incl. hearers]		4.20
Commercial Universities			1,076 [3,098 incl. hearers]		

Unless otherwise stated, the numbers are for matriculated students only. The ratios are for matriculates.  
Population: 1869, 40,805,000; 1905, 60,641,278. Ratio: 1905:1869, 1.5.

It is of interest to compare this vast and increasing throng of students to a powerful stream which, refusing longer to be confined within narrow, artificial banks, has burst through and found its own natural channels. What these have been can be seen from the foregoing table (II) comparing the German student attendance in the various channels of work for the years 1869 and 1905.

It is folly to dream of checking this mighty stream or of turning it back into the banks of a narrow scholasticism. The problem is to provide adequate and suitable channels for it. Conditions are rapidly changing, and educators must face the facts as they are.

The profound demand of this army of nearly three hundred thousand students in the United States to-day is for an education which will enable them to live most worthily and effectively the life of to-day and to-morrow. The demand,

<sup>1</sup>Original data not segregated.

## COLLEGE ATTENDANCE

which will not be denied, is for breadth of culture coupled with an effective bearing upon the needs and problems of life — a culture whose keynote shall be efficiency in action and service.

The problem of the educator is that of the correct interpretation and guidance of the social need.

The following table (III), comparing American and German attendance, also throws light upon this phase of the subject.

TABLE III

COMPARISON OF ATTENDANCE OF VARIOUS COURSES IN GERMANY AND THE UNITED STATES, 1905-1906

	UNITED STATES	GERMANY	RATIO U.S. G.
Population . . . . .	83,935,000	60,641,278	1.39
Theology . . . . .	7,968	3,846	2.07
Law . . . . .	15,411	12,456	1.22
Medicine . . . . .	21,924	6,142	4.05
(Incl. Dent. and Pharmacy) . . . . .	36,945		[6.01]
Philosophy or Liberal Arts . . . . .	91,200 <sup>2</sup>	19,494	4.83
Arch. and Civ. Engineering <sup>1</sup> . . . . .	10,200 <sup>2</sup>	5,413 <sup>3</sup>	1.86
Mechanical and Electrical Engineering <sup>1</sup> . . . . .	15,150 <sup>2</sup>	5,161	2.95
Chemical Technology . . . . .	1,120 <sup>2</sup>	1,431	1.00
Mining . . . . .	3,260 <sup>2</sup>	686	4.75
Agriculture . . . . .	5,000 <sup>2</sup>	1,517	3.3
Veterinary Medicine . . . . .	1,445	1,120	1.29

Data from Ascherson, Lexis, *Minerva*, and *Report of U. S. Commissioner of Education, 1906*.

In making this comparison, too definite conclusions must not be drawn, as there are marked differences in standards and curricula. Thus it is probable that quite one half of the American collegiate students are doing work of German gymnasial grade. In the technical and professional fields it is possible that the work is more nearly commensurate. Another item not indicated here is the much larger proportion of women students in the United States. However, this broad subject of comparison can only be touched upon and left with the statement that American standards are improving more rapidly than they are aware who have not been giving attention to the subject.

In both Germany and the United States, indications have not been lacking that the increase in attendance is shifting in direction. In Germany the Polytechnica do not appear to show a growth in recent years proportionate to that of the universities. For the year 1909-1910, only one American university (Stanford) shows any marked gain of engineering students over the preceding year. Other professional fields, noticeably medicine, appear to show a

<sup>1</sup> Not segregated in German data. In United States, 900 Arch., 9300 C. E. and 2700 General Eng.

<sup>2</sup> Computed on basis of returns for 86.5 per cent of total. See *Report of U. S. Commissioner of Education, 1906*, p. 416.

<sup>3</sup> In 1902 there were 1995 Arch. and 2852 C. E. On a proportionate division this gives in 1905-1906, 2220 Arch. and 3223 C. E.

## COLLEGE ATTENDANCE

similar check. On the other hand, the Commercial High Schools of Germany and the American departments of Commerce and Diplomacy show very significant beginnings.

The most recent statistics regarding the trend of university attendance in France are given in Table IV.

TABLE IV

DISTRIBUTION OF FRENCH STATE UNIVERSITY STUDENTS BY FACULTIES FOR SPECIFIED YEARS (FROM *Report of U. S. Commissioner of Education, 1909, Vol. I*).

FACULTIES	STUDENTS		
	1907 <sup>1</sup>	1908 <sup>2</sup>	1909 <sup>3</sup>
Law . . . . .	15,551	16,315	17,046
Medicine . . . . .	6,599	7,220	7,333
Sciences . . . . .	6,349	6,258	6,408
Letters . . . . .	5,710	6,201	6,216
Pharmacy . . . . .	1,735	1,574	1,510
Extra University Schools of Medicine and Pharmacy . . . . .	2,253	2,322	3,384
TOTAL . . . . .	38,197	39,890	41,897

Passing from the general aspect of the problem to certain effects brought in its train, it is significant to note the results wrought upon individual American institutions. For the purposes of this investigation five typical universities were selected. Geographically they form a chain across the continent, and in type they represent institutions resting upon private foundations, public foundations, and combined public and private foundations. They are Harvard, Cornell, Wisconsin, California, and Stanford. Charts of the numbers of regular students at each of these institutions, year by year, were plotted. The chart of attendance at Cornell is here given as being typical of all.

It is interesting to remark that each one of these institutions which was established before 1885 shows the same general trend of increase, as is shown by Curve B of Chart II, the curve of combined attendance at all higher American institutions of learning. Slight irregularities, due to local conditions, such as change of entrance requirements, etc., are, to be sure, to be observed. In common with Curve B they show the effect of the hard times following 1873 and 1893 in the form of a decided offset or sag. A similar effect may be expected in the years following 1907. It will be noted that the effect is a delayed rather than immediate one. Each chart shows a practically uniform attendance until about 1885, and then a sharp upward bend maintained with essential uniformity. It is remarkable that institutions differing widely in their nature and separated by thousands of miles geographically should experience simultaneously this thrill of rebirth. Who shall maintain that the growth of any single institution, beginning at this time, was due to

<sup>1</sup> *Report on the Budget — Service of Public Instruction, 1908*, by M. Maurice-Faure, p. 25.

<sup>2</sup> The same, 1909, by M. Maurice-Faure, p. 79.

## COLLEGE, COST OF INSTRUCTION

the direct action or influence of some particular individual or administration? This simultaneous action indicates a much more profound cause than this — an institution not to have been affected by this broad, fundamental movement must have definitely turned its back

Chart of regular students in attendance at Ithaca (exclusive of summer school, short courses, and the College of Medicine in New York).

upon the demand of the times and refused to open its gates to an awakening people.

Aside from its effect upon the curricula of the institutions, a subject worthy of careful study, this rapid growth has wrought profound changes upon the nature and composition of the teaching staffs.

G. H. M.

See COLLEGE GRADUATES, PROFESSIONAL DISTRIBUTION OF; UNIVERSITY GRADUATES, PROFESSIONAL DISTRIBUTION OF.

**COLLEGE AND UNIVERSITY, COST OF INSTRUCTION IN.**—See UNIVERSITY AND COLLEGE, COST OF INSTRUCTION IN.

**COLLEGE AND UNIVERSITY PHILANTHROPY.**—See PHILANTHROPY, EDUCATIONAL.

**COLLEGE AND UNIVERSITY PROPERTY.**—No accurate study up to the present time has been made of the values of the sites owned by colleges and universities, or of the equipment used for educational purposes, such as laboratory supplies, furniture, and apparatus. The data collected on this subject by the United States Bureau of Education and by other agencies do not form a basis for such a study. Figures for the values of these assets may be obtained from practically all educational institutions, but these figures as given are not comparable with any fair degree of accuracy. Reasons for this status may be briefly stated. First, with regard to the land used for building sites, campuses, and athletic parks: such real estate is not a business asset in the same sense as real estate held as investment. It is not productive of income. College treasurers have, therefore, not usually included the value of the educational plant, with additions and depreciations, in the balance sheet; they have given these items in a separate exhibit, and have set down nominal rather

## COLLEGE PROPERTY

than scientifically computed values. The explanation for this method is that in years past the purpose of college accounting has been historical rather than to assist in securing costs and in governing financial policy. Whether the plant was overvalued or undervalued was not significant. In some instances the stated value of such plants has not been changed in fifty years, though in the meantime a city has developed about the campus and the adjoining real estate increased many hundred per cent.

There is a marked tendency at this time for colleges and universities to adopt methods of accounts such as are now in use in our most highly developed business enterprises. As this conception comes into practice an earnest effort is being made to place true values on all tangible assets; with broad limits to change these values as conditions change, and to utilize all of these figures in estimating the cost of education and in adjusting educational policies. If, in the end, this plan is to succeed and we are to have values which are comparable, colleges and universities will need first of all to adopt certain definite bases of judgment which are practically permanent in nature. Such an effort is still in its first stages, but it seems to be proceeding along the following lines: (1) It is not considered a requisite of good accounting to change the figures of a piece of property every time the market seems to change, but it is important that these changes be made periodically, preferably at stated intervals of from one year to three or five years. Unless an effort is made to do this at given periods, revaluations are apt to occur only when imperative; they are left to chance. (2) In the matter of lands, college property seems to be divided into three general classes:

(a) Land, the value of which can be definitely determined from the values of surrounding property, irrespective of the existence of the college. Thus, the value of the site of Columbia University may be determined by the prevailing realty values of New York City property in its immediate vicinity. The influence of the college upon the value of the surrounding land is slight. (b) Land, the value of which is dependent both upon city realty value, irrespective of the existence of the college, and upon the influence which the college itself exerts upon the immediate land values. Thus, the land occupied by Harvard is desirable property as a residential district of easy access to Boston. But the existence of Harvard in Cambridge also probably holds Cambridge real estate at a higher cost than if Harvard were not there. (c) Land, the value of which is dependent chiefly upon the existence of the college itself. Princeton University and Hampden-Sidney are types of this class. If either of these institutions were removed, its site would be valuable only as vil-

lage property or as farm land. These variables cannot, of course, be sharply differentiated. They may prove helpful in determining a purchase price which should replace in accounting the original values fixed in some instances many years ago, or the nominal values as given frequently in other instances. It goes without saying that, if property is purchased in the open market, the purchase price should be considered the inventory value until changed conditions necessitate a revaluation. (3) The point of view should be the market value of the land with the supposition that the buildings are to be removed. (4) In inventorying buildings, replacement values should be used. The value of each building should be stated independently of a group of buildings.

According to the best available data, the value of college property among institutions which merit places of first rank ranges from about \$200,000 to about \$16,000,000. The property used for educational purposes of Franklin College is estimated at \$250,000; Washington and Lee University at \$360,000; Grinnell College at \$511,000; Beloit College at \$627,000; University of Minnesota at \$3,385,000; Columbia University (exclusive of Barnard College, Teachers College, and the College of Pharmacy) at \$15,581,000. The United States Commissioner of Education in 1907 collected data concerning property owned by state institutions. A scrutiny of the figures of this report reveal the fact that, however rough the estimates may have been, the basis of judgment as to the values must have varied widely.

**COLLEGE BOARDS IN EDUCATION, DENOMINATIONAL.** — State supervision of higher education in the United States, except in the state of New York, has been confined to tax-supported institutions. Without a conscious relation to the general system of education, a general multiplication of colleges has occurred and the exigencies of this situation are in part responsible for the creation of various denominational boards of education.

Before entering upon a description of the organization and work of these boards, it is worth while to state briefly the influences which have hitherto operated in bringing colleges into related groups, the connecting thread being a denominational one. The earliest educational foundations in the United States were established under the supervision of Christian churches. Thus, the relation between Harvard College and the established Congregational churches of the Colony of Massachusetts Bay was a close one, the ministers of certain towns long retaining seats upon the board of overseers. Similarly, Yale College was in direct relationship with the Congregational churches of Connecticut, the charter retaining for over one hundred years a provision for a certain number of Congregational divines as trustees; and when, during the middle of the eighteenth century, the president of Yale and several professors announced their intention to enter the Church of England, the announcement was, as a matter of course, accompanied by their resignation from the college faculty. King's College in New York City (now Columbia University) was established under the auspices of the Church of England, the Archbishop of Canterbury being the Visitor of the college, and Trinity Parish in New York providing the college with its first site. The Venerable Society for the Propagation of the Gospel occupied, until the Revolution, the position of patron of King's College, and assisted it frequently with funds. Princeton, notwithstanding an absence of charter control, is generally considered as distinctively a Presbyterian college as Rutgers was a Dutch Reformed; and in general it may be said that until well along in the nineteenth century, whether colleges were legally connected with a church or simply associated with a church in thought and service, almost every educational institution looked up to some one of the churches for fostering care and means of growth, and in return gave to that church the influence to be derived from the regulation of the form of worship in the college chapel and from the free use of the college pulpit. It may be remarked that the sundering of the legal charter ties in the cases of Harvard, Yale, and Columbia did not prevent those institutions from remaining in this relation of community of worship with the church by which they had formerly been controlled. It was not usual for a college to be established, like Leland Stanford Junior University, hospitable and receptive to all of the religious bodies to which its students belong, but on especially intimate terms with none. The extraordinary charter requirements of Girard College (*q.v.*) show how, in the period of its incorporation, it was thought almost necessary to accompany freedom from any form of ecclesiastical control with the denial of ordinary courtesies to ecclesiastics.

In the Roman Catholic institutions the connection with the church is as a rule maintained through the ownership of the entire property of the college or university by one of the religious orders. Thus the first Roman Catholic college in the United States was founded by the Jesuit Fathers when they secured a charter for Georgetown University; and at the present time this order and some of the other orders, particularly the Christian Brothers (*q.v.*), control a number of educational institutions, scattered over many states. It was not until 1899 that all of the Roman Catholic colleges were brought into intimate relationship with each other through the formation, by 53 colleges, under the guidance of the rector of the Catholic University of America, of an Association of Catholic Colleges of the United States (*q.v.*). The close union between the colleges of a Roman Catholic order is thus the first illustration of what has been for a considerable time the policy in several Protestant churches through their educational societies or college boards. The Association of Catholic Colleges in the United States is, on the other hand, rather a federation corresponding to the Ohio State Association of Colleges, or the Association of Colleges of the Middle States and Maryland, for it concerns itself with pedagogical questions and matters of intercollege comity more than with policies of college administration and economy. Partly out of the lack of unity among colleges of the same denomination grew the idea of a central board, which might have supervision, at least of a certain sort, over all the colleges and schools of a given denomination. Of these the more important are the Presbyterian College Board, the Board of Education of the Methodist Episcopal Church, the Board of Education of the Methodist Episcopal Church, South, the Congregational Education Society, and the Board of Education of the Reformed Church in America, of whose organization and educational policy brief descriptions follow.

*Presbyterian College Board.* — Organized in 1883 by the General Assembly of the Presbyterian Church in the United States of America, under the name of the Presbyterian Board of Aid for Colleges and Academies. In defining the purposes of this organization special emphasis was placed upon the wisdom of establishing colleges in sparsely settled and rapidly growing western states. This policy was to assist the missionary movement by training up the ministers and missionaries on the ground. The board as now constituted consists of 24 members, one half of whom shall be laymen, both ministers and laymen to be elected by the General Assembly. The principles under which the board will either aid colleges directly or endeavor to influence gifts to them are: (1) The college must require of all students before graduation a study of the Bible at least

equivalent during the entire course to 144 hours. (2) Every teacher in the college must be certified to the board as being of open Christian profession and possessing actual spiritual influence with students. (3) A college assisted or endowed by the board shall seek the conversion and the consecration of every student as its prime business. Coöperating with the board at this time are 51 colleges. The offices are at 156 Fifth Avenue, New York City.

*Board of Education of the Methodist Episcopal Church.* — Organized by a committee of the General Conference of 1864 to consider the disposition of moneys raised as educational funds. The board began its work with a fund of \$84,000, six sevenths of which had been contributed as a part of the Sunday School Children's Fund. In 1892 the General Conference made it the duty of every pastor to take an annual collection in his church for the fund and to forward it to the Board of Education. The money thus collected was to be used by the board for the relief of poor scholars and for the development of general educational interests. In this year, also, the Board of Education was ordered by the General Conference to apply certain regulations of the University Senate of the Conference in regard to college standards. The University Senate consists of 15 members, all of whom are presidents or heads of Methodist colleges or universities. The following resolution is significant of the work of the board: That while the University Senate is not yet ready to prescribe as an immediate requirement a measurably higher standard for the colleges on the official list, it is deemed best to advise all our institutions to move as speedily as possible to the following standard: (1) To the requirement of a full four-year preparatory course for entrance to the freshman class. (2) To the requirements of full four years of collegiate work as leading to the bachelor's degree — the course to include only such studies as properly belong in the college of liberal arts. (3) To the requirement of a faculty of not less than six professors, giving their time exclusively to collegiate as distinguished from preparatory work. (4) To the requirement of not less than 50 students regularly enrolled in the four college classes. (5) To the requirement of not less than \$200,000 as actual productive endowment as necessary to give an institution stability and to secure for it the confidence of its constituency.

*Board of Education of the Methodist Episcopal Church, South.* — Organized by the General Conference which met in Memphis, Tenn., in the spring of 1894. The aim of the board is, first, to promote the endowment of existing colleges which have the elements of success and the necessary conditions of usefulness; second, to repress the tendency to multiply institutions with inadequate prospects of support; third, to encourage the establishment of

academies which "are especially demanded by present educational conditions, and are easily within the reach of our means and should be placed in close correlation with such institutions of our church as the annual conference may direct." The fourth and final aim of the board was announced to be "to complete our system by correlating as rapidly as possible our conference colleges with the graduate and professional departments of Vanderbilt University." At the meeting of the board in 1896 steps were taken for securing complete statistics of the educational institutions of the Methodist Episcopal Church, South. A committee was also appointed "to report on the possibility of bringing about a uniform standard in our institutions and of correlating them." At the 1897 meeting special attention was given to the work of the teachers' bureau under the management of the board, and the secretary of the board was authorized to publish an educational quarterly. In 1898 the directors at their meeting paid much attention to education among the negroes under their supervision. In the last five years a number of important pieces of work have engaged the attention of the Board of Education. One of these has been the question of the classification of the educational institutions of the Methodist Episcopal Church, South, for which purpose the board now has a permanent committee. In 1907 the educational commission made a careful and comprehensive report on that subject, which has been adopted by the board. This report classifies the educational institutions of the church into three grades. The first is that of universities; and a university is defined as an institution having "a productive endowment of not less than a million dollars, and organized on a basis of professional schools and of elective studies, with departments of original research." Colleges constitute the second grade; and "in order to be classed as a college an institution must employ not less than seven professors, or adjunct professors, giving their entire time (at least fifteen hours a week) to college instruction. It shall have, exclusive of matriculation and tuition fees, a permanent annual income of five thousand dollars, which may arise from interest on endowment fund, conference assessments, private gifts, or net earnings from board or dormitories." There are two classes of colleges, Class A and Class B. In order to be admitted to Class A, a college must have an endowment fund (unless it is a college for women) of \$100,000, and since 1909-1910 must require 14 units for admission.

*Congregational Educational Society.* — On Dec. 4, 1816, there was incorporated in the city of Boston the American Society for the Education of Pious Youth for the Gospel Ministry. This organization was the result of a movement set on foot about six months before that date by a few young men who banded themselves together "to educate pious

young men for the ministry." The opening meeting of the society was held Dec. 7, 1816. On the occasion of this meeting need of trained ministers in the West and South was set forth. Within eleven months \$4000 were collected from the churches, and 40 young men "of hopeful piety" in Canada and the United States were being aided financially in their education. Three years later, on Jan. 31, 1820, the name of the society was changed to the American Education Society (*q.v.*). In the West a somewhat similar movement had been started, out of which grew the founding of Illinois College in Jacksonville. The new society, called the Western College Society, had no strong organization. It was not until June 29, 1843, that this society was formally launched as the Society for the Promotion of Collegiate and Theological Education. On Mar. 9, 1874, this second organization was united with the Boston society under the new name of the American College and Education Society. Until 1893 the work of the American College and Education Society was confined to collegiate and seminary education; but by an act of legislature of Mar. 25, 1893, its scope was enlarged to include preparatory training, and its name was changed to the American Education Society (*q.v.*). The need for academies which should give good college preparatory courses was felt in the West and Southwest, where secondary education was especially weak, and within three years the society was aiding "a score of academies from twelve different states and territories." In September of the same year the society consolidated with the New West Education Commission, an organization incorporated in Chicago in 1879, whose object was "the promotion of Christian civilization in Utah and New Mexico . . . through the agency of Christian schools." The consolidation added mission school work to the already large scope of the society. On Mar. 9, 1894, the name of the society was again changed, this time to the Congregational Education Society, the title which it bears to-day. Its object, as finally set forth in the constitution adopted Apr. 11, 1904, is "the promotion of Christian Education by assisting needy young men of piety and ability in acquiring an education for the gospel ministry; by aiding collegiate and theological institutions, academies, and other schools in which children and youth are trained under Christian teachers." By an act of legislature approved Feb. 25, 1907, and adopted by the corporation June 12, 1907, the powers of the society were enlarged by the authority "to promote Christian civilization in any territory or country acquired or hereafter acquired by the United States . . . and in foreign countries, by endowing, assisting, or establishing academic, collegiate, or theological institutions of learning therein, and by . . . aiding indigent children and young persons . . . seeking an education in such institutions." Up to 1906 the

## COLLÈGE BOURGET

society had made large contributions in all branches of its work. More than \$2,457,113 had been given to 30 colleges and seminaries in the ninety years of its existence — an average of over \$27,300 a year; \$354,124 had been donated, within fourteen years, to academies, making here an annual average of \$25,316; \$887,964 had been contributed toward the mission schools since the beginning of the New West Education Commission. According to a statement published in 1906 by the society itself, the total for all its departments from their respective beginnings until that year was \$5,541,209.

*Board of Education of the Reformed Church in America.* — In 1812 the General Synod of the Reformed Church in America ordered that collections be taken up in the churches for the sustenance of needy students for the ministry. The copyright of the *Psalms and Hymn Book* was also secured to the synod for this purpose, and several bequests were received from members of the church. But the sum available continued small, and in 1828 a number of ministers and other friends of education met in the lecture room of the Collegiate Church in New York City, to consider the propriety of organizing a board of education. As a result of this meeting a board of education was organized, with Colonel Henry Rutgers as president. The amount granted to a beneficiary was at first limited to \$90 a year, being designed to aid a student rather than sustain him fully. During the first year of its operation the board, with its auxiliary societies, assisted about twenty students. In 1831 this education society, to which donations began to be left, requested the general synod to take charge of it as the synod's own board. Accordingly, in 1832, the synod constituted a new board, with the same officers as the former board, and the funds of the old board were turned over to the care of the synod. The board was incorporated in 1869, and since then it has retained in its own hands the scholarship funds entrusted to its care. These now amount to \$127,000. Before the organization of the board as a corporation the funds collected for this purpose were held either by the general synod itself or by Rutgers College. The total amount of the several funds is now about \$100,000.

**COLLÈGE BOURGET, RIGAUD DE VAUREUIL, QUEBEC.** — A school for boys founded in 1850 and conducted by the Clerks of Saint-Viateur. Preparatory, classical, and commercial departments are maintained. There is a faculty of 15 professors in the classical department.

**COLLEGE, CERTIFICATE SYSTEM OF ADMISSION TO.** — See ACCREDITED SCHOOLS; COLLEGE REQUIREMENTS FOR ADMISSION; COLLEGE EXAMINATION AND CERTIFICATION BOARDS; HIGH SCHOOL AND COLLEGE, PLACE OF.

## COLLEGE EXAMINATION BOARDS

**COLLEGE, COEDUCATION IN.** — See COEDUCATION; WOMEN, HIGHER EDUCATION OF.

**COLLEGE CURRICULUM, ADMINISTRATION OF AND TYPES OF.** — See COLLEGE, AMERICAN, p. 66, seq.

**COLLEGE DEGREES.** — See DEGREES.

**COLLEGE DISCIPLINE.** — See STUDENT LIFE; COLLEGE, AMERICAN.

**COLLEGE, ENGLISH.** — The distinction between those colleges which only offer secondary school work and those which give courses leading to university degrees is so well marked in England that it is not necessary to give separate treatment to those institutions which bear that title. In the article on COLLEGE it has been pointed out that many schools which call themselves colleges have no right to that title, but have adopted it in imitation of the older and more famous institutions such as Eton College (*q.v.*), Winchester College (*q.v.*), etc. Representative lists of colleges of secondary school grade will be found under GRAMMAR SCHOOLS, ENGLISH; see also, ENGLAND, EDUCATION IN; PUBLIC SCHOOLS. Those Colleges which are constituent parts of the universities are given under CAMBRIDGE UNIVERSITY; LONDON, UNIVERSITY OF; IRELAND, NATIONAL UNIVERSITY OF; OXFORD UNIVERSITY.

**COLLEGE ENTRANCE REQUIREMENTS.** — See COLLEGE REQUIREMENTS FOR ADMISSION.

**COLLEGE EXAMINATION AND CERTIFICATION BOARDS.** — During the past thirty years various associations of colleges and of preparatory schools have been formed for the purpose of perfecting the relation between the high school and the college. These organizations have sought to establish (1) a fair degree of flexibility in high school curricula and in college entrance requirements; (2) uniformity in the standards of high schools and in the requirements of the colleges; (3) adequate and uniform administration of policies agreed upon. With these common interests, small groups of college and high school teachers have united for the betterment of local conditions. Progress along these lines from a national point of view is of comparatively recent date. The first notable effort toward a uniform standard in college requirements grew out of a conference of New England colleges held at Trinity College, in December, 1879. At the conference a comparison was made of college catalogues and of college examination papers. President Eliot describes the finding in his *Report for 1886-1887*, page 5: "Some colleges demanded no English at entrance; others required the candidate to write a short composition, but gave no hint as to what the subject might be; others

called for a knowledge of formal grammar and nothing else; others for both grammar and composition. Some of the examination papers asked questions which could not be fully answered without a minute knowledge of prescribed texts, or of difficult points in grammar; others asked questions suited to the capacity of grammar school, or even primary school, pupils." This conference led to the adoption by the New England colleges, with the exception of Yale, of a uniform requirement in English. The English requirements which were then in force at Harvard were accepted. In the next three years a similar uniformity in stated requirements for the classics and for mathematics was accomplished for New England. The fair degree of uniformity thus put into practice stimulated the formation of permanent organizations of secondary schools and colleges. At the meeting of the Massachusetts Classical and High School Teachers' Association in 1884, the secretary of the association was requested by vote to propose to the heads of the New England colleges a conference with preparatory school teachers. Out of this effort grew the first organization of the kind, the New England Association of Colleges and Preparatory Schools. The object of the association was stated to "be the advancement of the cause of liberal education by the promotion of interests common to colleges and preparatory schools." The membership of the association was open to all colleges and preparatory schools within the territory, irrespective of educational standard or number of courses. Seventy-three colleges and preparatory schools are enrolled as members.

In 1887 representatives of 15 colleges in the state of Pennsylvania met at Franklin and Marshall College, and formed themselves into an association to be called the College Association of Pennsylvania. The next year the scope of the association was extended and the name changed to the Association of Colleges and Preparatory Schools in the Middle States and Maryland. The object, among other things, has been from the first "to consider the qualification for candidates for admission to the colleges and the methods of admission." Any college, normal school, or other school preparing students for college may be received into membership.

The Association of Colleges and Preparatory Schools of the Southern states was organized in the autumn of 1895 at Atlanta, Ga., at a meeting of delegates from a number of southern colleges and universities. The purpose of the meeting as stated was, first, to organize southern schools and colleges for cooperation and mutual benefit; second, to elevate the standard of scholarship and to effect uniformity of entrance requirements; and, third, to develop preparatory schools and cut off this work from the colleges. This association has taken definite steps toward promoting uniform standards of entrance; and regulations touching upon the amount of work to be required and the administration of these

requirements are made conditions for membership in the association. The roll of members of the association includes 19 colleges and universities, and 30 schools.

The North Central Association of Colleges and Secondary Schools was organized in 1892 for the purpose of establishing closer relations between the colleges and secondary schools of the North Central states. The membership of the association comprises, first, colleges, universities, and secondary schools; second, individuals identified with educational work within the limits of the association. No college or university is eligible for membership whose requirements for admission represent less than 15 units of secondary work, nor which confers the degree of Doctor of Philosophy or Doctor of Science except after a period of three years of graduate study, not less than two of which must be years of resident study, at least one year of resident study to be spent at the institution conferring the degree. This association includes Ohio, Michigan, Indiana, Illinois, Wisconsin, Iowa, Missouri, Nebraska, Kansas, Colorado, and Oklahoma.

The associations just described have been the important organizations of a local nature whose chief object has been promotion of better understanding and cooperation between secondary schools and colleges. In addition to these organizations, there are a number of state college associations which exist primarily to safeguard the standards of higher education. They are in reality protective associations against sham colleges. Such organizations are especially active in Ohio and Missouri. In the state of Iowa there exists an exceptional plan for the regulation of collegiate instruction which may be compared with the University of the State of New York. The General Assembly created a board of educational examiners, composed of the State Superintendent of Instruction, the president of the state university, the president of the state normal school, and two men appointed by the Governor. This board under the power vested in it has grouped the colleges of the state into three classes. A system of "points" is defined and the colleges are divided according to the number of points that they are able to meet. The points and the methods of grouping the colleges are as follows:—

(1) The number of class hours for the heads of departments and students shall not exceed twenty a week. (2) A faculty properly qualified shall consist of graduates of colleges who have pursued graduate work equivalent at least to that required for a master's degree. (3) The library shall consist of at least five thousand volumes, selected with reference to college subjects and exclusive of public documents. (4) The laboratory equipment shall be worth not less than \$5000 and so distributed as to establish at least an efficient chemical, physical, botanical, and zoological laboratory. (5) The means of support is defined as requiring a permanent endowment of not less than \$200,000 or a fixed assured income equivalent to the interest derived from at least \$200,000. (6) The average salary of heads of departments, exclusive of the salary of the president, shall be at least \$1000.

(7) The college must maintain at least seven separate departments or chairs, and in case the pedagogical work of the institution is to be accepted without examination, the college must maintain at least eight chairs, one of which shall be devoted exclusively to education or at most to philosophy, including psychology and education. The heads of these departments should be devoted to college work. (8) The graduates must show the completion of a four-year secondary course and a four-year college course above the usual eight grades of common schools, and the standing and character of the institution and the nature of its equipment and work must be such as to entitle its graduates to admission to the graduate college of the State University of Iowa.

In the state of New York the degree-granting power of colleges and universities is under the control of the Regents of the University of the State of New York (*q.v.*). This board has outlined a system of "counts," and institutions of higher learning in the state must require for admission 70 counts if they are to grant college degrees. In other words, by legislative power the colleges and universities of New York are based upon a four-year high school system.

All of the associations just enumerated have exerted an important influence in their respective territories toward uniformity and toward sincerity in college work. Each association has restricted its membership on geographical lines; and each has developed with little reference to educational conditions outside of its own boundaries. The combined efforts of these movements, however, have prepared the way for a national adaptation of certain practices which they have encouraged or demanded. Such a development, inevitable in view of the many local forces at work on the same problems, found its first expression in the report of the Committee of Ten which was appointed by the National Educational Association in 1892. This committee was appointed to formulate plans looking to a greater degree of uniformity in admission requirements. In approaching the problem the committee turned its attention to the details of the courses of secondary schools, and its report gave a tremendous impetus toward uniform secondary education. It was the sense of the committee that the colleges should adapt their requirements to the secondary schools after these schools had been put upon a sound educational basis. With uniformity in the secondary schools, uniformity in college entrance requirements would follow as a natural sequence. The methods of adjustment between the colleges and secondary schools were left for each college or association of colleges to solve.

In 1895 the Committee on College Entrance Requirements was appointed by the National Education Association to investigate existing entrance conditions and to report upon ways and means of securing uniformity. The final report of this committee, which was in preparation for four years, was presented in 1899. The conclusions rising out of the investigation

were set forth in fourteen resolutions. These resolutions furnished a feasible means of securing uniformity as well as elasticity in the requirements. The report was the first step, national in character, toward bringing the high schools and colleges throughout the country into harmonious cooperation.

The practical administration of uniform entrance regulations, even after such regulations had been adopted, was still to be accomplished, and in a large measure is still to be accomplished. Uniformity in theory without uniformity in practice not only leaves the problem unsolved, but is one of the chief causes of the separation of our educational system into unrelated parts. More than any other one thing it has given rise to a lack of confidence in the colleges among high school teachers. Different interpretations of a uniform requirement may each be made with sincerity; but from the point of view of the secondary school the fairness and the sincerity are not always evident. The difference in interpretation is frequently so great that the requirements, uniform in theory, are in practice radically unlike. The desire that the various educational associations should consider their problems national rather than sectional resulted in the formation in 1906 of the National Conference Committee on Standards of Colleges and Secondary Schools. This committee is a means by which each association represented in it keeps in touch with the problems and progress of the various associations. The committee is composed of delegates from the following organizations:—

The New England Association of Colleges and Preparatory Schools.

The New England College Entrance Certificate Board.

The Association of Colleges and Preparatory Schools of the Middle States and Maryland.

The College Entrance Examination Board.

The North Central Association of Colleges and Secondary Schools.

The Association of Colleges and Preparatory Schools of the Southern States.

The National Association of State Universities.

The Carnegie Foundation for the Advancement of Teaching.

The United States Commissioner of Education, *ex officio*.

The most effective agency working toward uniformity in administration of entrance requirements is the College Entrance Examination Board. This board not only publishes from time to time a statement of the ground which should be covered and of the aims which should be sought by secondary teaching, but it arranges for a uniform and impartial marking of all examination papers. The following subjects as taught in secondary schools come within the scope of the board: botany, chemistry, drawing, English, French, geography, German, Greek, history, Latin, mathematics, physics, Spanish, and zoology. The board has in the past seven years provided a means for a fair and trustworthy uniformity of entrance

## COLLEGE FOR WOMEN

terms among the institutions which make up its membership. This membership extends west as far as Cleveland, and south as far as Baltimore.

Another organization which should be here included is the Association of Collegiate Alumnae, formed in 1882 for "practical educational work." The association has 36 branches, with an enrollment of about 3800 members. These branches interest themselves in their local educational needs, such as the betterment of state legislation for education, and the closer coöperation between schools and libraries. But the main effort of the association has been to increase the desire among girls for college training, and to keep the educational standard of colleges for women on the same plane as that of the colleges for men. There are 24 colleges and universities whose non-professional degrees admit to membership.

In May, 1902, delegates from nine New England colleges met at Boston and organized the New England College Entrance Certificate Board. The purpose of the board, as stated, is "receiving, examining, and acting upon all applications of schools that should ask for the privilege of certification." The organization is an effort to perfect uniformity in accepting secondary school certificates, and differs in its purpose from the College Entrance Examination Board in that the one aims at uniformity in the accrediting plan, the other at uniformity by means of examinations. For discussion of the function of these Boards and work accomplished by them, see COLLEGE REQUIREMENTS FOR ADMISSION.

J. G. B.

**COLLEGE FOR WOMEN, COLUMBIA, S. C.**—A Presbyterian College for women. Collegiate, musical, fine arts, and commercial courses are given. The work of the college leading to the degrees of Bachelor of Arts and Bachelor of Science is based on approximately twelve points of high school work. The faculty includes 24 instructors.

**COLLEGE GRADUATES, PROFESSIONAL DISTRIBUTION OF.**—The constantly changing function of the American college in preparing students for professional work is well illustrated by the professional distribution of the graduates of Harvard College. (This article leaves out of consideration the professional schools of universities included in this discussion, and treats only the collegiate departments of those universities.)

**Harvard.**—The distribution for the collegiate department of Harvard is as follows.

**Ministry.**—The ministry during the early years of Harvard's history was the dominant profession. Not until Harvard had graduated students for a century did any other profession claim as many of its graduates; indeed, so great was this dominance that the institution during this time may with considerable propriety be

## COLLEGE GRADUATES

considered a theological training school. The curve representing this profession has three distinct tendencies. (1) 1642-1720. During this period the tendency is slightly downward, but with wide variations. Seventy per cent of the graduates of the first three years entered the ministry, a percentage never again equaled in the history of the institution. During the later years of this first period, the central tendency of the curve is approximately 57 per cent. (2) 1720-1775. Here the downward tendency is much sharper, with a decline from 60 per cent to less than 20 per cent, and the variations during this period are much less marked. (3) 1775-1905. This period shows a long-continued persistent decline. In 1841-1845 the profession for the first time took less than 10 per cent of the graduates, but after 1850 no five-year period took more than 10 per cent. The average for the profession since 1875 is less than 5 per cent, and only 2.2 per cent of the graduates of the years 1901, 1902, 1904, and 1905, entered the ministry.

The following table, which gives the absolute rather than the relative numbers entering the profession, affords an additional viewpoint:—

YEARS	TOTAL NUMBER GRADUATES COLLEGIATE DEPARTMENT	TOTAL NUMBER MINISTERS
1651-1700 .	401	232
1701-1750 .	1184	527
1751-1800 .	1880	471
1801-1850 .	2834	411
1851-1900 .	9052	480

It will be noted that the ministry took more graduates between 1700 and 1750 than during any subsequent fifty-year period, although there has been an eightfold increase in the total number of graduates from the collegiate department. In other words, the profession has scarcely held its own in absolute numbers, while the total number of graduates has been increasing enormously. It is also true that the absolute numbers entering other professions has been increasing very rapidly. The remarkable decline in the ministry is further illustrated by the fact that the curve for this profession starts with a far higher percentage than that for any other profession, but is gradually outstripped by each of the leading professions in succession, and is at present the lowest of all.

**Law.**—The development of the legal profession at Harvard may well be described by dividing it into four periods. (1) 1642-1685. Practically nil. There were only two lawyers during the period. (2) 1685-1780. The percentage at no time exceeded 15 per cent. (3) 1780-1880. During this time law was the dominant profession at Harvard, and with some exceptions took approximately a third of the graduates. (4) 1880-1905. During this period a declining tendency is apparent, with

an average percentage of 21.5 per cent. Law is exceeded by business pursuits.

*Medicine.* — During the first century the curve representing the profession of medicine is variable, reaching during this period both its maximum and minimum points. These are 25.9 per cent for 1671-1675 and 1.6 per cent for 1711-1715 respectively. Three five-year periods have a percentage greater than 10 per cent, and six five-year periods have a percentage less than five per cent. The next 100 years varies less and has a slightly higher average than either the preceding or the subsequent period. Eleven of the five-year periods have percentages between 10 and 15 per cent, and nine of them between 15 and 20 per cent. Since 1850 the central tendency for this profession has been about 11 per cent.

before 1700, and for these the percentages are small. Between 1700 and 1850 the median for this group is 8.9 per cent, and two thirds of the periods vary from it by less than 3.5 per cent. The prominent periods during this 150 years are 1720 to 1735 and 1791 to 1795, and the periods with the most conspicuous depressions are 1710 to 1720 and 1795 to 1845. Since 1850 there has been a general upward tendency, reaching the maximum percentage of 32.3 per cent in 1901-1905. Since 1880 it has been the dominant profession. The financial depressions of 1837, 1873, and 1893 are indicated by declines in the curves for those periods.

*Minor Professions.* — Engineering has never attracted very many of Harvard's graduates, but since 1820 has taken at least a small percentage

Professional Distribution of Graduates of Harvard College from 1642 to 1905.

*Teaching.* — Before 1685 the tendency for this profession is quite variable, with a central tendency of about nine per cent. For the next 165 years the central tendency (median) is 6.5 per cent, with only eight five-year groups out of the 33 included in this period varying from it by more than two per cent. After 1850 a rise is apparent which tends to increase toward the latter end of the century. Between 1850 and 1875 the average percentage is 10.9 per cent, while between 1875 and 1900 it is 16.8 per cent. The maximum for this half century, found in the period 1891-1895 is 20.4 per cent, or over one fifth of the graduates, and is greater than that of any other profession except that of commercial pursuits.

*Commercial Pursuits.* — This group had representatives in only six of the five-year periods

from each five-year period. This varies between  $\frac{1}{10}$  of one per cent and 3.9 per cent, and presents no striking characteristics or tendencies. Agricultural pursuits have always taken a few graduates, and the group seems to be as large at the present time as ever. Many five-year periods previous to 1800 show no representative in this group. The periods having representatives vary between 3.7 per cent and  $\frac{6}{10}$  of one per cent, with the exception of the first period, 1642-1645, which had one farmer out of a total of 14 graduates, or a percentage of five per cent. Literature and journalism have been represented in every five-year period since 1800, with a percentage varying from  $\frac{6}{10}$  of one per cent to 5.3 per cent, with a slightly larger central tendency since 1870 than between 1800 and 1870. A

small group is classified under "public service." This classification was used, however, only for those persons who could not be classified under some other profession, such as law. It is not, therefore, particularly instructive. Since 1800 this group had an average of approximately three per cent. Before that time the percentage was somewhat larger, because formerly many more persons went into public life without having preceded it by some other profession.

sions in the collegiate department at Harvard with the same professions in other leading institutions gives the following results.

*Ministry.* — The curves for ministry at Harvard and Yale are very similar previous to the Revolution, while that for Princeton is about 10 per cent higher than either during the period between its founding and the war. Columbia University and the University of Pennsylvania had relatively small percentages during this

Professional Distribution of the Graduates of Thirty-seven Selected Colleges from 1660 to 1900.

The total number of graduates who have entered each profession is shown by the following table:—

Law . . . . .	4117 graduates
Commercial pursuits . . . . .	3957 graduates
Ministry . . . . .	2203 graduates
Education . . . . .	2144 graduates
Medicine . . . . .	1958 graduates
Public service . . . . .	464 graduates
Literature and Journalism . . . . .	453 graduates
Engineering . . . . .	279 graduates
Agriculture . . . . .	223 graduates

A somewhat different analysis of the professional distribution of Harvard graduates arrives at practically the same results. The *Alumnus* Directory of 1910, containing the names of 32,192 living graduates, distributed them as follows:—

Law . . . . .	5300
Education . . . . .	3554
Medicine . . . . .	3337
Commercial pursuits . . . . .	3598
Ministry . . . . .	1000
Literature . . . . .	945
Engineering . . . . .	944
Public service . . . . .	529
Agriculture . . . . .	574

**Comparison of Harvard with Other Institutions.** — A comparison of the leading profes-

period. During the first half of the nineteenth century the curve for Yale averages about 10 per cent higher than that for Harvard. The curve for Columbia does not differ greatly from that of Harvard during this half century, but the curve for the University of Pennsylvania rises successively above Columbia, Harvard, and Princeton, and by 1850 surpassed Yale. It then took slightly over one fourth of the graduates of the university. The curves for Harvard and Yale converge after 1850, and at the close of the century are both at about five per cent. Princeton's curve after 1850 is higher than that of Harvard, Yale, Columbia, and the University of Pennsylvania, having an average nearly 10 per cent higher than that of Harvard. The University of Pennsylvania held second place during this half century. Yale held third place between 1850 and 1875, while Columbia has held it since that time. The curve for Harvard was the lowest throughout this period. All show the same marked tendency to decline. The curves for Dartmouth, Brown, Union, Williams, and the University of Vermont are somewhat higher than those for the five institutions described above

from the time of their founding to the middle of the nineteenth century. During the last half century there is little appreciable difference between the two groups. A third group, including Middlebury, New York, Beloit, and Wabash, averages about 28 per cent for the first half of the nineteenth century, as compared with 20 per cent for the second group and 17 per cent for the first group. The curves of this third group are also higher during the last half of the century. A fourth group, in which denominational influence has been considerable, includes Oberlin, Syracuse, Haverford, Northwestern, and Rochester. The curves for this group are more variable than those for the preceding groups, but are not as a whole higher than those of many institutions in which denominational influence is not so strong. A fifth group, consisting of state institutions, including Michigan, Wisconsin, Minnesota, California, and Illinois, shows that state institutions have not contributed largely to the profession of the ministry. The curves for this group are on the whole lower than any of those in the preceding groups.

*Law.* — The curve for law at Harvard runs lower than that for Yale during the latter part of the eighteenth century. Between 1800 and 1865 they are very similar. After that time Yale's curve runs somewhat higher than that of Harvard, though at the end of the century neither is far from 20 per cent. The law curve at Columbia is not very dissimilar to those of Harvard and Yale, until after 1860. It then runs considerably higher than either of them, and at the close of the century is higher than any other of the twenty-five institutions included in this comparison of professions. The curve for law at the University of Pennsylvania is more variable than those of Harvard, Yale, and Columbia. During the later years it is lower than any of these. The law curve at Princeton does not differ greatly from those of Harvard and Yale during the early part of its history. After 1850 it shows a sharp rise, but then declines even more rapidly, and is lower at the end of the century than those of Harvard, Yale, and Columbia. Group II (cf. above) is not homogeneous. Dartmouth and Union do not differ greatly from Group I. The University of Vermont is higher than Group I until after 1860, and lower than any of these at the close of the century. Brown's curve is on the whole about 10 per cent lower than any of Group I, and Williams' curve is lower than Brown's previous to 1860, but at the close of the century has about the same percentage as that for Harvard. The average of the curves of the third group does not differ greatly from that of the curves of the first group, but the decline is more rapid in the third, and at the close of the century its curves are decidedly lower. The curves for the fourth group, which includes institutions of denominational tendencies, are lower than those of any of the other

four groups. The fifth group, *i.e.* state universities, is not strikingly different from the other groups. The curves are somewhat lower than those of Group I for the same period, and decline more rapidly. They are higher, however, than those of Group IV, but do not differ materially from the curves of Groups II and III.

*Medicine.* — The curves for medicine for Harvard and Yale are very similar throughout their entire course. Princeton's curve is at first somewhat lower, but during the last half of the nineteenth century its average is approximately that of Harvard and Yale. Columbia's curve runs a little lower than those of Harvard, Yale, and Princeton. The curve for Pennsylvania is more variable than that of any other institution in this group. Its general average between 1820 and 1870 is higher than that of the other institutions, but after that date is somewhat lower than the average for Harvard, Yale, and Princeton. The general average of the second group is not quite so high as that of the first group during the first half of the nineteenth century. The curves for this group are also somewhat more constant in their variation about a central tendency of 10 per cent after the middle of the century. The curves for Group III, particularly during the last half of the nineteenth century, are more variable than those of Groups I and II, and their general average is a little lower. The fourth group is slightly lower than the preceding group, and accordingly perceptibly lower than the first two groups. Haverford is, however, a conspicuous exception to this between 1836 and 1870. For a time medicine took nearly 25 per cent of the graduates, but declined to about 10 per cent by 1870, and since 1880 has taken only about four per cent. The group of state institutions shows a general average which is a little higher than that of the denominational institutions of Group IV, but lower than that of the other groups.

*Education.* — During the eighteenth century Yale's curve for education averages from two to three per cent lower than that of Harvard, and the curves for Columbia, Princeton, and Pennsylvania do not differ greatly from that of Yale, though they are somewhat more variable. During the nineteenth century the curves for Harvard, Yale, and Princeton rise from an average of about three per cent to about 13 per cent in 1840. Pennsylvania and Columbia show a somewhat similar but more rapid rise. After 1840 there was a temporary decline in all of these institutions, but from 1860 to 1900 the rise in each is rapid. After 1860 the curve for Harvard leads the group. The rise at Columbia after this date is very marked. Previous to 1860 its average was the lowest in the group, whereas at the close of the century it was exceeded only by the curve for Harvard, and this exceeds it by only two per cent. The average percentage of the institutions in the second

group is higher than that of the institutions in the first, as shown by the fact that during the nineteenth century the general average for the second group rose from six per cent to 16 per cent, as compared with a rise from three per cent to 13 per cent for the first group. The third group is less homogeneous than the first two groups, but its average is higher. During the latter part of the nineteenth century this group rises much more rapidly than the two preceding groups. The fourth group, including denominational institutions, is even less homogeneous than the third group, and in turn is higher than any of the preceding groups. Its rise during the last few years of the nineteenth century is not as conspicuous as that of the third group. The state institutions show a more rapid and continuous rise than any curves of the other groups. Michigan, Wisconsin, and Minnesota each show percentages above 45 per cent at the close of the century.

*Commercial Pursuits.* — During the first third of the eighteenth century commercial pursuits show a rapid tendency to rise at both Harvard and Yale, culminating in 18 per cent for the former and 15 per cent for the latter. During the remainder of the century their curves are very similar, and the central tendency is approximately 12.5 per cent. Columbia, Pennsylvania, and Princeton, after their appearance at about the middle of the century, show much lower tendencies. During the nineteenth century, the general tendency of all the curves in the first group is to rise from about 10 per cent to approximately 30 per cent. All indicate the panics of 1837, 1873, and 1893 by depressions in their curves for those periods. During the first third of the century Harvard's curve is lower than any of the others, but rises to 28 per cent by 1865, and from this time until 1890 it is the highest curve. It is then exceeded by the curves for Yale and Princeton. Columbia's curve is the highest between 1810 and 1855, but at the close of the century is lower than any of the others. There are no striking differences in the first two groups, although the curves of the first group are a little lower than those of the second at the close of the century. The older institutions of the first group also seem to have been less affected by the financial depressions of the century. The curves for the third group are more variable. They rise more rapidly during prosperous business periods, and respond much more quickly to business depressions. The denominational institutions of the fourth group show the greatest diversity. Two of them, Northwestern and Rochester, unlike all others, show a general declining tendency, while Haverford has a higher average percentage than any other of the institutions in any of the groups. The state institutions show the greatest uniformity. They start with low percentages and rise rapidly until about 1880, and then

decline until the close of the century. Their maxima vary from 16 per cent to 21.5 per cent, and at the close of the century their percentages vary from 7.5 per cent to 13 per cent.

**Combined Statistics for Thirty-seven Representative Institutions.** — The accompanying chart (p. 92) gives graphically the statistics for the collegiate departments of the following representative institutions: —

1. Harvard	13. Vermont	25. Bucknell
2. Yale	14. Bowdoin	26. Beloit
3. Princeton	15. Colgate	27. Syracuse
4. Pennsylvania	16. Miami	28. Rochester
5. Columbia	17. Hanover	29. Wisconsin
6. Brown	18. Wesleyan	30. Northwestern
7. Dartmouth	19. New York	31. Chicago
8. Dickinson	20. Wabash	32. California
9. Williams	21. Haverford	33. Minnesota
10. Union	22. Oberlin	34. Nebraska
11. Middlebury	23. De Pauw	35. Vanderbilt
12. Washington and Jefferson	24. Michigan	36. Colorado
		37. Pomona

The results may be summarized very briefly as follows: —

*Ministry.* — Ministry starts with 70 per cent, and does not decline conspicuously until after 1720. Between 1720 and 1780 the decline is more marked than at any other time. A slight rise is found between 1780 and 1840, with a maximum percentage of 32.3 per cent. Since that time it has steadily declined, and at the close of the century has a percentage of 5.9 per cent. From 1642 to 1840 it was the dominant profession, with one exception, namely, the period 1780 to 1820, when it was exceeded by law. At the close of the century it is surpassed by teaching, commercial pursuits, law, and medicine.

*Law.* — At no time previous to 1750 does law have a percentage greater than 10 per cent. After 1750 it shows a tendency to rise, and takes about a third of the graduates at the close of the century. This is the maximum percentage for the whole history of the profession of law. During the nineteenth century it declined, with one exception, the decade 1865 to 1875, which was due to the increased stimulus to enter law because of the founding of law schools during this period. The increase was temporary, however, and by the close of the century law took only about 15 per cent of the graduates and was surpassed by both teaching and commercial pursuits.

*Medicine.* — In spite of the fact that the curve for medicine was extremely variable during the earlier years represented on the chart, it may be said that medicine has been the most constant of all the professions among college graduates. The conspicuous variations during the first period occur when there was no college but Harvard. The relative constancy of the curve is shown by the fact that between 1750 and 1895 no five-year period has less than 7.2 per cent or more than 13.4 per cent, and the general average is between 9 per cent and 10 per cent.

*Teaching.*— Previous to 1700, the curve for teaching represents Harvard only, and varies from 20.5 per cent. During the eighteenth century it varies but little from five per cent. By 1850 this had risen to 10 per cent, by 1875 to 13 per cent, and by 1900 to 26.7 per cent. Within one hundred years, therefore, the profession rose from a position taking about one twentieth to one taking about one fourth of the graduates. Previous to 1875 teaching was surpassed by ministry, law, and medicine, but after this time it exceeds medicine. Since 1880 it has been higher than ministry, since 1890 higher than law, and at the close of the century is the dominant profession, with commercial pursuits as its closest competitor.

*Commercial Pursuits.*— While this group scarcely appears before 1700, during the next century the curve representing it has an average percentage of approximately 9.5 per cent. During the first quarter of the nineteenth century, however, the general average fell to 6 per cent. From that time until the present the curve has risen steadily, and at the close of the century represents one fifth of the graduates and is exceeded only by that for teaching. It will be noted that the financial panics of 1873 and 1893 are strongly emphasized by depressions in the curves for this group.

*Minor Professions.*— The curve for engineering does not appear until after 1825. Its rise from that time until the end of the century is steady but never rapid, and at no point does the curve reach as high as 5 per cent. Farming has never attracted many college graduates. The maximum percentage is 3.9 per cent, and since 1700 the percentage has been greater than one per cent in all of the five-year periods except five. Three of these are the last periods in the nineteenth century. Previous to 1830 literature and journalism did not take more than one per cent of the graduates. Between 1830 and 1855 the percentage rose from one per cent to two per cent, and by 1885 reached its maximum, 3.3 per cent.

COLLEGE PROFESSORS, SALARIES OF. — United States. — Considering as a group the hundred colleges and universities which are strongest financially, statistics show that the

college teacher who has received his bachelors' degree, taken a post-graduate course, and prepared himself for the profession of teaching, may hope to obtain at the age of 28 a salary of \$1250, at 31 a salary of \$1750, at 33 a salary of \$2250, and at 35 — at which age the able man will have gained his professorship — a salary of \$2500. If we consider all of the institutions in the United States which are legally entitled to call themselves colleges or universities, the average salary of the professor is not more than \$1000 a year. The majority of these institutions, however, are colleges only in name; they are academies, and combinations of the academy and the college.

Before discussing the actual salaries paid to college teachers, it is important to remember that no man is likely to choose an academic life for the love of gain, or from considerations of material advancement. The great majority of college teachers consider but slightly the financial returns of their profession on a competitive basis with other professions. The attraction which leads able men into the teacher's calling springs from two sources — first the sense of power and responsibility which the true teacher feels; second, the love of study and of the scholar's life. Institutions of higher learning, whether they devote themselves to religion, technology, or literature, maintain honestly that they stand for truth. Sensitiveness for honor is high in officers and students; and the professor must not only be a part of this forward movement, but he must be a leader in it. Success comes to him only by taking worthily the position accorded to him. This leadership, which involves personality, character, and scholarship, reacts upon the professor himself at the first moment of success, and in this fact lies the secret of his devotion to his work. The professor's life becomes permeated with a quiet force, the value of which is realized only when one comprehends what a power a student body is for good or evil. These students not only are a power among themselves, but they are a tremendous influence upon the community, and it follows naturally that every action of the professor touches vitally the stability of the community and of the country. Such leadership brings with it a reward compared with which a few hundred dollars one way or the other in salary are of small significance. The professor does not accept other men's valuation of his work when it is estimated by the tuition fees of his students; but, held in a position of highest dignity by those about him, he lives a life of frugality, of simplicity, of influence, and above all, of happiness. He lives as, Mr. Lowell observed, in the only recognized aristocracy in America.

The second important consideration for the professor is his opportunity for research. Since the development of graduate schools in American universities, it is no longer sufficient

## COLLEGE PROFESSORS

for the professor to be merely a middleman in the distribution of knowledge, passing on year after year the same information taken from the same textbooks. An important function of the modern university is the extension of knowledge; and a university, in order to maintain its rank among the leading institutions of its kind, must contribute to this extension. It must be productive. The professor, therefore, feels it a duty to his college or university and to his own standing in his profession to keep in touch with what is being accomplished by scholars all over the world in his special department of study. He must himself be a productive scholar. In such work he finds great reward in terms of worth and dignity and intellectual satisfaction. Under the present salary schedules and administrative methods in many American universities this scholarly productiveness is carried on against greater obstacles than are similarly presented in the universities of Germany and of England. The scholar's work is seldom remunerative in a financial sense. The writer of popular textbooks and magazine articles receives not only a fair financial return for his work, but also obtains a popular reputation which is to his advantage. The scholar, on the other hand, who by his industry becomes a first authority in any branch of science or literature, will receive scant financial return for the publication of his monographs, but he wins through such publication high honor and respect among scholars for himself and for his university.

The following paragraphs are a survey of college teachers' compensation in currency. Fifteen institutions pay a maximum salary of \$4500 or more; 5 of these pay some salaries over \$5500. In 32 institutions the maximum salary is \$3000 or more. The following institutions are at the head of the list, with the average salary of the full professor as follows: College of the City of New York, \$4788; Harvard University, \$4413; Columbia University, \$4389; Leland Stanford Junior University, \$4000; the General Theological Seminary, \$4000 and a residence; University of Chicago, \$3600; University of Toronto, \$3600; Yale University, \$3500; University of Pennsylvania, \$3500.

The salaries of professors in a representative group of smaller colleges which offer a high grade of instruction are as follows: Beloit College, \$1650; Bowdoin College, \$2402; Centre College, \$1630; Drury College, \$1400; Hamilton College, \$1890; Grinnell College, \$1150; Knox College, \$1580; Smith College, \$2150; Stevens Institute of Technology, \$3130; Trinity College, \$2070.

The income of college teachers, however, is often larger than the figures as given represent. A large proportion of law school teachers, for example, are practicing lawyers or judges sitting on the bench. In medical schools few professors are not engaged in

## COLLEGE PROFESSORS

active practice; often the professorship is accepted because of the prestige it confers rather than for its direct emolument. In engineering schools professors are generally in active consultative work, and in one of the largest schools of this kind it is estimated that every professor doubles his salary by fees. In the academic departments the opportunities for profitable employment outside the college are fewer. A certain amount of analysis is done by the scientific professors, and in the language departments of universities situated in great cities the professors of distinction are sometimes in possession of lucrative offices with publishing firms. Outside of these exceptions, lecturing, magazine writing, and the editing of new editions are about the only sources of additional income, and the receipts from these sources are seldom large.

In most institutions there is a professorial grade below the rank of the full professor, frequently two grades. These grades, styled without much uniformity associate professor, assistant professor, or adjunct professor, pay in the hundred strongest institutions an average salary of \$1900 to the associate professor, and of \$1600 to the assistant professor. The largest average salary of the associate professor and of the assistant professor is paid by Harvard University—\$3400 and \$2719 respectively.

The grade of instructor represents as a rule a teacher giving full time to the college, but doing so at the beginning of his career, with high probability of advancement if he proves efficient. The average salary for this grade is a little over \$1000.

A study of the question of college salaries shows that the variation in compensation corresponds in considerable measure to the variation in the cost of living. It is clear that in a small town in the middle west, in which house rent is \$200 a year, and in which servant hire is \$10 a month, a salary of \$2000 may well be a comfortable one, while a salary of \$4000 in New York will not secure equal advantages. In other words, there is for each locality an approximate line of comfort in the remuneration of such a member of the social order as a professor. The individual receiving a salary above this line is comfortable; the individual receiving a salary below it must have more or less worry over the financial problem. G. H. M.

**England.**—It is difficult to make any but a general statement with regard to salaries in English universities, since no returns are published. It is usual for a lecturer to enter on university work at a salary of from £120 (\$600) to £150 (\$750). From this minimum he may rise to a professorship the salary of which may vary from £300 (\$1500) in the smaller universities to £1000 (\$5000) or more, if the chair be well endowed.

**Germany.**—Salaries of professors in the universities of Germany are paid by the State.

While certain scales of pay exist, the professors can always add to their salaries by the receipt of a portion of the fees. The ordinary professor (*ordentlicher Professor*) receives in Prussia from 4000 M (\$1000) to 6000 M (\$1500) outside Berlin, and 4800 M (\$1200) to 7200 M (\$1800) in Berlin. To these sums must be added compensation for rent, which varies with the location of the university. In Bavaria the salaries of professors are from 4560 M (\$1120) to 6000 M (\$1500), with compensation for rent. In Saxony the minimum is 3000 M (\$750). These salaries are in most cases considerably increased by the fees. The extraordinary professor (*ausserordentlicher Professor*) in Prussia, if salaried, receives from 2000 M (\$500) to about 6000 M (\$1500), but the receipt from fees is much smaller. The privat-docents receive salaries only in rare cases.

Professors, when no longer able to continue their work, are retired on full pay in most universities; in Leipzig a pension is arranged by agreement. Widows and orphans of professors receive a small allowance usually from the university treasuries.

**COLLEGE, RELIGIOUS LIFE AND INFLUENCE IN THE AMERICAN.** — See COLLEGE, AMERICAN; STUDENT LIFE; STUDENT VOLUNTEER MOVEMENT.

**COLLEGE REQUIREMENTS FOR ADMISSION, OR COLLEGE ENTRANCE REQUIREMENTS.** — The term "requirements for admission" among institutions of higher learning is one which covers the moral, physical, and intellectual qualifications deemed pre-requisite for enrollment as a student in a given course or department. Some explanation of the three phases of these requirements follows. The moral requirement is usually not more than a "statement of good character" from a responsible person on behalf of the candidate. The physical requirement is (1) the attainment of a minimum age ranging variously from 14 to 18 years; and (2) soundness in body and mind. The latter is, as a rule, an unwritten requirement.

The intellectual requirement, which embodies the main problem of college admission, includes the satisfactory completion of a group of studies based upon the work of the first seven or eight grammar grades. For convenience this academic work is frequently expressed in terms of units. Thus, the subject of plane geometry is estimated at one unit, and four books of Caesar are estimated at the same value. A unit represents approximately one

fourth of a year's work in a high school or an academy. Sixteen such units are ordinarily completed in a four-year high school course. Both in theory and in practice we have colleges whose courses, leading to collegiate degrees, are based on from three to 16 of these units. In effect a college which requires only three units of academic work for admission is a high school with some college work offered in its higher classes. The leading colleges and universities have, however, after long evolution, arrived at a fair degree of uniformity in entrance standards; the variation ranges from 14 to 16 units. Thus Yale requires 14.5 units; the University of Michigan, 15 units; Leland Stanford, 15 units; Harvard, 16 units.

With regard to the exact subjects required, both principles and practice have undergone great change in the last decade. Colleges and universities have recognized that almost any study which is worthy of a place in a high school course is acceptable for admission to college. Manual and industrial subjects are accorded respect with the traditional classical subjects. At this time most of the leading colleges divide their entrance subjects into two groups: (1) the *specified subjects*; (2) the *elective subjects*. The amount of the first group varies from 3 units to about 12 units. From two to three years' study of English is usually specified; also algebra through quadratics, plane geometry, and a year or more of foreign language. The full quota of the requirements may then be made up from electives, which include studies in history, science, mathematics, language, economics, music, and the manual and industrial subjects. As an illustration, the entrance requirements to the University of Minnesota are herewith given: —

<i>Specified subjects:</i>	
English	3 units.
Elementary algebra	1 unit
Plane geometry	1 unit.

In addition to the above, 9 units must be offered from the following group of electives. The number of units as stated after each subject is the maximum amount of credit which may be obtained in that subject.

<i>Elective subjects:</i>			
Mathematics	1 unit	Norwegian-Swedish	2 units
Latin	4 units	History	3 units
Greek	2 units	American government	.5 units
German	2 units	Science	6.5 units
French	2 units	Business subjects	6.5 units
Spanish	2 units	Manual subjects	9 units

Diversity of the administration of entrance requirements has an important bearing upon the entire problem. Some institutions admit students only upon examination (Bryn Maur, Columbia, Harvard, Haverford, Princeton, Radcliffe, Stevens Institute of Technology, Yale). Some admit students upon certificates from secondary schools (see ACCREDITED SCHOOLS); some on probation upon the recommendation of high school principals. The great majority of institutions admit students on certificates,

a system which in many instances includes an intelligent inspection of the high schools from which certificates are acceptable. In Minnesota, for example, this inspection is made under the supervision of the state superintendent of instruction; in Iowa, Missouri, Kansas, and other states the inspection is made under the supervision of the respective state universities and their lists of "accredited schools" and of "partially accredited schools" are generally used by the other first-grade colleges of the states. (See ACCREDITED SCHOOLS.)

Students are usually admitted to college under one of three general classifications: (1) regular students, those who have met fully the entrance requirements and who are candidates for a degree; (2) conditioned students, or those who have failed by a small margin to meet the full requirements, but who are admitted as candidates for a degree; (3) special students, or those who do not meet the regular entrance requirements, but who, usually on account of maturity of years, are deemed qualified to enter certain courses. Such students are not candidates for degrees.

The purposes of entrance requirements may be summarized briefly. They aim (1) to eliminate from college classes students unfit to pursue the work to their advantage; (2) to vitalize and to stimulate secondary schools by well-guarded articulation. It follows that the requirements serve to protect the scholarly standards both of the high schools and of the colleges.

**Historical Development in America.**—The history of college entrance requirements begins with the formulation of the first statutes for Harvard College in 1642, though the work of the college began four years earlier. These statutes provide: "When any Schollar is able to read Tully or such like classical Latin Author extempore, and make and speake true Latin in verse and prose, without assistance, and decline perfectly the paradigms of nouns and verbes in ye Greeke tongue, then may hee bee admitted into ye College, nor shall any claime admission before such qualifications." These requirements remained without material change until near the middle of the eighteenth century (1731). Even then the change was slight, a "speaking knowledge of Latin" was no longer required; and a knowledge of the rules of prosody could be substituted for the making of Latin verse. While the essential requirement in all colonial colleges was the grammatical knowledge of Greek and Latin with an ability to read easy Latin at sight, the colleges founded in the eighteenth century made further progress in the adjustment of the college curriculum to changed social conditions, and these were reflected slightly in the entrance requirements. In 1745 Yale, which hitherto had followed Harvard, added "common arithmetic" to the entrance re-

quirements. Princeton, formulating its entrance requirements in 1748, followed the earlier custom of Yale, and required only Latin and Greek. Columbia, adopting its first regulation in 1755, included "arithmetic so far as the rules of reduction," with Latin and Greek. Brown and Williams included arithmetic in the last decade of the eighteenth century, and Harvard shortly afterwards. The quantitative requirements in arithmetic were not usually specified, but those in Greek and Latin, so far as reading knowledge was concerned, gradually increased and became more specific. The classical requirements practically everywhere were ability to read Cicero's Orations, Vergil, Sallust or Caesar, and the Greek Testament. With the dawn of the new century, new social outlook, and new educational problems, the offerings of the college course increased rapidly and the entrance requirements responded similarly to the changed conditions. In addition to the expanded college curriculum (*q.v.*), the chief factor in bringing about a higher standard of admission was the substitution of the academies (*q.v.*) for the old Latin grammar school (*q.v.*) as the dominant secondary school. The academy offered the greatest variety of subjects for study, many of them of a more practical character, and in many ways was more responsive to changed social conditions. The chief modification made in the requirements for entrance during the first generation of the nineteenth century was the substitution of definite quantitative requirements of so many authors or texts read for the earlier test in ability to speak, read, or versify.

First of the new subjects required was geography, required by the Harvard statutes of 1807. Princeton made a similar requirement in 1819, Columbia in 1841, and Yale in 1822. English grammar was probably first required at Princeton in 1819. Yale followed in 1822, and the other colleges later. Algebra was first required at Harvard in 1820; Columbia followed with this requirement in 1821, Yale in 1846, and Princeton in 1848. Meanwhile the classical requirements were increased and the recognition of the problem of the overburdened college curriculum was given in 1832, when Columbia temporarily established a parallel course, — a scientific and literary one. For entrance to this French was required.

The great number of colleges founded during the early part of the nineteenth century represented newer educational ideas, attempted to meet more directly the new conditions, many of them of a frontier region and all less bound by tradition than the older institutions founded during the seventeenth and eighteenth centuries. Michigan University, opened in 1841, made the following requirements for admission: "Geography, arithmetic, the elements of algebra, the grammar of the English, Latin, and Greek languages, the exercise and

reader of Andrews, Cornelius Nepos, *Vita Washingtonii*, Sallust, Cicero's Orations, Jacobs' *Greek Reader*, and the Evangelists." This was increased six years later as follows: "English Grammar, Geography, Arithmetic, Algebra through simple equations, Krebs' *Guide for the writing of Latin*, Latin Reader, Cornelius Nepos, Cicero's Orations, Vergil's *Bucolics* and six books of the *Æneid*, Greek Reader through, Latin and Greek Grammar, Keightley's (or Pinnock's Goldsmith's) *Grecian History to the time of Alexander the Great, and Roman to the time of the Empire*."

Geometry appears as a college entrance requirement first at Yale in 1856, followed by Princeton, Michigan, and Cornell in 1868, and Columbia in 1870. History was first required in 1847, at both Harvard and Michigan, and at Cornell in 1868. History of the United States was required in 1870 at Michigan. Physical geography was added by Harvard and Michigan in 1870. The modern languages had received little recognition in the college course, and it was not until 1875 that an elementary knowledge of either French or German was required (at Harvard), for admission to the A.B. course. Other colleges followed. In 1897, however, only 60 of the 432 colleges reporting to the United States Commissioner of Education required a modern language for admission to the traditional (A.B.) college course, while 402 of the 432 required Latin and 318 Greek.

Since 1870 the expansion of requirements in the new subjects has been along the line of English and of the natural sciences. The great number of colleges now becomes prominent, the divergence in their customs concerning entrance requirements, the great increase in the quantitative requirements in the subjects previously required, the restrictive influences which began to be exerted by the colleges upon the secondary schools through the multiplicity and definiteness of requirements, all render it impossible to trace in a brief space the further development of these subjects individually; and these factors together give rise to the present-day question.

**The Problem of College Entrance Requirements.**—Until a comparatively recent time the only means of passing from the secondary school to the college was through an examination, given at the college, in certain prescribed subjects. This plan fixed upon the schools in an absolute manner both the course of study and the type of instruction which the colleges required of them. With the widening of the range of college subjects, there was a widening of the courses in the schools. But the schools could not afford to go much beyond the subjects demanded by the colleges. Many high schools had, however, grown up as public institutions designed to give a training different from the narrow and highly specialized work of the academies and preparatory schools. These schools gave courses

primarily in science, mathematics, history, and the modern languages; while the academies confined themselves mainly to Latin, Greek, and mathematics.

A number of causes tended to break down this division. The widening range of courses in the colleges referred to above, and especially the elective system, and the economic waste involved in maintaining two types of school, led to the absorption of many of the old academies into the public school system. Another factor was still more potent. The Western state universities, led by Michigan in 1870, began to adopt the plan (borrowed from the state system of Prussia) of admitting without examination all students certified by schools satisfactory to the university in courses and in the number and grade of the instructors. Michigan offered to send to any school, upon request, a committee that would inspect the work of the school and report to the university, which would determine whether the school in question should be placed on the accepted list. Fifteen years later, the same privilege was extended to high schools outside the state. This system of accrediting schools was soon followed by other universities: by Indiana in 1874, Wisconsin in 1879, California in 1884. By 1897 there were 42 state colleges and universities, and about 150 others, in which some form of admission by certificate was allowed. At the present time only a few of the larger and more conservative colleges (and those in the East), admit only by examination. The certificate privilege, though it exists in almost all the colleges, is, of course, not available for all candidates. Pupils from unaccredited schools, and those prepared by private tutors, must still take examinations even in certificating colleges. The net result of these various causes is, speaking generally, a broad difference between the relation sustained by the high schools to the colleges in the states west of the Appalachians and that existing on the Atlantic seaboard. In the former, there is a fairly unified system, in which the entrance from school to college depends only upon the fact that the school is assumed, upon certain evidence, to have given a sound course of instruction of the required sort; in the latter, there is a divided usage; some colleges insist upon the formal examination, others accept certificates. The colleges, in either case, are positive of the wisdom of their plan; the schools naturally prefer the certificate or accrediting system.

Those who favor the examination as the means of admission argue (1) that the college examinations have done much to build up the standards of instruction in the schools, and that a remission of the plan would be followed by a deterioration on the part of the schools; (2) that the examination tends also to keep up the colleges themselves to a high standard of admission; (3) that the range of choice in subjects makes the examinations a fair and liberal test of a student's abilities; (4) that it tends

to a desirable uniformity of standards both in school and colleges; (5) that the examinations, as conducted, do not unfairly rate the student, even though he takes them under strange and rather difficult conditions; (6) that the knowledge that he must pass such a test braces a pupil for his best efforts, and that, when he passes them, he gains a sense of confidence and power; (7) that the privilege of certification is often abused by principals, especially under pressure from parents or school boards; (8) that under infrequent or incompetent inspection poor schools often remain on the list; (9) that competent inspection is difficult and costly; (10) that the colleges requiring examination get better prepared students than do the certifying colleges. As will be seen, many of these arguments are statements of fact whose value depends upon proof of the fact. At present there is no scientific evidence to establish or to refute many of these points; consequently they remain, as yet, matters of opinion.

The arguments for the certifying or diploma system are also many, and, like the others, not all established. (1) Such a system, by removing arbitrary barriers, brings about a closer union between school and college, thus leading more boys to go to college; (2) under such a system college teachers and high school teachers come to understand each other's work better, to the great advantage of both fields; (3) inspection lifts the standard of high school work; (4) it allows more freedom in instruction, and so gives a better chance to the boy who is not going to college; (5) "cramming for examination," a confessed evil, disappears, and the pupil may study the subject for itself rather than as a subject to be examined in; (6) the school record of a boy's work, extending over four years, and taking into account his personal qualities, is a fairer test than any brief and impersonal examination; (7) the conditions under which examinations are taken place the candidate at a grave disadvantage; (8) the certificate system secures a better grade of pupils.

One of the most effective and far-reaching movements in this whole field is the work of the College Entrance Examination Board (*q.v.*). Its influence has been distinctly in the direction of maintaining uniformity in the courses and establishing uniformity in the nature of the instruction. Its examination questions are studied by teachers as a guide in their work; and its standards help the weaker schools to keep to a fair level of achievement.

**College Entrance Requirements in Latin and Greek.**—For a number of years after 1870 there was no essential change in the requirements for entrance to college in Latin and Greek. There was substantial agreement upon the main authors required; *i.e.* in Greek, Xenophon's *Anabasis* and Homer; in Latin, Caesar, Cicero, and Vergil; but there was wide divergence as to the amounts of these particular

authors required, and a number of colleges required the substitution of other authors for parts of these; so in Greek, Herodotus and parts of Xenophon's *Hellenica* or Lysias, and in some cases any classical author. In the case of Homer some made no requirements of special books, others allowed the substitution of parts of the *Odyssey* for the *Iliad*, etc., in Latin, for Caesar, Nepos, or selections from a reader, for Vergil, parts of Ovid, for some parts of Cicero, Sallust, etc. There was a wide divergence in the amount required. It varied in Greek from two to four books of Homer. In Latin, while the requirements in Caesar (or a corresponding amount of Nepos) and in Cicero (or a corresponding amount of Sallust) were generally the same, the colleges varied in asking from two books of Vergil to nine, and a number required the *Georgics* and the *Ecloques*. A large proportion of the colleges required an examination in sight translation in both subjects, following the example set by the University of Michigan, and the confusion was so extreme that Dr. Bancroft, the principal of Phillips Exeter Academy, remarked in 1885 that "out of over forty boys for college next year we have over twenty senior classes." The confusion was rendered worse confounded by the action of Harvard University, which in 1886 substituted for the specific requirements hitherto in vogue a general requirement of sight translation of simple Attic prose and verse and simple Latin prose and verse. This example was followed more or less by other colleges, particularly Bryn Mawr, which adopted the same plan in 1894.

The lack of uniformity in the entrance requirements in classics was represented in other directions, and led to the appointment in 1895 by the National Education Association of a committee to inquire into and report upon the whole subject of college entrance requirements. This committee gathered together a large amount of material with regard to the varying conditions in the United States, and published a preliminary report in the *School Review*, Vol. IV, pp. 341-460. At about the same time the American Philological Association appointed in December, 1894, a Committee of Twelve to take into consideration the question as to the amount of Greek and Latin needed for the various courses in secondary schools. This committee in 1896, at the suggestion of the National Education Association, was further directed to prepare at its convenience a report on the proper course of secondary instruction in Latin and Greek. After a vast amount of labor the commission finally made a report at the meeting of the American Philological Association in 1899, printed in Vol. XXX of the *Transactions*, Appendix, p. lxxvii.

The problem with regard to the courses in Greek was comparatively simple. The requirements for the three-year course are divided as follows. (See American Philological Association *Transactions*, Vol. XXX, p. xevi ff.)

## COLLEGE REQUIREMENTS

**GREEK:** 1st year. Introductory lessons; Xenophon, *Anabasis* (20 to 30 pp.); sight reading; writing; grammar. 2nd year. *Anabasis* or other Attic prose (75 to 120 pp.); sight reading; writing; grammar based on *Anabasis*, Bks. 1 and 2. 3rd year. Homer (2500 to 4000 lines); Attic prose (25 pp.).

**LATIN:** 1st year. Introductory lessons; easy reading (20 to 30 pp. of consecutive text); written exercises. 2nd year. Caesar, *Gallie War* (4 or 5 books). Other writers, e.g. Nepos (two books); prose composition at least once a week; reading aloud, memorizing passages, etc. 3rd and 4th years: Sallust, *Catiline*; Cicero (6 to 9 Orations, including *Manilian Law*); Ovid (500 to 1500 lines); Vergil, *Æneid* (6 to 9 books); one period a week in Latin composition, reading aloud, memorizing of selected passages.

The five- and six-year courses were merely amplifications of the four-year course, particularly in increasing the time devoted to the elementary study and adding further work in advance of the fourth year's requirements.

Observers of the results of the examinations of this period, particularly as set forth in the reports of the College Entrance Board, continued to be more and more exercised by the evident lack of success of the teaching of Latin in the schools as a preparation for these examinations; and along with the desire for uniformity in college entrance examinations grew the desire to increase if possible the efficiency of the teaching. The suggestion for betterment in this regard took the form of greatly increased emphasis on sight translation as the only adequate test of preparation in case it could not be made the only test.

These two movements resulted in the resolution passed by the American Philological Association in 1907, expressing its sympathy with the efforts being made to bring about uniformity in college entrance requirements. A further step was the appointment at the meeting of the American Philological Association in 1908 of a commission of 15 members to prepare a scheme for uniform entrance requirements. Its instructions involved the question of stating and modifying the requirements in conformity with the new ideas in teaching. This commission made its report at the meeting of the Philological Association, December, 1909. The report follows in part. (*Classical Journal*, Vol. V, pp. 156-157.)

1. Amount and Range of the Reading Required

1. The Latin reading required of candidates for admission to college, without regard to the prescription of particular authors and works, shall be not less in amount than Caesar, *Gallie War*, I-IV; Cicero, the Orations *Against Catiline*, *For the Manilian Law*, and *For Archias*; Vergil, *Æneid*, I-VI.

2. The amount of reading specified above shall be selected by the schools from the following authors and works: Caesar (*Gallie War* and *Civil War*) and Nepos (*Lives*); Cicero (Orations and *De Senectute*) and Sallust (*Catiline* and *Jugurthine War*); Vergil (*Bucolics*, *Georgics*, and

## COLLEGE REQUIREMENTS

*Æneid*) and Ovid (*Metamorphoses*, *Fasti*, and *Tristia*).

II. Subjects and Scope of the Examinations.

1. *Translation at sight.*—Candidates will be examined in translation at sight of both prose and verse. The vocabulary, constructions, and range of ideas of the passages set will be suited to the preparation secured by the reading indicated above.

2. *Prescribed reading.*—Candidates will be examined also upon the following prescribed reading: Cicero, Orations *For the Manilian Law* and *For Archias*, and Vergil, *Æneid*, I, II, and either IV or VI at the option of the candidate, with questions on subject matter, literary and historical allusions, and prosody. Every paper in which passages from the prescribed reading are set for translation will contain also one or more passages for translation at sight; and candidates must deal satisfactorily with both these parts of the paper, or they will not be given credit for either part.

3. *Grammar and Composition.*—The examinations in grammar and composition will demand thorough knowledge of all regular inflections, all common irregular forms, and the ordinary syntax and vocabulary of the prose authors read in school, with ability to use this knowledge in writing simple Latin prose. The words, constructions, and range of ideas called for in the examinations in composition will be such as are common in the reading of the year, or years, covered by the particular examination.

The chief and vitally important change in the requirements is the statement in general terms of the amount of Latin reading required, the extremely small amount of definite prescribed work, and the very high value set upon the ability to read at sight. These changes are in line with the most enlightened thinking on the subject by classical teachers of Latin both in this country and in England, and mark a very important step toward the ultimate goal where the sole test of knowledge of Latin shall be the ability to read at sight. (See LATIN IN THE SCHOOLS.)

G. L.

**College Entrance Requirements in English.**—Since 1885 the preparation for college in English has evoked more discussion than any other preparatory subject. Its prominence is, however, comparatively recent. Long after the admission requirements in Latin, Greek, and mathematics were definite in form and respectable in amount, English as an entrance subject was not mentioned. About the beginning of the nineteenth century there appear some slight beginnings. Nothing appeared, however, in the direction of the present full view of English as a preparatory subject, until Harvard, in 1874, required both literature and composition. This requirement was the germ of the present system. "Each candidate," says the Harvard announcement,

## COLLEGE REQUIREMENTS

will be required to write a short English composition correct in spelling, punctuation, grammar, and expression, the subject to be taken from such works of standard authors as shall be announced from time to time. The subject for 1874 will be taken from one of the following works: Shakespeare's *Tempest*, *Julius Caesar*, *The Merchant of Venice*; Goldsmith's *Vicar of Wakefield*; Scott's *Ivanhoe* and *Lay of the Last Minstrel*." This plan, with various modifications, was adopted by other colleges: by Michigan in 1878, by Cornell in 1883, by Princeton in 1885, by Columbia in 1891, and by Yale in 1894. By 1897 as many as eighty of the leading colleges had adopted the general plan. Some of the colleges examined on only a single author, as Cooper, Irving, or Goldsmith. But gradually the list grew, until, by 1895, ten or twelve books were required by many of the colleges in place of the half dozen of the earlier requirement. There was still, however, great diversity, not only in the books required by the various colleges, but also in the nature of the examinations. As a result, in a subject at best so indefinite as English, the fitting schools found their task seriously complicated. Various attempts were made to unify and standardize the requirements. The first were by the New England Commission of Colleges (*q.v.*) in 1885, and by the Association of Colleges and Preparatory Schools of the Middle States and Maryland (*q.v.*) in 1887. In 1894 the recommendations of these two associations were brought together, and a revised list of books was agreed upon by both, and adopted. This list was accepted also by the Association of Southern Colleges and Preparatory Schools and by the North Central Association. (See COLLEGE EXAMINATION AND CERTIFICATION BOARDS.) The Committee of Ten (*q.v.*) appointed in 1892 by the National Educational Association, to inquire into the whole matter of secondary curricula, gave especial attention to the unification of the English requirements, and also to a formulation of a course of study and of the principles which should govern instruction in English.

Since 1895 the modification of the requirements has been in the hands of a National Conference on College Entrance Requirements in English. This Conference is a joint committee composed of delegates from the college and preparatory school associations mentioned above, and also from the New England Association of Colleges and Preparatory Schools, and the College Entrance Examination Board (*q.v.*). The reports of this committee, which meets at least every three years, are referred to their respective associations for adoption. In one of its meetings (1897) it was agreed that the English course in the high schools should be the same for the students who were not going to college as for those who were. In this and succeeding meetings of the conference, the courses of study

## COLLEGE REQUIREMENTS

were framed by the Conference with this principle in view. Partly as a matter of convenience, and partly in acceptance of this view, the high schools have pretty generally adopted the recommendations of the conference; which has thus come to set the norm or standard for most of the secondary instruction in English throughout the country. The recommendations have, though frequently modified in the light of experience, not been universally satisfactory at any time, and are not so at present. It has been impossible to meet the special needs of all pupils and the special tastes and judgments of all teachers. But, none the less, the work outlined in these reports is substantially the course of study followed in almost all the good high schools and fitting schools of the country, and is the basis of the entrance examinations in practically all of the good colleges.

The most prominent changes in the recent recommendations of the conference have been (1) in the direction of emphasizing nonliterary themes as subjects for composition, and (2) in enlarging the list of books from which choices may be made. In 1905 the Conference, in response to a general and insistent demand for "more freedom," enlarged the list of books "for reading" from a list of ten required to a list of forty out of which ten were to be chosen. In 1908 and 1909 the list was still further enlarged. The report of the last Conference, held February, 1909, and making recommendations for the years 1913, 1914, and 1915, indicates the present status of the subjects. (See LITERATURE, ENGLISH IN THE SCHOOLS.)

F. T. B.

**College Entrance Requirements in Mathematics.**—The entrance requirements in mathematics in the American college were very limited until well into the nineteenth century. At present there is a rather uniform requirement in the various colleges of algebra through quadratics and plane geometry. Many Western colleges require plane and solid geometry, receiving students upon certificate, and demanding a less intensive course in plane geometry, but a broader course in the entire elementary field. Technological courses usually require solid geometry for entrance, and often plane trigonometry as well. All colleges give advance credit for higher algebra, solid geometry, and trigonometry, in case these subjects are not required for entrance, but are offered as part of the preparatory work.

The College Entrance Examination Board (*q.v.*), founded in 1900, a voluntary organization of representatives from various colleges and universities, at present sets examinations in the following subjects: (a) Elementary Algebra: (i) Algebra to quadratics, and (ii) quadratics and beyond. This is divided into two examinations, the first including roots and the theory of exponents, and the second covering quadratic equations, the binomial theorem for posi-

tive integral exponents, and formulas for the  $n$ th term and the sum of arithmetical and geometric progressions. (b) Advanced algebra. This includes permutations and combinations; complex numbers with graphic representation of sums and differences; determinants, chiefly of orders not exceeding four; numerical equations of higher degree, Descartes' rule of signs, and Horner's method of solution. (c) Plane geometry. The limitations are not definitely fixed by the board, the statement being: "The usual theorems and constructions of good textbooks, including the general properties of plane rectilinear figures; the circle and the measurement of angles; similar polygons; areas; regular polygons and the measurement of the circle. The solution of numerous original exercises, including loci problems. Applications to the mensuration of lines and plane surfaces." This practically means the plane geometry of Euclid, with an algebraic treatment of ratio and proportion, without the incommensurable cases, and with a large number of exercises. (d) Solid geometry. This requirement is also left indefinite, but it covers the ground of solid geometry as given by Legendre, upon whose work most of our American textbooks are based. (e) Trigonometry. The requirements are as follows: Definitions and relations of the six trigonometric functions as ratios; circular measurement of angles; proofs of principal formulas, in particular for the sine, cosine, and tangent of the sum and the difference of two angles, of the double angle and the half angle, the product expressions for the sum or the difference of two sines or of two cosines, etc.; the transformation of trigonometric expressions by means of these formulas; solution of trigonometric equations of a simple character; theory and use of logarithms (without the introduction of work involving infinite series); the solution of right and oblique triangles and practical applications, including the solution of right spherical triangles.

It is hardly probable that, with the present school system, the entrance requirements can be materially advanced. They may be changed to cover a broader field less thoroughly, but the time does not permit of any more extended treatment of mathematics save as an elective. It is coming to be felt that two years devoted to mathematics in the high school is all that can be demanded, and in this time it is not probable that more can be attempted than algebra through quadratics and plane geometry.

D. E. S.

**College Entrance Requirements in Modern Languages.** — Although a number of American colleges had begun to teach French before the end of the eighteenth century, and German in the first half of the nineteenth, yet modern languages were not regarded seriously in American higher education until comparatively recent times. Neither French nor German was required for

admission by any American college before 1875. In 1871 Harvard offered an optional admission examination in French for those students who wished to be excused from pursuing this subject in college. In 1875, however, a knowledge of either French or German was required of all candidates for admission. The requirement was defined as "translation at sight of easy French." Proficiency in grammar was accepted as an offset for some deficiency in translation.

For the courses leading to the Ph.B. or B.S. degrees, which had been instituted in many colleges between 1850 and 1870, an elementary knowledge of either French or German was generally accepted in place of part of the requirements in the classics. Still, even as late as 1897, only 123 out of 318 colleges and scientific schools in the United States required a modern language for admission to the B.S. course, while 176 required Latin; of 432 institutions having A.B. courses, 402 required Latin, 318 required Greek, while only 60 required a modern language, and 25 allowed the substitution of a modern language for Greek. (*Rep. Com. Ed.* for 1896-1897, pp. 457-613.) At the present time, modern languages may be freely substituted for Greek in nearly all, and for Latin in very many, of the best colleges, although frequently work in modern languages is still given less weight in the requirements for admission than corresponding work in the classics.

There used to be, and to a certain extent still is, great diversity in the definition of the requirements. Some institutions demanded only the ability to read simple prose and poetry at sight, others prescribed the number of pages which had to be read, while not a few went so far as to examine on certain specified grammars and reading texts. The first step toward securing greater uniformity throughout the country in College Entrance Requirements in the modern languages as well as in other subjects was the *Report of the Committee of Ten* (*q.v.*) (1894), which was followed by the *Report of the Committee of Twelve* of the Modern Language Association of America (1899). The Committee of Twelve proposed three grades of preparatory instruction in modern languages, to be known as the elementary, intermediate, and advanced course, and designed to correspond normally to courses of two, three, and four years respectively. These grades were adopted by the College Entrance Examination Board, and in this way a considerable amount of unification has been accomplished. The aim of the instruction and the amount of work to be done in the different grades, in accordance with the recommendations of the Committee of Twelve, are essentially as follows: (a) For the elementary course. Ability to translate at sight easy prose, to put into the foreign language simple English sentences taken from the language of everyday

life or based upon a portion of the foreign text read, and to answer questions on the rudiments of the grammar. The work for this course is to consist, in French and Spanish, of the reading of 350 to 375 pages; in German, of 225 to 300 pages; in addition to careful drill in pronunciation, the necessary work in grammar with exercises, and translations into the foreign language. (b) For the intermediate course. Ability to read at sight French or German of ordinary difficulty, to put into the foreign language a connected passage of English based on the text read, and to answer more difficult grammatical questions. The amount of reading for this course (the third year of the study) is set down as 400 to 600 pages of French or 400 pages of German, supplemented by grammatical drill and the constant practice in giving paraphrases or writing abstracts of portions of the matter read. (c) For the advanced course. Ability to read at sight difficult French not earlier than that of the seventeenth century, or "any German literature of the last one hundred and fifty years that is free from any unusual textual difficulties," to put into the foreign language a passage of easy English prose, and to write in French, or German, a short essay or theme. The French requirement adds: "To carry on a simple conversation in French," while, in German, "the ability to answer in German questions relating to the lives and works of the great writers studied" is demanded. The work of the last year is to comprise the reading of from 600 to 1000 pages of standard French, classical and modern, or of about 500 pages of good German literature respectively, besides the writing of numerous short themes, independent translation of English into the foreign language, and (at least in German) reference readings upon the lives and works of the great writers studied.

While the *Report of the Committee of Twelve*, containing these recommendations, has unquestionably been of very great service to the cause of modern language instruction in this country, the experience of the last decade has suggested certain modifications, which may be summarized, as follows: (1) Quantitatively, the requirements are too large for thorough, intensive work. It is safe to say that, under ordinary conditions, it is impossible to do the prescribed amount of reading in a proper way, if careful attention is to be given to the pronunciation, and if the other very important lines of work which are suggested in the *Report* are to be carried on at the same time. As in other subjects, the tendency is now to reduce the quantity of the requirements, and to enable the schools to do more thorough work and to produce more satisfactory results than they do at present. (2) There is need of still greater definiteness with regard to the reading matter. The terms "easy prose," "prose of ordinary difficulty," etc., even if illustrated, as they are, by a list of suggested readings under the va-

rious courses outlined, are rather vague, and the examination, which in a large measure is based on sight translation, becomes correspondingly uncertain as a test of the candidate's real ability. The adoption of a rotary system of tests for the minor part of the work to be done, similar to the system established for C.E.E.B. examinations in English, or the prescription of a definite vocabulary, at least for the elementary course, have been proposed as remedies. (3) There is greater emphasis necessary on oral training and on the understanding of the spoken language. The reform of the methods of instruction in the modern languages which has been going on in European schools for the past two or three decades is beginning to lay hold on American teachers, and must ultimately bring about a modification of the present entrance requirements. This modification will probably consist in some form of an oral examination, testing the candidate's pronunciation of the foreign tongue, as well as his ability to understand the language when spoken and to express himself in it with reasonable fluency and correctness. F. M.

**College Entrance Requirements in History.**—History received its first recognition as a requirement for entrance to college in 1847. In that year Harvard prescribed Worcester's *Elements of Ancient History*, and the University of Michigan prescribed "Keightley's (or Pinnock's Goldsmith's) *Grecian History to the time of Alexander the Great, and Roman to the time of the Empire*." For some years the requirement was associated somewhat closely with the older requirement in geography. Both at Harvard and at Michigan examinations in the two subjects were given by the department of history, and the questions set bear evidence of an intention to keep the two fields of knowledge related. American history to the end of the Revolution was added by Michigan in 1870, and the classical requirements at Harvard were, during the next decade, occasionally increased by chapters from Freeman's *General Sketch of European History*. Cornell, founded in 1868, introduced at the beginning a requirement of Greek and Roman history. After 1870, the history requirement gained steadily in favor, especially with the newer and smaller colleges. In 1895, out of a total of 475 universities and colleges investigated by the Bureau of Education, 306 required American history; 127, general history; 112, Greek history; 116, Roman history; 57, English history; 9, state and local history; and 1, French and German history. (*Rep. Com. Ed.*, 1896-1897, p. 468.) The knowledge expected must, however, often have been the merest outline, for, as late as 1890, some of these institutions were still using in their own classes textbooks like Swinton's *Outlines*, Anderson's *General History*, and Barnes' *United States*. The diversity of subject matter required was probably greater than in any other branch of instruction.

## COLLEGE REQUIREMENTS

The first important step in the reform of these conditions was taken by the Madison Conference of 1892. The conference did not feel called upon to frame a definite system of entrance requirements, but its brief discussion of the problem and its recommendations for the general improvement of history teaching in the schools suggested, directly or indirectly, the essential features of the system afterward adopted. The next important step was taken in February, 1895, in the appointment, by the New England Association of Colleges and Preparatory Schools, of a committee of school and college teachers of history to deal with the special question of entrance requirements in history. The report of this committee, adopted by the Association in October, 1895, proposed a list of seven topics, each representing one year's work of three periods a week, and requested the colleges to accept any two of these topics as a required subject for entrance. The colleges were further requested to accept "any additional topic or topics from the list as additional preparation for entrance or for advanced standing," and to recognize as "a considerable part of the evidence of proficiency required" certain specified kinds of written work done in the secondary school. The report suggested that entrance examinations in history should be so framed as to require on the part of the candidate comparison and judgment rather than mere memory, and that they should include tests of geographical knowledge. The use of good textbooks, collateral reading, and practice in written work were to be presupposed. The seven topics were: (1) The history of Greece, with especial reference to Greek life, literature, and art. (2) The history of Rome; the Republic and Empire, and Teutonic outgrowths to 800 A.D. (3) German history. (4) French history. [(3) and (4) to be so taught as to elucidate the general movement of medieval and modern European history.] (5) English history, with especial reference to social and political development. (6) American history, with the elements of civil government. (7) A detailed study of a limited period, pursued in an intensive manner. Three of these topics were in the course of study for secondary schools recommended by the Madison Conference. The other features are directly suggested in the conference report (*Publication No. 5, New England History Teachers' Association, p.13*).

These recommendations were indorsed, a few months later, by the Schoolmasters' Association of New York and Vicinity. The latter had, however, already proposed a conference on the whole question of entrance requirements, and such a conference had, on the invitation of Columbia, been arranged. It was attended by representatives from Harvard, Yale, Columbia, Cornell, Princeton, and Pennsylvania, and made its report on the first of February, 1896. The recommendations of the New England

## COLLEGE REQUIREMENTS

Association relating to written work and to examinations were adopted, practically without change. The principle of a choice of topics was also adopted, but the details were considerably modified. As additional preparation for entrance, or for advanced standing, the Columbia Conference proposed a second group of topics, each representing two years' work of three periods a week: (1) A course of Greek and Roman history for those only who have offered English history and American history as an elementary subject. (2) A course in English history and American history for those who have offered Greek and Roman history as an elementary subject. (3) A course in the history of Europe from the Germanic invasions to the beginning of the seventeenth century. (4) A year's study of any of the elementary fields not already offered as an elementary subject, combined with a year's study of a limited period within that field. (*Publication No. 5, New England History Teachers' Association, pp. 16, 17.*)

In the meantime, the Committee on College Entrance Requirements appointed by the National Educational Association in July, 1895, had been seeking the cooperation of organizations interested in the problem from the point of view of the special subjects. The response of the American Historical Association was the appointment of the Committee of Seven, whose report, made in 1899, remains the standard document on the whole question of history in American secondary schools. In framing recommendations on college entrance requirements the Committee of Seven recognized two things as essential: (1) "that the fundamental scope and purpose of the major part of the secondary schools be regarded"; and (2) "that elasticity be allowed that schools may fit pupils for college and yet adapt themselves to some extent to local environment and local needs." (*Report, 121.*) A "unit" of history was defined, as "either one year of historical work wherein the study is given five times per week, or two years of historical work wherein the study is given three times per week." The recommendations may be summarized as follows: (1) Institutions with a "system of complete options in college entrance requirements" (*e.g.* Leland Stanford) were asked to accept 4 units in history "as an equivalent for a like amount of work in other subjects." (2) Institutions that prescribed certain studies and, in addition, required others from an optional list (*e.g.* Harvard) were asked to place 1 unit of history on the prescribed list, and 1, 2, or 3 units on the optional list. (3) Institutions with prescribed requirements only, *i.e.* "without options" (*e.g.* Yale), were asked to require at least one unit of history. (4) Institutions with several distinct college courses requiring different groups of preparatory studies for entrance (*e.g.* Michigan) were asked to require 1 unit of history for the

classical course; 1 unit for the Latin course; 2 units for the scientific course; and 3 units for the English course. (*Report*, 123-129.) The Committee of the National Educational Association accepted these recommendations, but with the proviso that one year of American history and government should be accepted as a requirement for admission by all colleges and universities. In a similar spirit the recommendation for a year of intensive study was qualified by the phrase, "especially of the United States." (*Proceedings*, N. E. A., 1899, pp. 648, 665.) At the present time, the units most widely recognized are the "blocks" or periods proposed by the Committee of Seven for a four-year course in secondary schools: (1) ancient history; (2) medieval and modern European history; (3) English history; (4) American history and civil government. These are the subjects listed by the College Entrance Examination Board. The question of entrance requirements continues to agitate teachers of history. It is admitted that the action of colleges in recent years in increasing the amount of history that may be offered for entrance has tended to increase the amount of history taught in secondary schools, but its influence on methods of teaching remains questionable. Teachers still complain, as they complained in the days of the Madison Conference, that the present examinations compel the use of "bad methods for college preparation," and they are still urging, as the Madison Conference urged, "a change by which schools which use proper methods shall have some advantage." A Committee of Five of the American Historical Association is now at work revising the report of the Committee of Seven.

H. J.

**College Entrance Requirements in Science.**—The natural sciences appear first in the list of college entrance requirements in 1870, although in some form they had appeared in the college curriculum from the seventeenth century, and some elementary natural science had been incorporated in the elementary or secondary schools for two or three generations. Astronomy, physics (natural philosophy), chemistry, physical geography, botany, and zoology (natural history) were made of vital concern to secondary pupils long before the colleges recognized their significance in public education. Through the public secondary schools the community gradually forced a change in the higher curriculum. The movement toward public control of education made most rapid progress in the West, where the state universities established the custom of accepting for admission any good four-year high school course. Toward the close of the nineteenth century, the following subjects were included among those satisfying college entrance requirements: astronomy, botany, chemistry, geology, physics, physiography, physiology, and zoology. During the last two

decades a question concerning the amount and character of the science work to be given by secondary schools and required or accepted by college for entrance has been the subject of prolonged controversy among teachers of science, as has the similar question among teachers of English, classics, and the other subjects of the curriculum. The science controversy has centered on physics, as this is the science most frequently required for college entrance, and most frequently given by the secondary schools. This discussion has given rise to what is popularly known as the "new movement among physics teachers," though it is allied to a larger movement going on among students of this subject both here and in Europe. A syllabus of a list of topics and experiments relating to the metric system, mechanics, heat, sound, light, magnetism, static electricity, and current electricity, has been adopted for the guidance of teachers and examiners. (See PHYSICS IN THE SCHOOLS.)

In 1908 the College Entrance Examination Board (*q.v.*), failing to find a commission of college professors who could agree upon a syllabus of requirements in physics for the secondary schools, appointed six secondary school teachers of physics to undertake the task. These promptly and unanimously prepared a syllabus which the board adopted forthwith and in which all parties concerned acquiesced.

The following gives the substance of these recommendations. (For the content of the course recommended, see PHYSICS IN THE SCHOOLS.)

1. The Unit in Physics consists of at least 120 hours of 60 minutes each. Time spent in the laboratory shall be counted at one half its face value.

2. The Course of Instruction in Physics should include:—

- (a) The study of one standard textbook, for the purpose of obtaining a connected and comprehensive view of the subject. The student should be given opportunity and encouragement to consult other scientific literature.
- (b) Instruction by lecture table demonstrations to be used mainly for illustration of the facts and phenomena of physics in their qualitative aspects and in their practical applications.
- (c) Individual laboratory work, consisting of experiments requiring at least the time of 30 double periods. The experiments performed by each student should number at least 30. Those named in the appended list are suggested as suitable. The work should be so distributed as to give a wide range of observation and practice.

The aim of laboratory work should be to supplement the pupil's fund of concrete knowledge and to cultivate his power of accurate observation and clearness of thought and expression. The exercises should be chosen with a view to furnishing forceful illustrations of fundamental principles and their practical applications. They should be such as yield results capable of ready interpretation, obviously in conformity with theory, and free from the disguise of unintelligible units.

Slovenly work should not be tolerated, but the effort for precision should not lead to the use of apparatus or processes so complicated as to obscure the principle involved.

## COLLEGE REQUIREMENTS

3. Throughout the whole course special attention should be paid to the common illustrations of physical laws and to their industrial applications.

4. In the solution of numerical problems, the student should be encouraged to make use of the simple principles of algebra and geometry to reduce the difficulties of solution. Unnecessary mathematical difficulties should be avoided, and care should be exercised to prevent the student's losing sight of the concrete facts in the manipulation of symbols.

The other sciences, botany, chemistry, geography, zoölogy, for which entrance credits are given, do not present a problem of as great importance or significance as physics or the other subjects. Such subjects have been offered only in the last few years (zoölogy for the first time at the College Entrance Examination Board in 1907, and then only by two students); are chosen by very few students, and are not subjects so generally taught in the schools. Consequently the demands of the college influence are not so keenly felt in the schools in these subjects, nor so resented. Requirements for entrance credits are in the process of formulation, and little of a general nature has been agreed upon. The American Federation of the Teachers of the Mathematical and Natural Sciences, representing eight constituent associations, in their meeting in Boston, Dec. 27, 1909, initiated a movement for a reformation of the entrance requirements in chemistry, and presented the matter to the College Entrance Examination Board.

J. H. W.

**Other Subjects.** — The recently added subjects of drawing and music, similar to the recent addition of science and modern language subjects (that is, botany, zoölogy, Spanish, etc.), have afforded so little experience that no settled policy exists. The following summary of the examinations taken in 1909 under the College Entrance Examination Board indicates with fair degree of accuracy the relative importance of these various branches as subjects for college entrance.

*English:* (a) Reading, 1706, (b) study, 1368; total, 3074.

*History:* (a) Ancient, 734, (b) Medieval and Modern, 39, (c) English 394, (d) American 544; total, 1711.

*Latin:* (a) (i) Grammar, 1166, (ii) Elementary prose composition, 1152, (b) Caesar, 941, (c) Cicero, 1009, (d) Vergil, *Æneid*, I-VI, 433, (e) Nepos 0, (bc) Caesar and Nepos, 50, (f) Sallust, 7, (g) Ovid, 14; (l) Prose composition, 773, (m) Elementary sight translation of prose, 823, (p) Advanced sight translation of prose, 189, (q) Sight translation of poetry, 110, (dq) *Æneid*, I-VI, and sight, 330; total, 6997.

*Greek:* (a) (i) Grammar, 195, (ii) Elementary prose composition, 231, (b) Xenophon, 228, (c) Homer, *Iliad*, I-III, 66, (f) Prose composition, 125, (g) Sight translation of prose, 187, (h) Sight translation of Homer, 2, (ch) *Iliad*, I-III and sight, 105; total, 1142.

*French:* (a) Elementary, 1196, (b) Inter-

## COLLEGE REQUIREMENTS

mediate, 629, (bc) Intermediate and advanced, 91; total, 1916.

*German:* (a) Elementary, 1170, (b) Intermediate, 741, (bc) Intermediate and advanced, 72; total, 1783.

*Spanish*, 14.

*Mathematics:* (a) Elementary algebra, 1445, (a) (i) To quadratics, 266, (ii) Quadratics and beyond, 126, (b) Advanced algebra, 143, (c) plane geometry, 1425, (d) Solid geometry, 237, (cd) Plane and solid geometry, 290, (e) Trigonometry, 58, (f) Plane trigonometry, 334; total, 4324.

*Physics* 619; *Chemistry*, 439; *Botany*, 18; *Geography*, 25; *Zoölogy*, 9; *Drawing*, 122.

*Music:* (a) Appreciation, 4, (b) Harmony, 7, (c) Counterpoint, 1, (d) Pianoforte, 3, (e) Voice, (f) Violin; total, 15.

Grand total, 22,208.

**COLLEGES AND SECONDARY  
SCHOOLS, ARTICULATION OF.** — The edu-  
cational system of the United States is com-  
posed of a number of separate institutions,  
each built up for a specific purpose. It com-  
prises elementary schools, industrial schools,  
commercial schools, universities, and pro-  
fessional schools. In some cases these types  
of schools exist without particular reference  
to one another. In the interest of efficiency  
a continuity is each year being more and more  
perfected among these institutions, especially  
between the secondary schools and colleges.

Historically, any articulation between sec-  
ondary schools and colleges is an afterthought.  
Unforeseen social emergencies arise; we en-  
deavor to meet them not by creating out of  
hand entirely new agencies and institutions,  
but by converting to our purpose whatever  
is found available. The high school and the  
college were at first independent organizations.  
The academy (*q.v.*), which preceded the high  
school as the dominant secondary school, was  
in most cases independent of the college, and in  
many cases a substitute for it. But the exten-  
sion of the scope of the college and the in-  
creasing frequency with which the high school  
student was graduated into it suggested and  
made possible a coöperative relation between  
them. It is not to be wondered at that some  
hesitation and confusion have attended the  
adaptive process. Two types of institutions  
that have in one section competed for the same  
body of students, and in another have aimed  
to do each in its own degree the same sort  
of service to different groups of the population,  
do not without friction take position in refer-  
ence to each other, both subordinating them-  
selves to a single conception.

At the present time most colleges base the

work of their freshman classes upon the four-  
year high school course. With this concep-  
tion of the relation of the college to the high  
school, the colleges by means of definite re-  
quirements for admission seek to test the fit-  
ness of each candidate for admission. (See  
COLLEGE REQUIREMENTS FOR ADMISSION; COL-  
LEGE ENTRANCE EXAMINATION BOARDS.)

The first step in the consideration of this  
subject is the recognition that in the final  
analysis the college is dependent for its success  
upon the efficiency and the integrity of the  
secondary school. If the schools are well  
conducted and efficient, they will send up  
well-prepared students; if they are demoralized  
or inefficient, no certificate of admission and  
no examination can transform those who come  
from them into fit college students. The  
colleges, therefore, by enforcing strictly a  
reasonable standard for admission protect  
their own standards of scholarship, and make  
possible the existence of a secondary school  
system with which they may coöperate.

Further, the significance of good articulation  
lies in the ideal of social and intellectual  
development for which the college stands.  
That ideal contemplates a group of able, cul-  
tured, and devoted teachers living and work-  
ing in social and intellectual communion  
with an alert body of youth so nearly homo-  
geneous in age and intellectual equipment  
that the members of this body react the one  
upon the other. Such interaction creates  
the true college life. Its vigorous growth  
is impossible without such teachers; it is  
most difficult when the intellectual homo-  
geneity of the student body is discharged.  
The moment there is introduced into a college  
class a large proportion of mature students,  
or of ill-prepared students, the difficulties  
of instruction are enormously increased, and  
the general good of the body which the  
college most directly seeks to serve is sacrificed  
to give a chance to an entirely different class.

Three classes of students are usually ad-  
mitted to college: regular students, conditioned  
or deficient students, and special students.  
There is no general agreement as to the mean-  
ing of these terms. The chief difficulty in  
differentiating these classes arises out of the  
fact that the conditioned and the special  
students cannot be viewed from the same  
angle with relation to the secondary school.  
It is clear that all students admitted to college  
who are over twenty-one years of age do not  
affect the high schools. They are beyond  
the usual high school age. On the other hand,  
any student under twenty-one years of age  
who has not completed the high school course is  
still to be thought of as nominally a secondary  
school student, and his admission to college  
under any classification serves to confuse  
the two fields of education.

The following distinctions are now widely  
in use. (1) Regular students. This group

includes all students who have met the full requirements for admission, whether they pursue courses leading to degrees or take special work. (2) Conditioned students. This group includes two classes of students who have not met the full requirements for admission: (a) Students enrolled as candidates for a degree; (b) students under twenty-one years of age not candidates for a degree, taking special work. (3) Special students. This group includes all students over twenty-one years of age who are not candidates for a degree and who have not met the requirements for admission.

The second group needs a brief explanation. This classification embodies three main types:—(1) Students admitted into the freshman class upon a high school certificate, having completed less than the full four-year high school course. The practice of institutions in the number of deficiencies which may be permitted varies. In some cases students are accepted with as much as a year's work below the stated requirements. (2) Students who have completed satisfactorily a four-year high school course, but who have been conditioned because they are not able to offer the specific subjects for admission. Thus, at the University of Minnesota 15 units are required of all students admitted to the Department of Literature and Arts. No student is admitted who does not present this amount of secondary school work. The university requires, however, that 4 units shall be offered in English, 1 in algebra, and 1 in plane geometry. A student may be conditioned under the rules of this university to an extent not to exceed 1.5 units of this specified work, provided that his total high school credit amounts to fully 15 units. (3) Students who have completed in secondary schools or under private tutors all the studies required for admission, but who have failed in the entrance examinations to pass all these subjects. This group of conditioned students is confined almost exclusively to the institutions which admit only by examination, such as Harvard, Columbia, Princeton, Massachusetts Institute of Technology, Radcliffe, Stevens Institute, Yale, Haverford, and Bryn Mawr.

**COLLEGES AND UNIVERSITIES, RELIGIOUS OR DENOMINATIONAL CONTROL OF.**—Two thirds of the 750 institutions in the United States and Canada normally termed colleges are organically controlled by religious denominations. This control is exercised generally in one of two forms: either the college is within the legal control of the denomination through the power of an ecclesiastical assembly or dignitary to elect, nominate, or confirm the election of a majority of the board of trustees of the college; or the government of the college is irremovably vested in the membership of a specified denomination through a legal requirement that a majority of the board

of trustees must be members of that denomination. Syracuse University, a majority of whose trustees are by the university charter elected by conferences of the Methodist Episcopal Church, is an example of legal control held by the denominational organization; the University of Chicago, whose charter requires two thirds of the trustees to be members of regular Baptist churches, is an example of control fixed in a denominational membership. The University of Wooster, which is governed by trustees elected by the Presbyterian Synod of Ohio, three fourths of whom must be Presbyterians, combines both methods of control. The control by the denominational body exists in two hundred American and Canadian colleges, which are principally those connected with denominations of the episcopal and presbyterial polity; the control through a denominational test exists in 89 American colleges, principally those founded by denominations which have no administrative authority higher than the congregational meeting. The combination of both methods of control is rare. In the Roman Catholic colleges a religious test upon the trustees never legally exists, and the board of trustees is generally legally self-perpetuating, but the fact that the trustees are almost invariably professed members of the religious communal order which founded the college vests the government of the college, through the vows of the trustees, actually in the order. There are in the United States and Canada nearly two hundred such Roman Catholic colleges.

While all of the early collegiate foundations in America owed their origin to religious influence, a legal control by a denomination as such seldom existed. The presence of the ministers of certain towns upon the Harvard Board of Overseers (founded 1636) and the visitatorial power of the Bishop of London over William and Mary College (1693) were primarily regulations of state, though the ultimate object was to perpetuate definite religious views and organization as well as to secure learned governors. The same objects prompted the rule for a clerical majority in the Yale Board of Fellows (1701). Princeton University (1746, then the College of New Jersey), the University of Pennsylvania (1755), and Dartmouth College (1769), never had any legal connection with any denomination. Brown University (1764), with a charter requiring a majority of Baptists on both governing boards, is the earliest case of a legal denominational control of a college in America. The reason for this control, like the reason for the requirement that the Rutgers College president (1766 as Queen's College) be Dutch Reformed, and the Columbia College president (1754 as King's College) by a contract with Trinity Parish, New York City, be Church of England, was to protect a minority religious body in the community.

## COLLEGES AND UNIVERSITIES

The policy of a denomination legally controlling a college therefore began as a protective measure. Where a denomination was dominant such a legal safeguard was not considered to be necessary. A reason similar to that in which it originated will account for the later growth of the practice. In the first half of the nineteenth century founders of colleges often felt that they must erect a bulwark against the college being quietly captured by the religious infidelity which arose at the period of the French Revolution; there was also some fear of other denominations. Today the strongest argument advanced by the defenders of the policy is that legal control by a church body or churchmen is a wise precaution against the introduction into the college governing board of men who under the guise of reconciling divergent opinions on minor matters will attempt to introduce a spirit hostile to the fundamental facts upon which historic Christianity rests.

Among the more prominent institutions legally under the government of their respective denominations are the following: University of Chicago (two thirds of trustees must be Baptists); Brown University (majority of governing boards must be Baptists); Colby College (majority of trustees must be Baptists); Bryn Mawr College (all of trustees must be Quakers); Haverford College (all of trustees must be Quakers); Northwestern University (majority of trustees must be Methodists); Syracuse University (majority of trustees elected by Methodist conferences); Boston University (two thirds of trustees must be Methodist); Vanderbilt University (election of trustees must be confirmed by Southern Methodist Education Board); Trinity College, N. C. (two thirds of trustees elected by Methodist conferences); Lafayette College (election of trustees must be confirmed by Presbyterian Synod); University of Wooster (trustees elected by Presbyterian synod, three quarters must be Presbyterians); Lake Forest College (election of trustees must be confirmed by Presbyterian synod); Queen's University, Kingston, Ont., (three quarters of trustees must be Presbyterians); University of Notre Dame (Roman Catholic Order of the Holy Cross); Holy Cross College, Georgetown University, and Fordham University (the Jesuit Order); University of the South (trustees are bishops of Episcopal Church and representatives of Episcopal dioceses); Kenyon College (majority of trustees are bishops of Episcopal Church and representatives of Episcopal dioceses). Also within the University of Toronto are federated colleges governed respectively by the Church of England and the Methodist Church.

The colleges of the Roman Catholic Church and of the Methodist Episcopal Church probably stand highest in the value of their properties and endowment, the institutions connected

## COLLEGIATE CHURCH SCHOOLS

with the churches of the Northern Baptist Convention also having large resources. The Congregational churches and the several societies of Friends are smaller religious bodies possessing comparatively large educational establishments. The Reformed Church in America, and the Church of the United Brethren in Christ also control collegiate equipment which is large in proportion to their membership. On the other hand, very few colleges are connected by legal ties with the Protestant Episcopal Church in the United States. One reason apparently for this is the concentration of the educational energies of that church upon secondary schools. M. S.

**COLLEGIATE CHURCH SCHOOLS.** — If the cathedral churches furnished the most ancient and chief schools of Western Europe during the Middle Ages, some of the collegiate churches were not far short of them in antiquity, and were the main sources of supply of schools. In England the early collegiate churches like Beverley, Ripon, and Southwell in the North, Crediton and Twyncham, afterwards Christ Church, Hants, in the South, and Chester in the Midlands were perhaps either ex-cathedrals or created as secondary bishop's sees. Ripon, due to Wilfrid, and Crediton were certainly such. Southwell in Nottinghamshire was declared to have been an ancient archiepiscopal see of the Archbishop of York by the Commissioners who reported on it at its dissolution. Hence naturally these colleges have retained the schools which they had set up when they were cathedrals. The rest being colleges of secular canons, though the word "college" (*g.r.*) is of much later date, maintained schools in imitation of the cathedral churches on which they were modeled. The bulk of the early group is due to the tenth century. In England a large number of them owe their existence probably, like Warwick, to Edward the Elder and his sister Ethelfleda, the lady of the Mercians who established a chain of burghs, or fortified towns, as strongholds against the Danes, when they reconquered the Midlands and the North from them from 912 onwards. Oxford, Bridgnorth, Warwick, Bedford, Tamworth, Stafford, Leicester, Derby are all towns which these two so treated and which are found after the Conquest

with ancient collegiate churches with ancient schools forming part of their foundation. Among those, imputed to Athelstan, who pursued the same policy, are Durham, afterwards changed to a monastic cathedral, Beverley Minster, and Bury St. Edmund's, the last afterwards changed into a monastery. Southwell Minster is attributed to King Edgar, or more correctly Eadgar, about 958. An era of monastery founding and conversion of churches of secular canons into monasteries followed. But sporadic collegiate churches were being founded right up to the Conquest, among the latest being St. Martin's-le-Grand, London, and Holy Cross, Waltham, founded by King Harold when earl in 1060. Now it is true that of all these in only two is there direct evidence of schools attached to them before the Conquest, Warwick and Waltham. At Warwick a royal writ of the year 1123 of Henry I, confirmed to the Church of All Saints the school of Warwick (*scolas Warwici*, the word "school" is nearly always in the plural up to the Reformation in formal documents) as it was in the time of King Edward, and in the days of his father and brother. At Waltham, a canon expelled to make room for regular canons in 1077, gives an account of the foundation by Harold, who imported a schoolmaster from Liège, whose son, also schoolmaster, taught the historian. But there is a great deal of indirect evidence of schools in many of these places as soon as records begin, not as new institutions, but casually as going concerns. If space permitted, numerous examples could be cited from France and Germany. It is enough to mention the collegiate church of St. Hilaire at Poitiers, at which Hildegard was teaching from 1024 to 1026, when Fulbert, Bishop of Chartres, summoned him there. The synodal decree of Pope Eugenius II, in 826, directing the establishment of teachers in all places where there was a necessity, no doubt included places where there were collegiate churches as being places where schools were necessary. In the twelfth century there are copious references to schools in many of the places mentioned, partly confirmations of the Norman lords, partly owing to the passion of the century for substituting regular for secular canons, the latter now parting with the control of their schools though not without a struggle. Thus at Christ Church, Hants, there appears in 1108 a confirmation to Hilary, dean and the canons of Christ Church, Twynoham, by the Norman lord of all their possessions, including the school of the same town, as they were granted to his father by Henry I, at the beginning of his reign. At Derby, on the other hand, the bishop confirms to the new abbey of Derby about 1153 their possessions, including the school of the same town as granted by William of the April Beard and himself. At Bedford, c. 1160, Nicholas, Archdeacon of Bedford, as a canon of St. Paul's there, in a document en-

tered in the chartulary of the abbey of Newnham "confessed" that "Bedford School (*Scolas Bed.*) which I have held for some time with the consent of my fellow canons is of the right and appurtenant to St. Paul's, and therefore I have voluntarily resigned it to the regular canons of that church," who were afterwards moved out to Newnham.

The old collegiate churches were after the Conquest organized much like the cathedrals, with four principal persons instead of two. So we find at Beverley provost, precentor, schoolmaster, afterwards called chancellor, and sacrist or treasurer; and the schoolmaster appears about 1100 as the hero of a tale which results in St. John of Beverley miraculously curing him of his love for a pretty girl he had seen in church. In the fourteenth century, when its earliest chapter minute book begins, we find copious references to the grammar school, the chancellor appointing the master as usual, and the chapter confirming his monopoly of school keeping in their liberty, which extended for three leagues round the minster. The master had, it appears, the right of creating bachelors in the school. So at Ripon and Southwell as soon as the chapter books are extant the schools appear: the grammar school under the chancellor's, the song school under the precentor's patronage.

A good many new collegiate churches were created just after the Conquest, such as that at Hastings, where a collegiate church was founded in the new castle; and the grammar school was placed under one canon and the song school under another, who are named. At Pontefract it is not clear whether it was a wholly new creation, when, in the time of the first Norman Archbishop of York, a Laey granted the school of Kirkby-Pontefract to the collegiate church of St. Clement in the castle which he had founded. There were not many additions made to the number of collegiate churches during the twelfth and the first half of the thirteenth century, the various new orders of Cluniacs, Cistercians, Augustinian canons, and friars being more in fashion. But about 1260 a revulsion in favor of the colleges of secular clergy took place, and thenceforward to the Reformation no quinquennium, perhaps no single year, passed without an addition to their number, — especially if we include, as we ought, the colleges (*q.v.*) at the universities, — and therefore to the number of schools. There was an even greater destruction of their records at their dissolution in 1547 than there was of the monasteries seven years before. But enough remains to show that whether we look to Howden in Yorkshire, founded about 1266, to Auckland in Durham, founded in 1283, to St. Thomas of Glasney in Cornwall at Penryn, founded or enlarged in 1267, to Ottery St. Mary in Devonshire, all foundations of bishops, or to Mettingham, Suffolk, founded in 1344 by John Walter of Norwich, to Stoke-by-Clare, Suffolk, founded in

1119 by Edmund Earl of March, to Fotheringay, founded in 1447 by Edward of York, or to Brecon College, founded by Henry VIII in 1542, in all of them we find a grammar school and a song school part of the foundation. Mettingham, it is true, seemed by 1404 to have discharged its duty vicariously by boarding scholars at Beeches to attend the school there. But this was exceptional. It may be assumed that where there are no statutes or accounts extant to prove the existence of the schools, they did not exist. The only difference between those later collegiate churches and the older ones was, that they were not as a rule endowed with such great estates. But that was chiefly because the early ones were endowed when land was still at prairie value. In these newer colleges the members were called chaplains or fellows instead of secular canons. The returns to the chantry commissioner at the dissolution in 1547 show that most of them did their duty of school keeping effectively. The Act of Dissolution provided for the continuance of the grammar schools of collegiate churches, and commissioners were appointed to assign lands out of the dissolved colleges for the support of the schools, and "meanwhile" to continue to pay the masters the stipends they were then receiving. Unfortunately some colleges were dissolved under the Monasteries Dissolution Act of 1540, which contained no such provision. Unfortunately also the treasury of Edward VI was in such straits that in the large majority of cases the "meanwhile" became always, the interim order was not followed by a permanent grant, and the stipends of £6 or £10 or £12 a year, which were not had pay in 1547, by 1600 became meager, and by 1700 nothing. The accounts of the Crown revenues for the various counties show most of these payments duly made and the schools fairly flourishing up to the reign of Charles II, and some are still paid at the original rate. But of the two hundred or so collegiate grammar schools existing in 1547 few have survived to our day as efficient secondary schools. In some cases, later benefactors came to rescue. Most have either dwindled into elementary schools or exhibition funds in secondary schools, or have disappeared altogether. Thus while Christ Church, Hants, Waltham, Fotheringay, Stoke-by-Clare, and Mettingham schools have disappeared altogether, and some of the others which it would be invidious to mention barely struggle on, Beverley and Tamworth are doing modest work, not perhaps in the same relative position as before, but Ripon and Warwick and Derby are still flourishing on the same endowments as they enjoyed a thousand years ago. Leicester, with new endowments, is extremely successful as a local school, while Bedford, thanks to obtaining at the dissolution an endowment from lands belonging to a Carthusian monastery, the London Charterhouse, now flourishes in the forehead of the morning sky as one of the great public schools, with a girls' school

equally successful, and second grade and elementary schools attached. But this single instance only emphasizes the loss which others suffered by not being reëndowed, as intended in 1547.

A. F. L.

**COLLOQUIES, COLLOQUIA.** — A term which Brinsley anglicizes in the plural as *Colloquiums*, applied particularly to Latin textbooks in dialogue form. Before the invention of printing, oral methods of teaching ruled supreme, and the conversational method was therefore a natural survival when textbooks were printed. The *Colloquia Scholastica* in Latin and Greek date back to Roman times. In the tenth century there is a *Colloquy* of Archbishop Ælfrie (*q.v.*) and his pupil Ælfrie Bata, consisting of conversations in Latin and Anglo-Saxon between the teacher and all sorts of people, such as the scholar, plowman, shepherd, hunter, fisher, merchant, shoemaker, smith, and so on, each describing his occupation.

Catechisms (*q.v.*) are a specialized form of the colloquy, namely, a dialogue between master and pupil with a view to the shortest and most exact exposition of the main points of the subject in matter of instruction. But the colloquy proper — the Renaissance and post-Renaissance colloquy — was the special method for direct early instruction in Latin speaking. The two classical works earliest taken in the grammar school were Cicero's *Epistles* and selections, and Terence's *Comedies* — because these formed suitable introductions to the phrases for familiar intercourse in Latin speaking. As early as 1528 Cardinal Wolsey, in his directions to the headmaster of Ipswich grammar school, required special attention to be paid to Terence, and in repeating the words of the speakers in the scenes, the boy was to be made to speak "with all possible correctness." But Cicero's *Epistles* and Terence's phrases in the plays were an incomplete equipment for Latin speaking. They required supplementing — firstly, because they contained much that was not essential for the earliest stages of Latin speaking, and secondly, and chiefly, because, being written with aims quite apart from the educational use of later ages, they did not contain the subject matter of the ordinary conversation of the sixteenth century; and if Latin was to become, as the Renaissance writers fervently desired and expected it to become, the universal learned language, it was necessary that fluency should be cultivated in school pupils, on all the topics likely to arise in all their daily life and pursuits, both in and outside the school. For this purpose the *colloquia* were written to remedy the defect, which it was impossible to supply from purely ancient classical sources. Further, though Latin speaking had prevailed in the medieval schools, it had degenerated too often into barbarous "dog-Latin," and it required a constant struggle of the Renaissance scholars to suppress the survivals of the old, incorrect

vulgarisms, the *sordida verba*, which everywhere abounded. Accordingly the best scholars often turned their energies into providing *colloquia* in which correct Latin, founded as nearly as possible on the model of Cicero and Terence should be used. Hence the two *desiderata* of the *colloquium* were (1) correct Latin, so as to reform all ancient barbarous words and expressions; (2) familiar subject matter, so as to make the colloquy a really useful textbook, giving the Latin words and phrases to describe what was most needed in conversation, so as to bring pupils to the position of being not only pure, but also fluent Latinists. From the historical point of view, these considerations are now altered in order of importance. The colloquies are for us of prime significance because they reveal the details of the everyday life and environment of teachers and pupils, — school life, university life, as well as home life, — the interests of boys and girls, their relations to each other, their aspirations, their success and failure, their attitude to the academic, learned, social, religious, ethical, and even political atmosphere of their times. They may be regarded as valuable, educational historical documents.

The first of the series of Renaissance colloquies is the *Manuale Scholasticum*, composed between 1476 and 1481, containing dialogues between university students at Heidelberg. The most outstanding examples of collections of colloquies are probably those of Erasmus (*q.v.*), Petrus Mosellanus, Vives (*q.v.*), Castellion (*q.v.*), and Maturin Cordier (*q.v.*) (Latinized as Corderius). Erasmus' *Colloquia* (first edition 1519) have been read continuously since their appearance, because they abound in sly humor and recall the spirit of the times. Some of his colloquies seem rather devised for adults than for children or youth, but *Select Colloquies* have been edited for the schoolroom, even down to an edition which appeared in 1908 from the University Press, Cambridge, England, edited by G. M. Edwards. Moreover, Erasmus himself states that some of the colloquies were especially written by him for "backward pupils." The colloquies of Peter Mosellanus, called the *Pædagogia* (1518), though less well known than those of Erasmus, give a clever account of academic life, offering the conversations in Latin of students at Leipzig, giving graphic accounts of the "poor" students, almost at their wits' end to ward off starvation and getting the wherewithal to live and study by food from rich men's tables, by begging, or by awaiting the time of the great Fair, when merchants came from the locality of their homes bringing home supplies, or patron's subsidies. The recklessness of the students on receiving help — in at once spending lavishly on beer, and amusements, such as the circus — is vividly portrayed. The school colloquy was further developed by Vives (*q.v.*) in his *Exercitatio* (1539). He depicts, by boys' conversations, life in the home, the boy with his brothers

and sisters at play, on the way to school, in school, and the topics interesting him there. All the surroundings of the boy's life find a place, the building of a new house and a tour in it from top to bottom, a cookshop and kitchen in the boy's town. There is a description of a royal palace, and an account of the prince's education (Philip of Spain, who afterwards married Queen Mary of England). A love of nature bursts out at times, as, for instance, in a horseback journey on a holiday. There is much humor, literary aspiration, the Renaissance spirit, but it is an inspiring boy's book. Castellion (*q.v.*) (Latinized as Castalio) published his *Dialogues Sacrés* in French and Latin in 1543. By this time the Protestant Reformers were intent on continuing the teaching of Latin with subject matter of a religious nature in accord with Reformation views. Castellion's *Dialogues* are entirely Scriptural in topic; the most important incidents of Scripture history are studied from the boy's point of view. The book was very popular, both on the Continent and in England. It was an excellent introduction to the Bible histories, and was written in good Latin. The *Colloquia* of Maturin Cordier (*q.v.*) (Corderius) was published at Lyons (1564), but was the product of Corderius' long schoolmaster's life in Paris, Bordeaux, Geneva, stretching over a period of sixty years' observation of boys. The *Colloquia* throughout describes schoolboys' life. It is the most comprehensive account of boys obtainable for the seventeenth century. They are mainly Genevan boys — but they stand for the Puritan boy throughout Europe. The *Colloquies* show in incomparable wealth of detail the action of Calvinism on the home and school life, and the reaction of its religious and ethical doctrines on boys' natures. They supply details of schoolmasters' aims and methods, and give a familiarity with the psychological aspects of teacher and taught. Though they disclose Calvinistic rigor, there is a love of children intermixed, for a parallel to which we must pass forward to Pestalozzi. The pictures which are presented of the various types of children gathered in the educational center of religious refugees at Geneva makes the book varied and valuable. It is unique in its presentation of the aim to transfer the idea of a theocracy into the school. It is not, perhaps, too much to say, that as a school textbook in English grammar schools, for the younger classes, Corderius' *Colloquies* was second only in its extensive use to the Bible and the Catechism, during the first half of the seventeenth century.

Colloquies were extant in the eighteenth and early nineteenth centuries, but the subject matter changed to general information, and elementary scientific instruction. They were written in the vernacular, and became scrappy and fragmentary. They lost the old interest of the sixteenth- and seventeenth-century type. The instructional side of the old colloquies was

directed to the acquisition of Latin as a spoken language. The subject matter, therefore, was necessarily concerned with all that appealed to the interest, the humor, the surroundings, and the nature of the child. They therefore had a keen human side. In many ways, they afford suggestions for the direct teaching of language to-day, *mutatis mutandis*, and for the historical student, they disclose the subjects which were considered by experienced teachers to be of interest to the children of those centuries.

**COLOMBIA, EDUCATION IN.** — Colombia, republic, area about 500,000 square miles; population, 4,303,500. Capital, Bogota, population, 100,000.

By the constitution of 1886 the sovereignty of the former states of Colombia was abolished and the departmental system adopted, similar to that of Bolivia. The chief executive or governors of the departments (11 in number, law of Dec. 10, 1909) are appointed by the President. While the local administration is thus closely tied to the central authority, the departments have retained the independent management of their financial affairs. Although education has been officially recognized by the organization of a ministry of public instruction, on account of the repeated revolutions and general internal disorders, little progress has been made in the work of establishing public schools. Religious liberty is assured by the constitution, but the nation is Roman Catholic, and the Church and its auxiliary agencies, the teaching orders, have practically controlled education.

In 1906 public education was represented by a few primary schools in the cities, which are gratuitous and supported by municipal funds, and by normal schools in five departments maintained by departmental appropriations. Secondary education was conducted almost exclusively by church schools, which included elementary divisions. As a rule these schools are subsidized from the public treasury. The total attendance at the various schools and colleges was estimated to be about 219,000.

In the year to which the above statistics relate, *i. e.* 1906, the Minister of Public Instruction was authorized to formulate a plan for the complete reform of public education with a view to adapting it to the practical demands of the

nation. The main provisions of the measure recommended by the minister and eventually adopted by both chambers of the legislature are as follows: "Primary instruction shall be maintained by public funds. It shall be gratuitous, but not yet compulsory. It shall be placed under the care and direction of the provinces, but subject to state inspection. Secondary instruction shall be in charge of the State, but the cities and the provinces may establish or subsidize secondary schools. Industrial and technical instruction shall be provided at the expense of the State in the federal capital and at the expense of the provinces in the other cities."

The committee reporting the bill emphasized its importance as follows: "It is in the schools, in the colleges, the technical institutes and in the workshops for training apprentices organized in accordance with rational methods and directed toward truly practical ends that we may find the germs of national elevation. To bring education into accord with actual necessities, that is to say, to propose as its aim some positive objects such as the exploitation and the culture of the immense territory of Colombia, or the development of the crude resources and of manufactures; this ought to be before all else the controlling principle of public instruction designed for a country which has been so long a victim of its taste for speculative studies, for theories, and for chimeras." These words express a pressing need not alone of Colombia, but of the other states which were included within the limits of the former Republic of Colombia when its independence of Spain was declared. At the present moment, then, the educational problem before the government is that of readjusting the traditional scheme of secondary education, since it is in the schools of this order that the directive classes are trained. The work of readjustment has already begun in individual colleges and in the normal schools that have been established in the most progressive departments.

Higher education was formerly represented at the capital by faculties of letters, philosophy, jurisprudence, and political sciences, on the humanistic side; and by faculties of natural science, mathematics, and engineering on the scientific side. The last named faculty is replaced by the mining school opened at Zipaquira. The faculty of natural sciences is continued as an adjunct of the faculty of medicine.

**COLONIAL EDUCATION.** — See INDIA, EDUCATION IN; COLONIAL PERIOD IN AMERICAN EDUCATION; FRENCH COLONIES, EDUCATION IN; PHILIPPINE ISLANDS, EDUCATION IN; and the articles on the various colonial dependencies.

**COLONIAL PERIOD IN AMERICAN EDUCATION.** — The colonial period may

well be called the period of transplanting; but with greater exactness, the period of transplanting ends about the middle of the eighteenth century. By that time there has begun reconstruction of the educational system to meet a new social consciousness. For detailed treatment of the educational history of the several colonies, the reader is referred to the accounts of the respective state systems given under the names of the thirteen original states. Here we are concerned with comparisons among the colonies and with topics more or less common to the region as a whole.

**Foundations in English Legislation.** — England had no specific educational legislation of a kind to influence the colonies. But by 1601 there had been developed, especially in poor relief laws and apprenticeship legislation, certain principles of law from which colonial legislation on education takes its departure. It has been estimated that in the time of Elizabeth about one half of the population of England had not sufficient income to supply actual sustenance. To meet this situation, a series of acts, culminating in 1601 (43 Eliz., c. 2), were passed designed to regulate the labor of the poor and to fasten upon the rich the necessary poor relief. The following provisions in these acts, as will be seen, influenced American school legislation. (1) The compulsory apprenticeship of all youth not of independent living; (2) the obligation of the master to train his apprentices in his trade; (3) the obligation upon the overseers of the poor to supply, wherever necessary, the materials and opportunity for this training, pay the apprenticeship fee, for example; (4) compulsory assessment of rates on all ratable persons to provide the funds necessary to these ends; (5) The excessive burden of any one parish may be shared by others of the hundred or the county. The significance of these for education appears especially in the recognition of the rights of the State, first, to give needed training to the poor youth by assessed rates upon all, and, second, to distribute the excessive burden of one parish throughout the hundred or county.

In this connection it is well also to point out the evolution of compulsory assessments for poor relief: (1) voluntary contributions (1553); (2) voluntary contributions, if possible, forced, if necessary (1563); (3) assessment, if desired by local authorities (1572); (4) compulsory assessments of all ratable persons (1601). These principles and methods of procedure, as developed just prior to the period of colonization, form the basis of colonial legislation in the more distinctive field of education.

**Educational Legislation in Virginia.** — The first founded of the colonies, Virginia remained throughout the colonial period in mental attitude most like the mother country. The general legislative enactments refer either to William and Mary College, on the one hand; or, on the other, to orphans, or to the poorer

classes. The English spirit is evident. In this, Virginia stands among the colonies as the clearest example of one type of attitude toward school support and control. In 1643, orphans are to be educated "according to the competence of their estate." In 1646, "if the estate be so meane and inconsiderable that it will not reach to a free education, then that orphan (shall) be bound to some manuell trade. . . . except some friends or relatives be willing to keep them." In an act of 1660-1661 the English precedent is explicit. The example is invoked of "laws and statutes by act of Parliament . . . for the education of youth in honest and profitable trades." "To avoid sloth and idleness . . . as also for the relief of parents whose poverty extends not to giving (their children) breeding . . . the justices of the peace should . . . bind out children to tradesmen or husbandmen to be brought up in some good and lawful calling." Since some parents object to this, it was provided that the "commissioners of the several counties . . . make choice of two children in each county . . . (to) be sent to James City . . . to be employed in the public flax houses under such masters and mistresses as shall be appointed." It was further deemed "fit that the commissioners have caution not to take up any children but from such parents who by reason of their poverty are disabled to maintain and educate them." The presence is to be noted here of all five of the English provisions pointed out above: compulsory apprenticeship of the poor, training in a trade, obligation of public authorities to provide opportunities for this education, both local and general funds used, — all, as the act states, "according to the aforesaid laudable custom in the Kingdom of England." In 1705, "the master of the (apprenticed) orphan shall be obliged to teach him to read and write"; a provision that Massachusetts, breaking from England, had made for all children some sixty years before. But in Virginia the indifference of the mother country to popular education was continued without change. As in England, the controlling influences were aristocratic; and diversities of population forbade free social commingling. Moreover, had a common school system been desired, the large plantations "with houses far asunder," would all but have prevented it. Tutors and small private schools, or education in England, prevailed for the better to do. The less fortunate were left to their own devices. Virginia stood as the type of the *laissez faire* policy with reference to the support and control of public education.

**Educational Legislation in Massachusetts.** — The opposing type is Massachusetts, the best example of governmental activity in school matters. Here two elements commingle: on the one hand, the common heritage of English law and procedure; on the

other, the religious consciousness of extreme Protestantism. (See CALVINISM AND EDUCATION.) In whatever countries this religious attitude had been present, the leaders had included in their scheme of reform some conception of general education. It need not then be cause for surprise to find this Puritan ideal early seeking embodiment in legal form and principle that is English in its origin. This step appears in the act of 1642, which is, on the whole, a Puritan adaptation of the English laws already reviewed. "The neglect of many parents and masters in training up their children in learning and labor" is the occasion of the law. "The chosen men," as the English overseers of the poor, "charged with the redress of this evil," are empowered "to put forth (as) apprentices the children" of all who are "not able and fit to bring them up." "They are also to provide a sufficient quantity of materials as flax, hemp, etc. . . . for working out the same." In this American reproduction of the English apprenticeship law are repeated, explicitly or implicitly, four of the five English provisions already noted. But to them is added that significant contribution of the Protestant religious consciousness: the chosen men in their oversight of the children shall "take account . . . especially of their ability to read and understand the principles of religion and the capital laws of this country." For the first time in the English-speaking world does a competent legislative body require that all children shall be taught to read. Out of the English poor law, America takes its first step toward state control of education. The act does not establish schools; and the religious motive is to be left behind in educational progress; but the gain to education is accomplished, and the future is to build on it.

The act of 1647 comes next. To base it, even in part, on English poor law seems hardly warranted. Nor does the 1642 act of itself furnish a sufficient foundation. The religious consciousness is uppermost: "It being one of chief point of that old deluder Satan to keep men from the knowledge of the scriptures." The schools are primarily for the clergy, that they may have "the use of tongues," and so avoid the "false glosses of saint seeming deceivers." Back of the act may be safely assumed the general example of European Protestantism. There has as yet been adduced no proof that the *First Book of Discipline*, or other Scottish educational activity, had any determining influence. However much education is again indebted to religious zeal, its gain remains assured. "Every township of fifty householders . . . shall . . . appoint one within their town to teach all such children as shall resort to him to read and write. . . . Where any town shall increase to the number of one hundred families or householders, they shall set up a grammar school,

the master thereof being able to instruct youth . . . for the university." A second great step is now taken. Not only is a school system built; but for the first time in the English language is there a legally valid assertion of the right of the State to require of local communities that they establish and maintain schools of general learning. The "commonwealth" is mentioned along with the "church" as a beneficiary of the act. In the light of subsequent development it can safely be said that these two Massachusetts acts of 1642 and 1647 laid the foundation of the American public school system.

*School Rates in Massachusetts.*—This method of school support is closely connected in its rise with the act of 1647, and is hardly less significant. There was, in the case of English poor relief, an evolution from voluntary contribution through compulsory contribution to rate assessment. The same evolution in the case of the support of the ministry and of the schools took place in Massachusetts.

*School house & Watch House 1648, Dedham, Mass.*

In 1634 the towns were authorized to use rates for all public charges. The application of this, however, to the support of the ministry was by some objected to on theoretical grounds; while its application to the schools was as yet too novel to gain an early acceptance. In the case of the former, Salem shows concisely the three steps of the evolution: 1639, "a voluntarie towne contribution towards the maintenance of our ministry"; 1657, "all those persons that will not subscribe nor contribute towards the mayntenance of the ministry shallbe rated and the selectmen to rate ym"; 1659, "ordered that those sumes for the ministry shall be raised uppon the town by way of rate." In the case of school support, the 1647 act bears specifically. The schoolmaster's "wages shall be paid them by the parents or masters of such children, or by the inhabitants in general . . . as the major part of those that order. the prudentials of the town shall appoint." The towns may choose, and every possible arrangement appears in the records. The necessity of the care of the poor in these schools forced upon the town some part of the schoolmaster's salary. The penalties attending any disregard of the 1647 act made the town, at times, painfully conscious of its responsibility. These two elements as spurs to the democratic sense of the community probably account for the universal acceptance of the tax levy as the proper means of school support. Dr. Jackson's exhaustive study of twenty-one towns, for which records are available, shows, among other things,

(1) that of the six towns whose records of support antedate the 1647 act, all but one are, when the records begin, using the method of contributions, at least in part. (2) That the custom was in Boston and other towns at a later date (1645) to pay "the yearly charge of the school by contribution either by voluntary allowance, or by rate of such as refused" (Winthrop's history). (3) That by 1761 under the pressure of the penalties of the 1617 act only one of the towns studied was still using tuition. (The median date of rate adoption was 1715.) Rates and other publicly derived funds had supplanted all other means of school support. When it is recollected that England did not, until the latter part of the nineteenth century, assume the responsibility of furnishing education free to all, we can the better recognize the significance of this achievement of colonial Massachusetts.

**Church School Systems in New York and Pennsylvania.**—The Dutch in New Netherland, New York, and the Germans of various sects in Pennsylvania brought with them to America a school tradition and custom so different from those previously studied in Virginia and Massachusetts as to constitute a third type of attitude toward the problem of school control and support. The Quakers developed much the same system both in Pennsylvania and elsewhere, and will accordingly be included in the same discussion. The characterizing feature of this type is found in the close connection between the Church in its organic capacity and the school. The New Netherland schoolmasters sent out by the West India Company were first certificated by the Reformed Dutch Church authorities in Amsterdam. The public schoolmaster in New Netherland held *ex officio* the positions of reader (*voorleser*) and precentor (*voorzanger*) in the particular church with which the school was connected; and "in case of the sickness or absence of the minister . . . must read a sermon for the edification of the congregation." The common prayers and the catechism formed part of the school curriculum. When, in 1771, the Reformed Dutch churches in America formed an assembly of their own, it was reënacted that "the respective congregations shall hereafter make it their business to establish schools . . . under the direction of the consistories"; and "everywhere the consistories shall see to it that there are good schoolmasters. . . ."

Substantially the same seems to have been true of the Pennsylvania Germans. It appears from the records of the Lutheran churches in Pennsylvania that "each congregation . . . established a congregational school alongside of the church, at the earliest possible period after its formation." And the same appears to have been true of all the other sects. The closeness of the connection between church and school may be inferred from a 1747 contract:

"I, the undersigned John Hoffman, parochial teacher of the church at Lancaster, have promised in the presence of the congregation to serve as chorister, and as long as we have no pastor, to read sermons on Sunday. In summer I promise to hold catechetical instruction with the young, as becomes a faithful teacher, and also to lead them in singing and to attend to the clock." While the ecclesiastical machinery of the Quakers was not so strong as that of the other sects, their interest in parochial education was not less active. In 1722, at the yearly meeting of Friends for the Province of Pennsylvania and New Jersey, it was set forth that "Our advice is that all Friends' children have so much learning as to read the holy scriptures and other English books, and to write and cast accounts . . . and for that end let the rich help the poor." In 1746: "We desire you, in your several monthly meetings to encourage and assist each other in the settlement and support of schools"; and this is many times repeated in subsequent years. See FRIENDS, EDUCATIONAL WORK OF.

When it is recalled that in 1760 out of a total population of 250,000 in Pennsylvania, the Friends were estimated at 50,000 and the Germans at 90,000, the part played by these parochial schools is the better appreciated. In respect of centering attention on an elementary education of the three R's instead of preferring grammar schools, as was done for the most part elsewhere, and in respect of educating girls as well as boys in these schools, it might readily be admitted that to this type belongs the credit for approaching at this early date most nearly to the modern idea of an elementary school. But this does not mean that the American public school came from this source. Not only does the history of the present public schools show another origin; but it must be admitted that in Pennsylvania at least the parochial system by its positive opposition delayed the acceptance of the public school idea.

**General Characteristics of the Colonial Systems.**—Maryland may be considered as presenting a fourth type proposed but not developed, that of a county system of free schools supported by general colonial taxation. The colonies not already considered group themselves about one or the other of these types. Connecticut and New Hampshire follow the example of Massachusetts. Rhode Island, New York, New Jersey, Delaware, and North Carolina follow the English attitude as exemplified by Virginia. South Carolina's legislative history, had it been followed in practice, would have given a fifth type, namely, the legislative establishing of a system of parish schools. In 1712 appropriations were offered toward building a schoolhouse in each parish under the direction of the established church (the Church of England), and for a schoolmaster's salary,

Apparently little was done in response to the offer. Afterwards, in 1722, a system quite similar to that of Maryland (1723), was authorized. The justices of the several county courts were to establish a "free school" (Latin grammar) in each county and precinct, levying a local tax to pay for the schoolhouse, while the state offered a salary of £25 for the schoolmaster. But this too came to nothing. In practice, South Carolina followed closely in the footsteps of Virginia. Georgia, founded much after all the others, and long unprosperous, enjoyed the unique experience of having the Parliament of England provide the colonial budget, including the salaries of two schoolmasters. This was continued until the Revolution.

Thus in colonial days were laid the foundations of the present American public school system. The following principles not previously explicit in English practice were embodied in actual systems prior to the Revolution: (1) The right of the State to require the education of all its citizens (Massachusetts, 1642). (2) The right of the State to compel local civil divisions to establish schools (Massachusetts, 1647). (3) The right of the local civil division to support schools of general education by a tax levy on all ratable persons (Massachusetts practice, practically universal prior to 1750). (4) The right of the State to appropriate state funds to a general system of schools (Maryland, 1694).

**The Schools from Within.** — We turn now from the administration of colonial education to the schools themselves. In England, at the time of the colonization, three distinct schools divided what are now considered the fields of elementary and secondary education: the petty (dame) school, teaching spelling and reading, and less often writing; the grammar school, which taught Latin and Greek "grammar"; and the writing school, in which the boy studied writing and "arithmetic or merchants' accounts." The curricula as here given were not invariable. The types, however, were fixed. Brinsley (*q.v.*) complains that the grammar school was often "troubled with teaching A B C," while a boy could depend on the incidental writing of the grammar school and not attend the writing school. In such case he might reach the university scarcely able to tell the numbers of pages or read the dates of chronology. The grammar school was the important school. The petty school either prepared for it, or gave a modicum of training to those who were not to be liberally educated. The writing school, tending to be commercial in its outlook, was parallel to the grammar school. In London grammar pupils usually went "at eleven and five o'clock to the writing schools." In the country itinerant masters taught writing in the grammar schools.

These three schools were brought to America,

but owing to the exigencies of a new country, were not often found distinct. Until 1750, wherever the parochial or town schools did not prevail, the grammar school was the principal concern of educators and school legislation. The writing school is seen in the identical resolutions of Boston and Braintree, 1682 and 1683, respectively, to establish "one or more Free Schools for the teaching of children to write and Cypher."

*This is to give NOTICE,*

**T**HAT the Subscribers hereof, living in the Township of East-ham, Burlington County, and Province of West Jersey, do want a Schoolmaster, and shoud to have a single Male such Person applying, qualified for the said Service, to receive good Wages, and good Treatment, by us.

© ABRAHAM HAINES, and THOMAS SMITH, Senior.

Advertisement of a Colonial School, from the *Pennsylvania Gazette*, November 22, 1759.

Each town already had a grammar school. An early record of the dame school is in Springfield, 1682, where "Goodwife Mirick" is "teaching children to read" at "three pence a week for every child." Before this at Newbury in 1653, the petty school is implied in the record that pupils attend the "free school" "so soon as they know their letters and begin to read." In Brookline, where in 1710 there was no grammar school, the town determines on both the other types, "a good dame" (evidently to teach reading), and a "Master" "to teach to write and Cypher." The same year in Charleston, S.C., in addition to the "master" of the "free school," a "fit person" was to be appointed "to teach writing, arithmetic, and merchants' accounts," a combination of types which the Maryland acts contemplated. In the greater number of cases there is seen a tendency to combine two or more of the types so that one master could meet the more insistent demands. In the two decades in New England immediately following the 1647 act the schools most frequently found are (1) those that teach reading and writing, and (2) a grammar school which gave instruction also in reading, writing, and ciphering. Later than this the elementary school takes up the ciphering and becomes the school of the three R's, a curriculum which was more frequently in the Dutch, Quaker, and German schools. In the reading school, the first book might be a hornbook (*q.v.*), or quite probably a primer. There were many primers, of which the New England was the most common. The second book was usually the psalter, and then came the Testament or Bible. The newspapers regularly advertise, "Testaments, Psalters, and Primers." In arithmetic, for most of the colonial period, the master commonly dictated "rules" and "sums," these forming a MS. arithmetic, many of which have come down to us. Later, textbooks, such as Fisher's, Hodder's, Cocker's, and Dilworth's, were increasingly used. English grammar, history, and geography were not taught

till the latter part of the colonial period, when the educational outlook begins to change.

The grammar school took the boy at about the age of eight. The first book was the *Accidence* from which the declensions and conjugations were learned. Cheever's book was the most popular, though Brinsley's and Hoole's were also used. The second book might be the *Confabulatiunculae Pueriles*, Cato's *Distichs*,

able to read Tully or such like Latin Author extempore and make and speake true Latin in verse and prose without assistance, and decline perfectly the paradigms and nouns and verbes in ye Greeke tongue, then may hee bee admitted into ye College, nor shall any claime admission before such qualifications." (See COLLEGE REQUIREMENTS FOR ADMISSION.)

In the Middle and Southern colonies commercial demands early made themselves felt. Chaplain Sharpe complains in 1713 of New York that the people are "so inclined to Merchandise that they generally seek no other education for their children than writing and arithmetic." Already (1712) Charleston, S.C., had provided in its free school "or academy" "a fit person" "to teach writing, arithmetic, and merchants' accounts, and also the art of navigation and surveying and other useful and practical parts of mathematics." The New York "Public School" of 1732-1739 advertised to teach "all the Branches of the mathematics, geometry, algebra, geography, navigation, and merchants' book-keeping." These are the forerunners of the new era to be ushered in by Franklin's Academy of 1749. (See ACADEMIES.)

Everywhere and at all times in the colonial period the religious element was prominent in the schools. Reference has been made to the use of the Psalter and Testament as textbooks. The primers were filled with the religious ideas of the time. Every school taught the catechism. Not only did the parochial schools require church attendance of their pupils, but the grammar schools as well compelled their pupils to report each week on the Sunday sermon.

Many of the schoolmasters were men of considerable worth. Francis Daniel Pastorius of Germantown was probably the most learned, as Ezekiel Cheever (*q.v.*) was the most famous. Christopher Dock (*q.v.*), the Mennonite, wrote in 1750 the first American book on school management. During the eighteenth century suitable schoolmasters were hard to obtain. Tutors for the wealthy families of Virginia and the South were generally brought from England and Scotland; toward the Revolution from the North. Many of the ordinary teachers in the Middle colonies and Virginia were probably servants. The Society for the Propagation of the Gospel (*q.v.*), wherever it operated, furnished an excellent body of schoolmasters. Some of the towns about New York City particularly profited by them.

**Education of Girls.** — It will be evident that in the opinion of colonial America learning did not properly belong to women. Reading was demanded, writing desired, a little arithmetic might be studied. Beyond this woman seldom went. As has been said, the parochial schools were generally, perhaps invariably, open to girls. The Penn Charter School from the first (1698) admitted "all children and

Whoever takes up said Servant  
 Work Houfe, shall have Twenty Shillings Reward and all  
 reasonable Charges paid  
 By Andrew Bradford.

A Type of the Colonial Schoolmaster: from the *American Weekly Mercury*, Philadelphia, 1735.

or the colloquies (*q.v.*) of Corderius, Vives, or Erasmus (*qq.v.*). Castellion's (*q.v.*) *Dialogi Sacri* was frequently used. Lily's grammar would follow Cheever. The authors read varied much, but the aggregate differs little from a modern list. Much attention was paid to writing Latin, for which Clarke's *Introduction* was much used. Verse-making did not thrive on American soil. The speaking of Latin was demanded theoretically. At the grammar school of William and Mary the rule was for the pupils "at all times to speak Latin in apt and proper terms," even in "any sort of Plays or Diversions." It may safely be supposed that such efforts were not usually successful. In Greek the grammar was studied, usually Camden's or the Westminster. The New Testament was read, and sometimes Xenophon or Homer or Isocrates. The Massachusetts law of 1647 required the grammar schools of that colony "to instruct youth so far as they may be fited for ye university"; the aim of the New England grammar school may therefore be inferred from the Harvard entrance requirements (1642). "When any Scholler is

servants, male and female"; and this seems to have been the rule with the Quaker schools. The curriculum is shown in the official wish (1772) that "all Friends' children have so much learning as to read the holy scriptures . . . and . . . to write and cast accounts . . . and . . . some useful . . . employment." To what extent this wish was realized in the case of girls we have no means of knowing. Among

**E. ARMSTON** (or perhaps better known by the Name of GARDNER) continues the School at *Point Pleasant, Norfolk* Borough, where is a large and convenient House proper to accommodate young Ladies as Boarders; at which School is taught *Peint Point in Flowers, Frets, Landscapes, and Sculpture, Nuns Work, Embroidery in Silk, Gold, Silver, Pearls, or embossed, Shading of all Kinds, in the various Works in Vogue, Dresden Point Work, Lace Datto, Catgut in different Modes, flourishing Muslin, after the newest Taste, and most elegant Pattern, Waywork in Figure, Fruit, or Flowers, Shell Datto, or grotesque, Painting in Water Colours and Mezotinto; also the Art of taking off Foilage, with several other Embellishments necessary for the Amusement of Persons of Fortune who have Taste. Specimens of the Subscriber's Work may be seen at her House, as also of her Scholars; having taught several Years in *Norfolk*, and else where, to general Satisfaction. She flatters herself that those Gentlemen and Ladies who have hitherto employed her will grant her their farther Indulgence, as no Endeavours shall be wanting to complete what is above mentioned, with a strict Attention to the Behaviour of those Ladies intrusted to her Care.*

Reading will be her peculiar Care; Writing and Arithmetick will be taught by a Master properly qualified; and, if desired, will engage Proponents in Music and Dancing.

A Colonial School for Girls: from the *Virginia Gazette*, March 5, 1772.

the Germans it was likewise the rule for girls as well as boys to attend school. Christopher Dock arranges a class, "the boys together on one bench and the girls on another by themselves." His curriculum is spelling, reading, writing, and ciphering. The Moravians under Count Zinzendorf in 1742 opened a boarding school of 25 girls at Germantown; and in 1749 another for older girls at Bethlehem. This latter school is now in existence, probably the oldest girls' school in America. The average attainment of the German girl may be inferred from a statement made in 1789 by Dr. Rush: "There is scarcely an instance of a German of either sex in Pennsylvania that cannot read; but many of the wives and daughters of the German farmers cannot write."

In New Netherland, while the data are not very explicit, the evidence is strong that girls as well as boys attend the church schools. A widow, upon a remarriage, signed in 1642 the usual marriage contract "to keep them [four girls and a boy] at school, to let them learn reading, writing, and a good trade." The words "reading, writing, and a good trade" occur over and over again in similar contracts and in wills, sometimes referring to girls alone, sometimes to boys alone, sometimes, as here, to both. Sometimes, when a girl is named alone in one of these contracts, sewing is added. Unfortunately, however, we again cannot suppose that writing was an invariable accomplishment. The signatures of women that have come down to us from the Dutch period show a large number of marks made. It is interesting that the only public school of colonial New York City

open to "children of what age and sex soever" was one which followed and continued "the city school" of New Amsterdam. It is unfortunate, but significant, that public support of a coeducational and municipal school could not long survive in the new situation of English control.

In New England all children must learn to read (act of 1642); but women should (Governor Winthrop) attend to "household affairs" and not "meddle in such things as are proper for men whose minds are stronger." These doctrines are explicit in the Hartford court decision of 1655 that certain administrators should "educate the children, learning the boys to read and write, and the daughters to read and sew." This discriminative precedent is followed in other court decisions and in legal apprenticeships. The discrimination appears also in the schools of the period. The New Haven Hopkins Grammar School states the rule for the others of its kind: "that all girls be excluded as improper and inconsistent w<sup>th</sup> such a Grammar School as ye law enjoins, and is ye Design of this settle<sup>mt</sup>." With regards to those lesser masters' schools which taught the three R's, the same rule held on the whole. The exceptions were until late in the period confined to the small towns: Hampton, N.H. (1649), Rehoboth, Mass. (1689), and Manchester, Mass. (1724) admit "both sexes of girls and boys to read English, write and cast accounts." Just how many towns did allow girls to attend such schools cannot be determined from the available data. But evidently the number is small. Of some two hundred towns whose records have been studied by Small and others, the present writer can find only eleven which admitted girls prior to 1770. And some of these may have been dame schools, which of course were always open to girls. Some masters' schools, however, began to admit girls without formal action on the question. Thus at Hartford we find no recorded vote to admit girls; but the school lists show in 1695-1699 no girls; in 1700, 4 girls out of 46 pupils; in 1709, 16 girls out of 64 pupils. After the eighteenth century is well open and dames begin to teach the town schools, it becomes more and more the custom for girls to attend the public schools; especially in the country. In the larger places the admission is halting. In 1766 Medford orders its master to "instruct girls two hours a day after the boys are dismissed." And such expedients to teach girls at odd hours and apart from boys become frequent.

For the general condition of girls in the average country schools at the close of the period the statement of Woodbridge as to what he knew personally of rural Connecticut about 1770 may be accepted. "Common schools were open to every child." "Girls had no separate classes, though usually sitting on separate benches." "The branches taught were spelling, reading, writing, and rarely even the

first rules of arithmetic. I have known boys that could do something in the four first rules of Arithmetic. Girls were never taught it." The wife of John Adams (born 1744) probably speaks of a situation somewhat above the average. "Female education, in the best families, went no further than writing and arithmetic; in some few and rare instances music and dancing." Our records for the other colonies are too few to allow extended discussion. In the matter of apprenticeship the English custom seems to have prevailed. An orphan's court in Virginia (1694) stipulates in the case of a girl bound out that the master is "to teach her to read, sew, spin, and knit." The ordinary neighborhood reading schools seem to have been open to girls. The S.P.G. schools, whose curriculum was reading, writing, and ciphering, mention girls, as if customarily present. Of Rowland Jones' pupils (1725) "one girl exceeded all; she had . . . by heart . . . the whole book of St. John." In 1738 Whitefield opened "for the Girls of Savannah" what appears to have been a charity school. Aside from private schools conducted for gain, this was one of the first, if not the first school exclusively for girls in the colonies. The grammar school everywhere excluded girls.

In the education of the wealthy girls who looked forward to social life, most numerous in Virginia and South Carolina, probably the English customs prevailed alike throughout the colonies. Hugh Jones says (1721) of Virginia, "as to the education of girls, it is great Pity but that good Good Boarding schools were erected for them at Williamsburg and other towns." At the same time a girl from the Barbados learned in Boston "to sew, fleure, write, and dance," apparently, however, not at a boarding school. Later, boarding schools were opened in practically all the colonies. Probably in most cases the daughters of the wealthy were taught at home. The tutor for the boys of a family taught the girls reading, writing, arithmetic, and literature (now so called). Special masters taught music and dancing. An Occasional English governess was brought out. Even wealthy mothers oftentimes taught their own daughters. While Charles Cotesworth Pinckney and his brother Thomas were at Oxford and Westminster, their sister was studying in Charleston under their mother: "Harriott pays her comp<sup>ts</sup>; she is much engaged just now with geography and musick." In rarer instances girls were sent to England for their education. William Byrd of Virginia has abroad, at one time (1686 sq.), one son and two daughters. The close of the colonial period shows signs of a new attitude. In fact, a new era dawns at Portsmouth, N.H., in 1773, when the town supports a "Female School." Some eighty girls, from seven to twenty years of age, study reading, writing, arithmetic, and geography. Already the

American interest in the education of women is beginning to make itself felt.

For more detailed discussion of aspects of this topic see the account of education in each of the thirteen original states, also articles on ACADEMIES; CALVINISM AND EDUCATION; GRAMMAR SCHOOLS; COLLEGE, AMERICAN; COLLEGE REQUIREMENTS FOR ADMISSION; WOMEN, HIGHER EDUCATION OF.

**The Close of the Period.**—Toward the close of the colonial period there comes a change of attitude in America. The original religious solidarities, whether of Puritan New England or of the Episcopal South, tend to be broken up. Presbyterian Scotch and Irish enter in great numbers into the Middle and Southern colonies. The "great awakening," under Whitefield and Edwards, brings a more democratic spirit into church affairs, especially in New England and the middle region. Moreover, the colonies are now old enough to have their own history and tradition. Braddock's defeat points a moral. From it all arises an American consciousness. Customs and institutions that prevail in Europe no longer for that sole reason satisfy. The tide of individualism rising throughout Christendom finds in America a more plastic situation, and accordingly a readier acceptance. The schools reflect the general spirit of the times. In New England, compulsory maintenance of schools—originally imposed by the clerical oligarchy—finds greater difficulty of enforcement. Various devices avoid the increasing penalties. The single township school taught by the master gives way either to the "moving school" (*q.v.*) or to several neighborhood schools taught by dames (*q.v.*). This marks the approach of the district system (*q.v.*), aptly rated as "the low water mark of New England education." The reading and writing schools now become one to meet the general demand of the people and reach out toward the present first place of the elementary school in American education. The (Latin) grammar school, unsatisfactory for its narrowness alike of curriculum and patronage, begins to give way to the more democratic academy (*q.v.*). Franklin's academy scheme of 1743 gives best formulation to the most advanced opinion of the time, and is indeed still ahead even of American progressiveness. In higher education the same spirit of innovation is seen in the founding in 1754 of King's College, now Columbia University (*q.v.*), and the next year of the College of Philadelphia, now University of Pennsylvania (*q.v.*). Both manifested a sympathy for immediately practical studies hitherto unknown among colleges. Their advertised schemes were visionary in their comprehensiveness; and the actual practice differed little from the customary; but the change of attitude was unmistakable. There was evident intent to make conscious adapta-

tion to the present felt needs of everyday life and endeavor.

The close of the colonial period thus shows a real abandonment of the identical transplanting of European schools and curricula. The spirit of adaptation has set in. American education as a distinct type is already in the making.

**COLOR.** — A term popularly applied to any light sensation whatever. In science, however, it is limited to the chromatic qualities of light sensation, as distinct from the achromatic qualities, or gray. White light (achromatic) may, indeed, by being passed through a prism, be exhaustively analyzed into constituent color elements — red, orange, yellow, green, blue, indigo, violet (rainbow colors), and the intervening qualities. Although white light is as a sensation simple, it is as a physical phenomenon complex. Its constituent elements obtained in the way just mentioned are known as the pure, spectral, or monochromatic colors. Most of the colors, as we see them in nature or in objects of ordinary use, are not pure. They are usually obtained by the transmission of white light through a more or less transparent substance, such as "colored" glass, or by reflection from a surface. In these cases the object transmits or reflects only certain constituent rays of the white light which give some one predominant color tone rather than another; but few such objects yield spectrally pure colors. A given color may be defined, physically, by giving the frequency, the

amplitude, and the form of the ether vibrations producing it, and, psychologically, by stating its quality, hue (*q.v.*), or tone (*c.g.* red, yellow, blue), its brightness (*q.v.*) or intensity (*q.v.*), and its saturation (*q.v.*).

**COLOR AND HEARING.** — See CONÆSTHESIA.

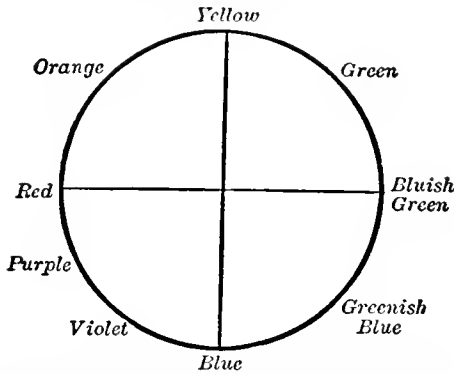

**COLOR BLINDNESS.** — A term applied to the inability to distinguish certain colors as such. It is usually congenital, and, if so, is incurable. It may, however, be caused by disease or accident affecting the visual apparatus. The rarest and most complete cases of color blindness involve the total absence of all color sensation. This is known as total color blindness, and is usually accompanied by painful sensitiveness to ordinary daylight. The objects which to normal beings appear colored would to such an individual doubtless appear gray. His visual world would, therefore, be one of different intensities of gray. The other types of color blindness are called partial color blindness, and of these the most frequent form is red-green color blindness. A person with red-green color blindness makes no distinction in color quality between all the spectral colors from red to green. In other words, by proper variation in the intensity of any two of these colors, such a person could obtain a perfect match. There are usually distinguished two types of such color blindness: the red type and the green type. The chief difference between them is that all reddish colors to the red type look darker than the greenish colors; whereas, for the green type, the greenish colors are darker and the reddish lighter. Certain cases have also been known of yellow-blue color blindness, but these are neither so frequent nor practically so important as the red-green types. The detection of any of the red-green types of color blindness is of huge importance, for on railroads or on boats the proper readings of red and green signals are essential for the safety of the passengers. (See Holmgren and Nagel's Test.) People who are ordinarily known as color weak are often found on investigation to have certain distinct types of anomalies in their color vision, although not of such an extent as to classify them with the red-green types. It is usually stated that about four per cent of all males are red-green color blind. Cases appear very rare among females, partly, undoubtedly, because it is not necessary, for practical purposes, to investigate their color vision as often as it is that of men. Defects in color vision may be inherited. Such inheritance

usually occurs through the female members of a given family, although they themselves may not be color blind. For instance, a color blind man having a son and a daughter would probably transmit his defect to his son, but not to his daughter. Her sons, however, would be likely to be color blind. R. P. A.

**COLOR CIRCLE.** — The important relations among the members of the chromatic (*q.v.*) series of qualities are conveniently shown in a circle. The series of pure spectral colors may, indeed, be represented by a straight line with red at one end and violet at the other (see **COLOR**); but the whole series of

Color Circle. The center of the circle represents white. All colors placed at opposite ends of diameters of the circle are complementary colors.

purples, not being monochromatic qualities, is then unprovided for. Since the purples are obtained, however, by mixing two colors near the respective ends of the spectrum (*e.g.* red and violet), it becomes quite proper to represent the entire series of chromatic qualities by a line returning into itself, *i.e.* a circle. Let the respective ends of any diameter represent red and its complementary (*q.v.*), bluish-green, and the ends of the diameter at right angles to this the colors blue and yellow, also complementary. It is then clear that all other qualities may be so disposed on the circumference that any pair of qualities lying at the respective extremities of a given diameter are complementary. The center of the circle would thus represent white, resulting from a mixture of the end colors of a diameter in appropriate proportions. If mixed in any other proportions, the result would resemble that quality of the pair which predominated in the mixture, but would be less saturated (see **SATURATION**). Any diameter, therefore, would represent two complementary saturated colors at

its extremities, white in the center, and, approaching the center from either color, an increasingly less saturated degree of that color. R. P. A.

**COLOR HEARING.** — See **CON. ESTHESIA**.

**COLOR INTENSITY.** — This term is often used interchangeably with brightness (*q.v.*). Properly, however, intensity refers to the physical correlate of light sensation. Light sensation is, in brief, produced by vibrations in the ether impinging on the retina. These vibrations possess a given wave length, which is the basis of the peculiar color quality of the sensation, — its tone or hue; a given form or complexity, conditioning the saturation (*q.v.*) of the sensation; and a given extent or amplitude of vibration. It is this amplitude that conditions brightness; the intensity, and therefore the brightness, increasing, the greater the amplitude, and decreasing, the less the amplitude.

 HOWELL, W. H. *American Textbook of Physiology* (Philadelphia, 3d ed. 1909.)

**COLOR-MIXING.** — As understood by the physiologist or the psychologist, this term is to be sharply distinguished from pigment-mixing (*q.v.*), which is employed by artists. Physiological color-mixing depends on the independent transmission of two or more different colored lights to the same area of the retina. It can be produced, for instance, by rotating, on the same axis, two or more disks of colored paper which are, by cutting each disk along one of its radii, so superimposed, one on the other, as to form a single disk, of which each color composes a sector. If this resultant disk be then rotated rapidly enough for all flicker to disappear, the various colors will fuse into a single color different from any of them. This means that the light, from the differently colored sectors have impinged upon the same area of the retina in such rapid succession that the physiological process set up by any one of them does not disappear before the processes set up by the others occur. The result might thus be called a mixture of physiological processes. When spectral or pure colors, which are obtained by analyzing white light into its elements (the colors of the rainbow, red, orange, etc.), are mixed, by means of appropriate apparatus, the color resulting from the mixture of any two colors from red, on the one hand, to and including green, on the other, is always some intermediate color, undiminished in saturation (*q.v.*). When any two colors from the same green to violet in the spectrum are mixed, the result is, similarly, some intervening color, diminished, however, in saturation. It is thus easily seen, by utilizing three given colors of the spectrum, namely, a certain

red, a certain green, and a certain violet, that one may obtain by appropriate mixtures any of the manifold spectral colors to which our eye is sensitive. When, however, any color between red and green is mixed successively with colors on the other side of green, the saturation of the resulting color diminishes very rapidly until a point is reached where all color disappears and the mixture becomes gray or white. Such pairs of colors are called "complementary colors," (*q.v.*) Beyond this point the mixture becomes purple, and it is among the purples that the complementary to pure green is found. See COLOR CIRCLE. R. P. A.

COLOR OF WALLS OF THE SCHOOL ROOM. — See ARCHITECTURE, SCHOOL.

COLOR SATURATION. — The degree of saturation of a color is the degree to which it approaches one of the neutral grays. The spectral colors are the most saturated, and the various tints (*q.v.*) and shades (*q.v.*) the least saturated that we know. In general, one decreases the saturation of any member of the chromatic (*q.v.*) series by mixing with it one of the achromatic (*q.v.*) series. Saturation and brightness (*q.v.*) or intensity (*q.v.*) are closely related, since a change in one is accompanied by change in the other — for example, increase in intensity brings decrease in saturation. Any color, however, of a given brightness, when mixed with a gray of the same brightness, would have its saturation decreased with no change in the brightness.

COLORADO COLLEGE, COLORADO SPRINGS, COL. — A coeducational, non-sectarian institution, the oldest college in the state, established in 1874 without denominational or state assistance, and under a Board of Trustees including representative professional and business men of Colorado. Before the organization of the college, a grant of land was made, in 1873, by the Colorado Springs Com-

pany, the founders of the city of Colorado Springs. Slow progress was made until 1888, when, upon the election to the presidency of William Frederick Slocum, the faculty was enlarged, the curriculum was revised and broadened, and Cutler Academy was incorporated as an associated preparatory school. Colorado College is one of the institutions originally accepted by the Carnegie Foundation for the Advancement of Teaching (*q.v.*) to participate in its system of retiring allowances to teachers. Besides the usual undergraduate courses in arts and science, admission to which is by examination or certificate from an accredited high school, the institution maintains a school of engineering opened in 1903 to meet the demand in the Rocky Mountain region for instruction in applied science. There are also schools of music and of forestry. In December, 1907, Colorado College completed an endowment fund of \$500,000. Gifts from private sources during 1907-1908 amounted to \$136,542; the annual income averages about \$55,000. The average salary of a professor is \$1666. There are (1909) 48 members on the instructing staff, of whom 13 are full professors. The students numbered (1910-11) 561, divided as follows: schools of liberal arts, science, and engineering, 520; school of music, 71. C. G.

COLORADO SCHOOL OF MINES, GOLDEN, COL. Established by act of the territorial legislature, Feb. 9, 1874. General control of the institution is vested in a Board of Trustees consisting of five members, each serving four years, appointed by the Governor of the state, with the advice and consent of the senate. The school supplies unusual facilities for the observation of practical mining work; within reach is a variety of smelting, mining, and milling work; in addition, numerous clay mines, coal mines, and quarries are located near Golden. The oil fields of Florence, the iron mines of Wyoming, and the copper regions of Arizona and Montana are also accessible. The departments of instruction include mining, metallurgy, geology, and mineralogy, civil, mechanical, and electrical engineering, physics, and chemistry. The only cultural work is a senior course in English composition given by the president. Admission to the school is by certificate or examination from accredited high schools. The college offers two four-year courses, leading to the degrees of Mining Engineer (E.M.) and of Metallurgical Engineer (E. Met.). Postgraduate courses for graduates of other colleges lead, after two years, to the same degree; there are additional postgraduate courses for advanced students specializing along particular lines of applied science. In 1906 grounds, buildings, and equipment were valued at \$416,341; the total annual income was about \$100,000. The average salary of a professor is \$2250. The instructing staff numbers 22. There are, 1910-11, 331 students. C. G.

**COLORADO STATE AGRICULTURAL COLLEGE, FORT COLLINS, COL.** — Established as a land-grant college and opened in 1879. Courses are given in agriculture, civil and irrigation engineering, electrical and mechanical engineering, domestic science, horticulture, forestry, veterinary science, and general science for women. In addition courses in music, oratory, and physical culture are maintained. Students are admitted either upon certificates from accredited high schools or by examination, for which the requirements are 15 units. Degrees are conferred on the completion of four-year courses. The college conducts farmers' institutes and short courses for farmers, and coöperates with teachers and superintendents of schools in the movement to introduce agricultural and domestic science into the public schools. There are 31 professors, and 40 instructors and assistants.

**COLORADO, STATE OF.** — Organized by Congress as a territory in 1861, from parts of Kansas, Nebraska, New Mexico, and Utah, and admitted to the Union in 1876 as the thirty-eighth state. It belongs to the Western Division of states, and has a land area of 103,645 square miles. For administrative purposes the state is divided into 59 counties, and these are divided, in turn, into school districts, cities, and towns. In 1910 Colorado had a population of 799,024, and a density of population of 7.7 per square mile.

**Educational History.** — Colorado was practically an unknown country previous to 1859. The first settlers were largely men, and a transient population as well; there were a few women and children. A private subscription school was opened in what is now the heart of Denver in October, 1859, with 13 children in attendance. The first schoolhouse was built in 1860 at Boulder, and the first public school was established there. By 1861 the population had increased to such an extent that Colorado was organized as a territory by Congress, and the first territorial legislature passed the first school law in September, 1861. This provided for the appointment of a Territorial Superintendent of Common Schools, at an annual salary of \$500, and for a school system modeled on that then existing in Illinois. Only a very imperfect form of organization was effected during the next ten years. School funds were often misappropriated, and the few schools in existence were largely neglected. In 1865 the office of Superintendent of Common Schools was abolished, and the Territorial Treasurer was made *ex officio* Superintendent. In 1870 the school law was revised and the outlines of the present system laid down. The office of Superintendent of Public Instruction was recreated, the appointment to be made by the Governor; school boards were given more definite authority in the control and management of the schools; provision was made for organiz-

ing new districts; and the school revenues were increased. In 1870 a state agricultural college (*q.v.*) and a state school of mines (*q.v.*) were nominally established, though the agricultural college did not open and the school of mines did not receive any permanent support until 1879. In 1871 the site was procured for the state university (*q.v.*), which had nominally been established ten years earlier; in 1874 the first appropriation for buildings was secured; and in 1877 the first appropriation for maintenance was secured and the institution was opened to students. In 1875 a State Teachers' Association was formed for the first time.

The constitution of 1876, adopted at the time of the admission of Colorado into the Union, made very definite provision for a state school system. The general supervision of the public schools of the state was given to an *ex officio* State Board of Education, with a Superintendent of Public Instruction, as its president; a county superintendent who was also to be *ex officio* Commissioner of School Lands, was provided for each county; a thorough and a uniform system of free schools was ordered for the state, and a three-month school for each district; the school fund was defined and declared inviolable; aid to sectarian schools, and the teaching of sectarian tenets, were forbidden; an *ex officio* Board of Land Commissioners was created to care for the public school lands; compulsory education for all able children was to be required "for a time equivalent to three years"; a Board of Regents for the state university and boards of education for school districts were provided for; and the prescription of textbooks for the public schools by the legislature, or by the State Board of Education, was forbidden. The school law of 1877 carried these constitutional mandates into effect. In 1889 the state normal school was established at Greeley, and it opened its doors to students in the following year. In 1890 a state course of study was prepared and adopted by the State Association of County Superintendents. In 1889 the first compulsory education law was adopted; in 1899 the law was revised and perfected; and in 1901 all school districts having more than 1000 census children were permitted to establish truancy districts. In 1903 the union high school law was passed. In the same year an effort was made to stop the unnecessary subdivision of school districts.

**Present School System.** — The school system of Colorado, as at present organized, is as follows. At the head is a State Superintendent of Public Instruction, a State Board of Education, a State Board of Examiners, and a State Board of Land Commissioners. The Superintendent of Public Instruction is elected by the people for a term of two years, and receives a salary of \$3000. He, or she

(a woman has been Superintendent continuously since 1894) is also *ex officio* State Librarian, president of the State Board of Education, and a member of the State Board of Examiners and the State Board of Land Commissioners. The Superintendent is charged with the duty of visiting the counties and of stimulating an interest in education in the state; of reporting to the Governor on the condition of the schools; of preparing all blanks and report forms needed; of rendering legal decisions on all appeal cases; of preparing all examination questions used at the quarterly examinations of teachers in the counties of the state; of apportioning the state school funds to the counties; and of acting as State Librarian.

The State Board of Education is composed of the Secretary of State and the Attorney-General, in addition to the State Superintendent, who is president of the board. The functions of this board are to grant state diplomas on the recommendation of the State Board of Examiners, and to revoke them for cause; and to hear and to decide appeals from the decisions of county superintendents. The State Board of Examiners conducts examinations for state certificates, and is a body made up in a curious manner, the law providing that it shall be "such as the Superintendent of Public Instruction, the President of the State University, the President of the State Agricultural College, the President of the State School of Mines, and the President of the State Normal School may appoint; *provided*, That the State Superintendent of Public Instruction shall be a member of said Board, and the presiding officer thereof." The State Board of Land Commissioners consists of the Governor, the Secretary of State, the Attorney-General, and the Superintendent of Public Instruction. To this board is given control of all lands belonging to the state, and they are directed "to manage the same as the best interests of the state shall require."

For each county there is a county superintendent of schools, but no county board of education. The superintendent is elected by the people for a two-year term. In salary he receives from \$1000 to \$2800, according to the size of his county. He is charged with the duty of supervising the schools of the county; of visiting each school once each quarter that it is in session; of inspecting the accounts of the school district officers; of keeping a full and complete record of his official acts; of appointing school directors in case of vacancies; of carefully examining and comparing the school census lists of the various school districts; of apportioning quarterly the county school money to the different school districts; of conducting the quarterly examinations for teachers' certificates, using for this purpose the questions prepared by the Superintendent

of Public Instruction; of holding such teachers' institutes as may be necessary or required; and of making an annual report to the Superintendent of Public Instruction.

Each county is divided into school districts. These are of three classes. Districts having over 1000 census children, 6-21 years of age, belong to the first class, and have boards of school directors of five members each, elected for five-year terms, one elected each year, and such boards elect their own officers. Districts having from 350 to 1000 inclusive belong to the second class, and districts having less than 350 census children belong to the third class. Second and third-class districts have a board of school directors of three, one elected each year for a three-year term, and the people vote directly for directors as president, secretary, and treasurer. Each board of directors has power to employ and discharge teachers and other employees; to suspend and expel pupils; to admit non-resident pupils and to fix the rates of tuition of such; to adopt textbooks, and, on the vote of the people, to provide them free to the pupils; to manage the school property, and to repair or build schoolhouses, as directed by the district; to determine the number of teachers, and the length of the school term; and is required to make an annual report to the county superintendent of schools. The secretary of the board, or some one appointed by him, must take an annual school census of all children between the ages of 6 and 21, and report the same to the county superintendent. An annual district meeting must be held to elect a director and to vote a district tax for maintenance and for lengthening the term. In case of failure to elect a director, the county superintendent appoints, and in case of failure to levy a tax for maintenance, the county commissioners must levy a tax on the property of the district. All cities are classed as school districts, and to their boards of directors are given the same powers and duties as are prescribed for districts of the third class, except that first-class districts may examine and certificate their own teachers, though such certificates are not valid for teaching elsewhere. (See special article on DENVER.) New districts, may be organized by petition and election, though, since 1903, no district can be subdivided that does not have an assessed valuation of at least \$20,000, a school census of at least forty, and, after division, each of the new districts must have a school census of at least twenty. Two or more districts may unite at any time to form one, by election and a majority vote.

*School Support.*—The state originally received 3,715,555 acres from the 16th and 36th section grants made by Congress for schools, besides two townships for a university, and 90,000 acres for an agricultural college. As Colorado was admitted later and at a time

when the states were not so hard pressed for money for education, the state has been able to profit by the unfortunate experience of many other states. The enabling act for the admission of Colorado to the Union established a minimum sale price of \$2.50 per acre, and this was raised, by law, to \$3.50 in 1887. But little of the land has been sold, despite a strongly advocated early policy of selling the lands as soon as possible. The policy has been to lease the land instead. Up to 1908 but 187,402 acres had been sold, while 3,374,169 acres remained, about one third of which was under lease. The total permanent school fund of Colorado consists of \$1,601,907 in invested cash. In addition, the state owes the common school fund \$1,225,975, for school money invested over twenty years ago, in interest-bearing state warrants, which the state has since repudiated and so far refused to pay, though the constitution makes it mandatory on the state to replace losses to the fund. The remaining lands are estimated to be worth, on an average, \$10 an acre. The interest on the invested cash, together with the rent of school lands, gives an income of about a quarter of a million dollars, and this is distributed to the counties on the basis of the number of children between the ages of 6 and 21.

Each county is required to levy a county school tax of not less than two nor more than five mills, but sufficient to maintain at least four months of school in each district, counting teachers' salaries at \$40 a month. The state school money is added to the county tax and to the income from fines payable to the school fund, and the entire sum is apportioned to the different school districts in the county on the basis of the number of children of school census age. Each district must levy a special district tax for the yearly maintenance of the school property and the miscellaneous expenses of the district, and may levy additional funds to provide better school facilities or a longer term. Directors in third-class districts are limited to 15 mills, but, by a vote of the electors of the district, this amount may be exceeded. Buildings must be provided by the district.

The total amount expended for schools during the last year for which reports are available was \$1,550,686. Based on the total population of the state, this was equal to a per capita expenditure of \$7.10 a year, as against \$1.27 for the U.S. as a whole, and \$7.49 for the Western Division. The average daily expenditure per pupil was 26.3 cents and the total yearly expenditure per pupil in average daily attendance was \$43.64, as against 19.8 cents a day and \$30.55 a year for the U.S. as a whole. Only eight states spend more for either item. In amount raised per child, 5-18 years of age (\$29.39), the state stands fifth. The total amount of money raised per adult male was

\$21.08, the state standing seventh in this item, and the amount being nearly twice the average for the U.S. (\$15.79). The wealth of the state is evident in that each adult male must contribute only 72 cents to provide \$1 for each child, 5-18 years of age, in the state, as against \$2 cents for the North Atlantic Division and \$1.02 for the U.S. as a whole. These figures, combined with those for attendance and term, show both the large relative wealth and the very large expenditures which the state makes for education.

*Educational Conditions.*—Of the population of 1900, 83.1 per cent were native born; 98 per cent were white; by sex, 54.7 per cent were males; and 22.5 per cent were children between the ages of 5 and 18 years. The state is mountainous, and is essentially a mining state. Large areas are practically uninhabited. Of the total population, 30 per cent live in cities of over 25,000 inhabitants, and 51.7 per cent live in rural districts. Of the school population, 5-18 years of age, in 1907-1908, 101.25 per cent were reported as enrolled in the public schools, as against 88.19 per cent in 1899-1900, 72.20 per cent in 1889-1890, 60.82 per cent, in 1879-1880, and 42.28 per cent, in 1870-1871. The average for the U.S. as a whole was 69.32 per cent. Of the number enrolled, 65.06 per cent were in average daily attendance, which equaled an average daily attendance of 109.5 days per year for each child in the state, 5-18 years of age, and 109.5 for each child enrolled. The average length of term provided in Colorado was 166.2 days, as against 154.1 days for the United States as a whole, and 163.3 days for the Western Division.

Colorado has a reasonably good compulsory education law, which from the statistics of attendance would seem to be well enforced. All children under 14, and under 16 if they cannot read and write, must go to school at least half of each day, if not employed, unless excused from attendance for cause. All boards of school directors, in districts having 350 census children or over, are required to appoint truant officers to enforce the law; all cities having a total population of 100,000 or over (Denver) must provide a truant school; and cities of 25,000 or over may do so. If a child of school age must work to support itself or to support a dependent person, or if the parents are too poor to provide the necessary shoes, clothing, or books, it is then the duty of the poor relief authorities to extend such relief as will enable the child to attend school. No child under 14 can be employed to labor in any business whatever during school hours, unless the child has attended school at least 12 weeks in each year, 8 weeks of which must have been consecutive, and he must possess a certificate to that effect signed by the teacher. School directors are charged with the duty of enforcing the law. Colorado stands well

toward the top of the column in literacy, the state having but 4.2 per cent of illiterates in the total population 10 years of age or over, while the lowest percentage found in any state was 2.3 per cent. Almost all of the Colorado illiteracy is found among the foreign born, most of whom are miners.

In material conditions the schools have made remarkable progress within recent years, and most of them are now relatively well equipped. Despite the fact that 40 per cent of the teachers of the state are teaching in rural school districts, and that about 15 per cent of the school buildings still in use are built of sod, adobe, or logs, the average value of all of the school buildings of the state was \$5216 at the last report, and the expense for new buildings is increasing rapidly. Of all school money raised, 19.4 per cent was expended for sites and buildings in 1907-1908 and 11.6 per cent in 1908-1909.

The board of directors of any school district are permitted to levy a special school library tax, not to exceed one tenth of a mill, the proceeds of which are to be used in building up a school district library. Any board of school directors may establish a kindergarten, and pay the expenses of the same by a special tax. Six cities provide work in manual training, in three cases extending the work through the high school. Some work in manual training is also offered in a few of the smaller towns.

*Teachers and Training.*—The state employed 5291 teachers in 1907-1908, of which 85.3 per cent were women. Of the total number, about 64 per cent were employed as teachers in graded (town and city) schools, at an average monthly salary of \$92.95 for men and \$65.35 for women, and for an average yearly term of 176.2 days. The average monthly salary for teachers in rural schools was \$56.80 for men and \$51.57 for women, and for an average yearly term of 136.3 days. Three grades of certificates are issued on examinations, held quarterly by the county superintendents, on questions prepared by the Superintendent of Public Instruction. The examination embraces all of the common school studies, theory and practice of teaching, and the school law of Colorado. Teachers of previous teaching experience who pass with a high average are granted a first-grade certificate, valid for three years, renewable, and with intercounty recognition. Others who pass with high grade receive a second-grade certificate, valid only in the county where issued, and for 18 months. A third-grade certificate, valid for 9 months, is also issued. Those who expect to teach in high schools must also pass an examination in the high school subjects which they propose to teach, and this virtually constitutes a fourth grade of teachers' certificate. Graduates of the normal school of Colorado alone are exempt from the examinations.

State certificates valid anywhere in the

state are granted by the State Board of Education, on the recommendation of the State Board of Examiners, to: (1) Those who have established their eminent professional ability by teaching at least two years in the state, who hold a first-grade certificate, and who pass an additional state examination; (2) without examination, to those who have taught six years and have rendered eminent professional services to the schools of the state. Life diplomas and state certificates from other states are not recognized. No statistics are available to show what percentage of the teachers of the state held these different grades of certificates. To train teachers for the schools, the state maintains the Colorado State Normal School at Greeley, which is a large and a well-equipped institution. What percentage of the teachers of Colorado have had normal training cannot be told, but something is indicated by the fact that during the first fifteen years of its existence the state normal school graduated only 965 students, though in 1908 it graduated 180. One private normal school, with 77 students, is listed for the state. As a means of training teachers in service, the state makes provision for the maintenance of a normal institute for at least two weeks in each of the 13 institute districts into which the state is divided. The state controls these normal institutes, but makes the teachers and the counties pay for them. The State Superintendent, the president of the state normal school, and a committee of county superintendents of each district determine the time and the place of the institute, and select the conductor for the institute. All conductors, members of the state normal school faculty excepted, must hold certificates of qualification issued by the State Board of Examiners. A state institute course of study has been adopted, in syllabus form, to be followed by the conductors.

*Secondary Education.*—By 1908, the last year for which complete statistics are available, there were 77 district (town and city) high schools in Colorado, 13 county high schools, and 9 union district high schools. Eleven of the district high schools were in cities of 8000 or more inhabitants, and one, the Manual Training High School of Denver, is a large technical high school. These 99 public high schools report a teaching force of 427, and 10,321 students enrolled. Private high schools are a very minor factor in Colorado, only 5 being reported, with 22 instructors (all women) and 184 students. Any district having more than 350 census children may form a high school whenever the board of school directors may deem it expedient. Any two or more contiguous districts may unite to form a union high school. In counties not smaller than the fifth class (there are seven classes), a county high school may be formed by a majority vote of the taxpayers of the county, called by a peti-

tion of 50 electors to the superintendent of the county. A county tax of a sum not to exceed 2 mills may be levied for the support of a county high school. In union high schools the union district shares in the state apportionment of school fund, just as an elementary school district, and the balance needed is provided by the uniting districts in proportion to the number of pupils attending the high school from each district. No provision exists by which a high school, once formed, can be discontinued. The high school legislation of Colorado, while better than that of many other states, still leaves something to be desired in the matter of support. Separate funds are not provided, the method of supporting district high schools is unsatisfactory, and the whole method opens the way, as is the case in many other states, for the development of fine high schools at the expense of the elementary schools beneath.

*Higher and Technical Education.*—The state maintains the University of Colorado (*q.v.*) opened in 1877 at Boulder, for the collegiate instruction of men and women; the state agricultural school (*q.v.*) at Fort Collins, opened in 1879 for instruction in agriculture, science, and mechanic arts; and the state school of mines (*q.v.*) at Golden, opened in 1874, for instruction in metallurgy, mining, and engineering. The higher instruction provided by the state is supplemented by the following private institutions:—

Colorado College ( <i>q.v.</i> )	Colorado Springs	Non-sect.	1874	Both sexes
College of the Sacred Heart ( <i>q.v.</i> )	Denver	R. C.	1888	Men

The University of Denver also offers professional instruction in law and dentistry.

The state also maintains the State Industrial School for Boys, at Golden; the State Industrial School for Girls, at Morrison; and the Colorado School for the Deaf and Blind, at Colorado Springs. The first two are reformatory institutions.

**COLORADO, UNIVERSITY OF, BOULDER, COL.**—A state university under the control of a Board of Regents elected by popular vote. The university was incorporated

by an act of the territorial legislature in 1861. After receiving sums of money and land from the legislature, Congress, and private sources, provision was made in the state constitution to adopt the university as a state institution in 1876. The university thus became entitled to the land grants from Congress. The new state institution was then opened in 1877 with preparatory and college departments; a medical school followed in 1883; in 1892 a law school was opened and graduate courses were offered; the college of engineering was established in 1893; in 1904 the summer school was instituted; in 1906 the college of commerce and in 1908 the college of education were organized. The preparatory department was closed in 1907. The plant now includes 17 buildings used for purposes of instruction and as dormitories. Well-equipped laboratories and several valuable collections are maintained. Students are admitted to the college of arts, commerce, and education on fulfilling requirements equivalent to 15 units of high school work. Admission is by examination or certificate of an accredited high school. For entrance to the school of law two years of work in the college of liberal arts will be required after 1911. The requirements for the school of engineering include more units of mathematics and less of languages than the college of arts. The admission requirements for the medical school are those laid down by the Association of American Medical Colleges with the addition of two years of work in the college of liberal arts. In the session 1909-1910 there were enrolled 1221 students, distributed as follows: graduate school, 83; college of liberal arts, 577; college of engineering, 292; school of medicine, 80; school of law, 102; summer school, 113. The faculty includes 87 professors and 7 assistant professors, 73 lecturers, instructors and assistants. James H. Baker, M.A., LL.D., is the president.

**COLUMBA, ST., ABBOT OF IONA.**—

Born in Donegal County, Ireland, 521, and educated in the monastic school of Moville and afterwards in the monastery of Clonard. Columba was active in the foundation of the monasteries of Derry, Durrow, and Kells; but in 563 he turned his missionary energies toward Scotland, and became the apostle of its conversion. He was presented with the isle of Iona, where soon arose by the labor of his hands and those of his twelve comrades the beginnings of the greatest of the early Scottish monasteries. From Iona Columba made journeys throughout Scotland, erecting monasteries wherever he met with a favorable reception. Near these monasteries churches were built, and the Abbot of Iona, though no more than a simple presbyter, consecrated bishops with the advice of a *collegium seniorum* of his convent. With the monasteries came to Scotland the monastic schools and learning which at that time were nowhere better represented than among

the Irish Celts. St. Columba died at Iona in 597. P. R. C.

**COLUMBAN, or ST. COLUMBANUS.**—An Irish monk, one of the most sincere and powerful preachers and writers of his day, was born in Leinster about 543; died in a cavern near his monastery at Bobbio, near Pavia, in 615. Columban received his education first on one of the islands of Lough Erne and afterwards at the monastery of Bangor. It is clear that he represented the highest culture of his age, since he possessed a knowledge of Juvenal and other ancient poets and of the early Fathers. About the year 585 Columban went to Gaul, and, finding his way to Burgundy, succeeded in founding monasteries at Anegray, Luxiul, and Fontaines. He drew up a monastic rule, which may be found in Migne, *Patrol. Latina*, Vol. LXXX. This rule, like the Benedictine, enjoins the copying of manuscripts as a monastic duty, and even prescribes the task of teaching in schools. Drawn into a controversy with the French monks, Columban was banished from Burgundy on charges of attacks upon the King and the Queen Mother, and of keeping Easter at the unorthodox season that was favored by ancient Irish custom. Columban thereupon departed to Nantes, thence to the Rhine and Zürich, thence to Zug and Lake Constance. After two years of preaching to the heathen in this vicinity, Columban turned his face toward Italy, and was well received in Lombardy, where he founded his monastery of Poggio about 613, some two years before his death.

**COLUMBIA COLLEGE, COLUMBIA, S. C.**—Chartered in 1851 for the higher education of women, and opened in 1859. It is under the auspices of the Methodist Episcopal Church, South. Preparatory, collegiate, musical, and commercial departments are maintained. The college courses which lead to bachelor's degrees in arts and science are based on about 14 points of high school work. There is a faculty of 21 instructors.

**COLUMBIA JUNIOR COLLEGE, MILTON, ORE.**—A coeducational institution founded in 1899 and maintaining preparatory,

academic, collegiate, commercial, and fine arts departments. The college course is based on about 8 points of high school work.

**COLUMBIA UNIVERSITY, CITY OF NEW YORK.**—An institution which in point of student enrollment is the largest educational institution in the United States, had its beginnings when, in 1754, a fund of £3500 having been raised by public lottery, George II of England granted a royal charter for King's College, and in the following year a building was erected upon land given by Trinity Church. The first president and the sole instructor of the eight students who enrolled was the Rev. Dr. Samuel Johnson, a man distinguished among the colonists of the eighteenth century for scholarship and philosophical insight. After his resignation in 1763 came Myles Cooper, who was an ardent royalist and who promptly returned to England at the outbreak of the Revolution. The college exercises were suspended, leaving Alexander Hamilton and other patriotic students free to take up arms. In 1784 the institution was reopened, and in 1787 was rechristened Columbia College. The new president was William Samuel Johnson, one of the framers of the Constitution and United States Senator from Connecticut. Johnson, who was the son of the original head of King's College, was probably the first lay college president among English-speaking peoples.

Until the middle of the nineteenth century the college grew very slowly. Many of the professors were men of distinction, including Samuel Mitchill, also United States Senator, Robert Adrain, the mathematician, and Charles Anthon, the classicist. The alumni of this period, also, continued to play an important part in the development of the city and the state, including as they did such men as DeWitt Clinton, Hamilton Fish, and Abram S. Hewitt. The financial resources of the institution, however, were inadequate, and the student attendance never rose much above a hundred. In 1849, however, Charles King was appointed president, and the development began which changed a denominational college, making only a local appeal and having but 125 students and 7 or 8 professors to a national institution having to-day more than 7000 students and more than 600 instructors. During King's presidency the college moved from its original home in Church Street to East 49th Street. A law school was established in 1858, and a school of mines and metallurgy in 1864. In 1860 came a nominal union with the College of Physicians and Surgeons, which in 1817 had absorbed the original medical department, founded under Cooper in 1765. His administration was distinguished also for the presentation, in 1857, of a trustees' report outlining the establishment of courses of research and other university developments,

Architectural Model of Columbia University.

The Low Library.  
COLUMBIA UNIVERSITY.

which, though conceived in advance of its time, marks an important step in the history of higher education in the United States.

President Frederick A. P. Barnard's administration, 1864 to 1889, was one of continuous growth. The income from the two main endowments of the college, the Trinity Church land and the Botanical Garden on Fifth Avenue (given by the state legislature in 1814) had increased with the growth of the city, and the institution was now upon a financial basis which made development possible. A school of political science was established in 1880, a department of architecture in 1881, and during this decade additional technological courses were established. Barnard was a leader in the movement to provide for the higher education of women. To his influence is due the independent establishment in 1889 of Barnard College (*q.v.*). He was also one of the first to appreciate the dignity of teaching as a profession and the necessity for adequate preparation therefor. He gladly lent his aid to the modest beginnings of Teachers College (*q.v.*), which was founded in 1888, and was destined to become one of the most vital parts of the university that was to grow out of Columbia College.

President Barnard died in 1889, his successor being Seth Low, of the class of 1870, former Mayor of Brooklyn and after his resignation as president, Mayor of the city of New York. During Mr. Low's administration, 1890-1901, the several schools, which had up to that time been but loosely connected, were welded into an organic whole. In 1890 the school of philosophy was established for graduate work in philosophy and letters. In 1891 the College of Physicians and Surgeons, which had previously had an independent charter, was merged in the university. In 1892 the graduate school of pure science was organized. In 1896 the title Columbia University was adopted, and in the following year the institution moved to its present site on Morningside Heights. In 1900 a summer session and a department of extension teaching were established.

During the administration of President Nicholas Murray Butler, '82, who at the time of his election in 1901 was dean and professor of philosophy and education, the university has grown rapidly in numbers and influence. Additional land has been purchased, many new buildings have been erected, and the financial resources largely increased. In 1904 the New York College of Pharmacy, while retaining its corporate existence, became the school of pharmacy of the university. In 1906 a faculty of fine arts was formed. Other incidents of this administration have been the reestablishment of dormitory life for the men—the institution having had no dormitory since the eighteenth century. A close alliance has been formed with the New York School of Philanthropy, with the Prussian Ministry

of Education for an annual exchange of professors, with Yale University for a joint course in preparation for public service. The ties with the nearby theological seminaries established during Mr. Low's administration have been made closer, particularly in the case of the Union Theological Seminary, the new buildings of which are contiguous to the university. Provision has been made by Mr. Joseph Pulitzer for the establishment, in the future, of a university school of journalism, and plans are being matured for the organization of courses in forest engineering, agriculture, landscape gardening, and preventive medicine. Teachers College has grown remarkably, and is doing pioneer work of the greatest importance in household and industrial arts. (See HOUSEHOLD ARTS.)

Columbia University is still operated under the original charter of King's College, last amended in 1811. A self-perpetuating board of 24 trustees, one fourth of whom, however, are now nominated by the alumni under the Dartmouth plan, hold the title to all property, appoint all officers, and have ultimate control over the affairs of the university. The work of the trustees—and it is a real working board—is mainly done in small standing committees, on education, finance, buildings and grounds, etc. Except for the care of the finances, which is in the hands of the treasurer, the president has charge of the general administration. Columbia is rather conspicuous for the number of officers assisting the president, whose work is wholly or mainly administrative, and for the responsibility entrusted to them. The theory of the trustees is that routine administrative work done by teachers is done at the expense of their scholarly work, and provision being made in the faculties and council for the formulation of educational policies, the carrying out of these policies is falling more and more into the hands of these administrative officers, who include the twelve deans and directors, who are in immediate charge of their several schools, the librarian, the chaplain, consulting engineer, secretary, registrar, alumni secretary, bursar, and superintendent of buildings and grounds.

There is the customary subdivision of officers of instruction into faculties on the basis of programs of study, and into departments and divisions on the basis of subjects or groups. The highest academic body is the University Council, consisting of the president, the deans (who are appointed by the trustees), and two elected members from each faculty. The council was organized under President Low, largely for the purpose of standardizing graduate work, but with time it has taken on larger functions, and important matters of university policy are now customarily referred to it before action is taken by the trustees.

The educational policy of the university may be broadly summarized as follows. En-

trance to the collegiate courses, Columbia College for men and Barnard College for women, is so administered as to permit the entrance of any worthy student who can show, by examination, the preparation of a good secondary school course or its equivalent. Once admitted, the quality of the work of a college student, quite as much as its quantity, is considered in advancing him for graduation, and under the operations of the present rules, many students graduate in three or three and a half years. As has not been infrequent in rapidly growing institutions, the question of efficiency in teaching had not until recently been receiving its due prominence in the administration of these colleges, but at present this question is undergoing careful scrutiny on the part of the university.

Entrance to the professional schools — law, medicine, mines, engineering and chemistry, architecture, education, pharmacy — should be based upon more than a secondary school training, but should not be unduly delayed by demanding a four-year college course as a prerequisite. Columbia was the pioneer in making provision for combining collegiate and professional courses, and has developed this plan until at present the capable student can complete the requirements, both for the bachelor's degree and any professional degree, in six years. Excepting the college of pharmacy, the schools of applied science are the only ones which do not now require for entrance at least two years of college work, and here the preliminary college work is strongly recommended and is being taken by an increasing number of students. The courses of higher instruction and research are open only to those who have had college training, including special preparation for advanced work in the major subjects. These students are given the greatest possible freedom in the choice of subjects and in the prosecution of their work. The summer session and the extension courses, beside giving an opportunity to those who cannot take university work at other times, are valuable elements of articulation between the university and other institutions, and through them students are frequently enabled to complete their university requirements without an undue loss of time.

In all its work, it is the policy of the university to take every possible advantage of its metropolitan situation and to enlist the coöperation not only of the libraries, museums, hospitals, and other public institutions, but of the personal service of the experts in every branch of knowledge, its own alumni and others, who naturally congregate in a great city. The student of architecture, for example, has the benefit of criticism by leaders of the profession of his own choosing, and the engineering student similarly meets men whose advice is of the greatest value to him. Provision is made whereby senior medical students have con-

tinuous service as clinical clerks in the hospitals of the city.

The university library numbers about 430,000 volumes, and the scientific equipment for instruction and research is in general very good, the laboratory equipment being constantly replenished from the income of a large fund bequeathed for the purpose by the late Stephen Whitney Phoenix, '59.

The physical appearance of the university is impressive. It stands on the summit of a rocky hill in the northern part of Manhattan Island, surrounded by a notable group of public buildings, including the Cathedral of St. John the Divine, St. Luke's Hospital, the Union Theological Seminary, the Institute of Musical Art, and Grant's tomb. (The schools of medicine and pharmacy are at present at 59th Street and 68th Street respectively.) The grounds at Morningside, including those of Barnard College and Teachers College, cover 32 acres. There are in all 41 university buildings having a total floor area of 1,677,691 square feet, erected at a cost of about \$11,500,000. The buildings of the University Corporation are being erected in accordance with a unified architectural scheme of great dignity, for which credit is mainly due to the late Charles F. McKim. The central library, the gift of President Low as a memorial to his father, is a classical building of white limestone, and the surrounding buildings are of brick with limestone trimmings. The university has land enough for a normal growth during the next ten or fifteen years, but the city is rapidly closing about it, and as the present value of vacant land in the vicinity is more than \$1,000,000 per city block, the difficulties surrounding its future growth cannot be overestimated. The preliminary legal steps have been taken for an interesting project to provide a university stadium by filling in the Hudson River shore at a point a few hundred feet distant from the university.

The teaching staff, which now numbers more than six hundred, has its share of the most distinguished American instructors and investigators. It is being constantly recruited by men for whom the stimulus of metropolitan life is a more powerful factor than its undoubted expense. Perhaps the university is most notably strong at present in the political and social sciences, and in the fields of education, English, philosophy, and technology. As is likely to be in the case of an urban university, the intellectual pace is swift, and the 1150 titles in the annual university bibliography contain more than the average number of contributions of permanent value to scholarship.

The students registered in 1910-1911 are divided as follows: Columbia College, 729; Barnard College, 521; nonprofessional graduate schools, 991; law, 365; medicine, 316;

mines, engineering, and chemistry, 713; fine arts, 179; pharmacy, 283; Teachers College, 1402, and summer session, 2632, a total, excluding duplicates, of 7452. In addition there are many registered extension students. More than half the students in the university are graduates of higher institutions of learning, representing in each year more than 250 American institutions of collegiate standing and 75 or more similar foreign institutions. Of the total registration, about one third are women.

The makeup of the student body is extraordinarily complex. In the college there have always been a number of the Knickerbocker and other old established New York families. Side by side with these are an increasing number of country boys who go to the city for their education for the same reason that many city boys go to the country. The professional and graduate students come from all parts of the world. Situated, as Columbia is, at the main gateway of the country, it is not surprising that a large number of the students are of foreign birth or parentage. The Germans of the second and third generation are here in large numbers, and the number of Italian and Scandinavian students of the same class is rapidly growing. In addition there are each year some 150 students coming direct from foreign countries. Twenty years ago Columbia was known as the "Rich Man's College." It is now coming to be appreciated as the "Poor Man's University." The opportunities in New York for students who have to support themselves are wide, and the earnings of the 500 men who report to the employment committee aggregate each year more than \$150,000. In spite of the doleful predictions which were made when, in 1905, intercollegiate football was summarily abolished as an "academic nuisance," the various student activities are in a prosperous condition. Twenty-four Greek letter fraternities have chapters at Columbia. Among the innumerable other organizations, perhaps the most interesting are the clubs, semi-scholarly and semi-social, composed of instructors and students who are bound together by common interest to some subject of study. Student journalism, debating, and dramatics flourish, and the university has a creditable position in various branches of sport, notably rowing, basketball, and association football.

The annual budget of the university, including the four constituent corporations, is now over \$2,500,000. Of this sum, half comes from student fees, about one fourth from the rents of real estate, one eighth from the income of trust funds, and the remainder from special gifts. Of the income about \$1,500,000 is devoted to teachers' salaries and the remainder to the purchasing of books and apparatus, to the general administration, and to a sinking fund for the liquidation of the debt of

\$3,000,000 incurred in developing the site at Morningside.

Within the past eight years, the university has received in gifts the sum of \$12,500,000, and the noble bequests of John S. Kennedy, one of the trustees, which will amount to nearly \$2,200,000, and George F. Croeker's bequest of over \$1,600,000 for medical research, are about to become available. The net value of the university property, taking the figures of the city tax department, for the buildings and grounds, is \$36,317,000, divided as follows: Columbia College, \$30,159,000; Barnard College, \$3,090,000; College of Pharmacy, \$133,000; Teachers College, \$2,935,000.

**COLUMBUS, CITY OF.**—The capital and the fourth city in size in the state of Ohio, and the seat of the state university of Ohio. In 1910 the total population was 181,511. Its school census, 6-21 years of age, was 39,674 in 1909; and its total day school enrollment was 22,077, and its total night school enrollment was 290. The enrollment in private and parochial schools was 4496 additional. Of the total population in 1900, 10 per cent were foreign born and 6 per cent of the colored race. The foreign born were chiefly Germans and Irish.

The first school was opened in Columbus in 1805, and the first schoolhouse was built in 1806. By 1826 Columbus contained four English schools and a classical academy. A high school was opened in 1832. The city was incorporated in 1834; and in 1845 a special law was passed by the legislature organizing a board of education of six for the city, and granting to them certain powers. In 1847, a Superintendent of Schools was elected, the first in Ohio; the schools were graded into primary, secondary, and high schools; and the school library was begun.

The schools now operate under the general laws of the state of Ohio governing cities. The Board of Education consists of three members elected at large, and twelve from sub-districts. Election is for four years, one half going out of office every two years. The board elects a Superintendent of Schools, who nominates all teachers for election by the board. A City Board of Examiners of three, of which the City Superintendent is clerk, examines and certifies all teachers for the schools. A city normal school, with a course

of a year and a half beyond the high school, trains teachers for the elementary schools. A truant officer looks after the enforcement of the compulsory attendance laws. Supervisors of music, art, and physical training are employed. Manual training is not taught in either the grades or the high school, though some instruction in domestic science is offered. German is an optional study from the third grade through the high school. Four high schools, with somewhat similar courses, are maintained. The public school library, under the control of the Board of Education, contains about 70,000 volumes.

The school system consists of a normal school, 4 high schools, and 37 day elementary schools. 591 teachers (4 in evening schools) and 5 supervisory officers were employed in 1908-1909, 91 of these teachers being employed in the high schools. The total cost for current expenses and maintenance in 1908-1909 was \$713,518, 86 per cent of which was raised by local taxation.

**COMBE, GEORGE** (1788-1858). — Phrenologist, born at Edinburgh. He was admitted to the practice of law in 1810. His career was, however, changed after 1815, when

George Combe (1788-1858).

he became interested in the work of Spurzheim (*q.v.*), to whose movement he was converted. He became the leader of the phrenological study in Great Britain, and devoted the rest of his life to it, writing and lecturing on the subject and its applications. In 1819 he published *Essays on Phrenology*; in 1821 the *Elements of Phrenology*; and in 1828 appeared his most important

work, *Essay on the Constitution of Man*, which ran through several editions and had great popularity. The movement had been attacked by Sir W. Hamilton (*q.v.*), and defended by Combe. The years 1838-1840 he spent in America on a lecturing tour. While there he interested Horace Mann (*q.v.*) in his work. On his return he wrote *Notes on United States*. In addition to his main study he turned his attention to education and became a strong advocate of secular schools on a national basis. In 1833 he published *Lectures on Popular Education*. Although the study for which Combe stood was early discredited by scientists, it was due to him that a strong popular interest was taken in it for many years after his death.

**COMBINATION TONE.** — A resultant tone which arises from the sounding of two loud tones together. Synonyms, "resultant tone," "third tone." Combination tones embrace difference tones and summation tones. The pitch of the first difference tone corresponds to the difference in the vibration frequency of the two generating tones. The pitch of the summation tone corresponds to the sum of the vibration frequencies of the two generating tones. Thus, in sounding the two tones A', 435, vibrations, and C'', 522 vibrations, together, the first difference tone will be 87 vibrations (522-435), and the summation tone will be 957 vibrations (435+522). Under favorable circumstances, second, third, and even fourth difference tones corresponding to successive differences between the lowest tones present, may be heard. Combination tones play an important rôle in the enrichment of musical clangs. They are most effective when the generating tones are consonant and within the same octave. Like overtones, they ordinarily pass unrecognized in music. Two or more tones of the same pitch become one when sounded together. Thus, three organ tones of the same pitch sounded in different parts of the room will be heard distinctly as one tone which assumes a location in a specific place outside of the sounding instruments. This is called fusion sound or phantom sound, and is, in a way, related to combination tones. C. E. S.

**COMBINED METHOD.** — A general term applied to a mixed system of teaching which incorporates the main feature of two or more distinguishable methods. The system of teaching arithmetic partly by "topics" and partly by the "concentric circle" plan is a typical case of a "combined" or "combination" method.

See ECLECTIC METHOD.

**COMENIUS, JOHN AMOS (KOMENSKY)** (1592-1670).—The pioneer of modern educational science. Although his fame depends almost entirely on his work for education, Comenius would have been the last to admit that he lived for the school alone. Inspired by what he considered to be a higher mission, he was compelled throughout the greater part of his life in spite of his chief interests to devote himself to the work on which his reputation rests. Comenius was born in 1592 at Nivnitz in Moravia, and was brought up by guardians (his parents having died early) in the faith of the Moravian or Bohemian Church. From these he acquired the religious zeal and

piety and earnest devotion to a cause which marked his career. He received an elementary education in the local schools, and showed no intellectual aptitude or scholarship until his sixteenth year. He was then sent to the gymnasium at Prerau. It was thus not until 1608 that he began the study of Latin, a circumstance which was fortunate, for he was old enough to appreciate the inefficiency of the prevailing methods. He saw that what was charged to the idleness of the pupils was really due to the inability of the teachers to present a lesson properly. The schools he later characterized as "slaughter-houses of the mind, . . . where ten or more years are spent in learning what might be acquired in one . . . places where minds are fed on words." In 1612 he matriculated at the University of Herborn in Nassau, where he came into contact with the encyclopedist, Alsted (*q.v.*), who was himself interested in education. About the same period the fame of Ratke (*q.v.*), who had been endorsed by the two universities of Jena and Giessen, was at its height and naturally attracted the attention of Comenius. The two years, 1612-1614, he spent

at Amsterdam and Heidelberg. Returning to his native country at the age of 22, and finding himself too young to be ordained for the ministry, he accepted the position of Rector at the gymnasium at Prerau, near Olmütz. And now began the activity and reforms which were to occupy him to the end of his life. For this school he wrote an elementary Latin grammar (*Grammaticae facillioris praecepta*, 1616). At the age of 24 he was ordained, and in 1618 he was appointed pastor over Fulneck, with the additional duties of school superintendent. He was married about this time, and spent two happy years at his work. But the Thirty Years' War had broken out, and in 1621 the Spanish soldiers swept over the region where he lived and destroyed everything. He was forced to flee, and lived for a time on the estate of Karl von Zerotin, reading works on education and familiarizing himself at any rate with the more important writers. In 1622 he lost his wife and children. Five years later the Moravian pastors were proscribed, and found protection with Baron Sadowsky von Slaupna. Here Comenius wrote *Rules of Method* for John Stadius, tutor in the baron's family. He also began in Bohemia a didactic work under the influence of the *Didactic* of Elias Bodinus. In 1628 the greater part of the Moravian community was compelled to take refuge in Poland at Lissa. Among them were Comenius and his wife (he had married for the second time in 1624). Here Comenius became Rector of the Gymnasium of the Moravian Brethren. His work was now inspired by a twofold aim—to reform the schools and to educate the children of his faith for the restoration to their homes according to the current prophecies which were believed by Comenius. But he had no intention of revolutionizing method. He was willing to learn, and read much and entered into correspondence with many prominent educators. Among these was Ratke, who twice refused to vouchsafe a reply. Comenius found what he was seeking among his contemporaries; for example, he found that C. Vogel, principal of the *Pedagogium* at Göttingen, had introduced a graduated scheme of Latin lessons consisting of words arranged alphabetically, with the German meanings attached, to be combined into sentences. J. C. Frey, in a work on education published in 1629, had advocated the colloquial method of language-teaching and the importance of real studies. Comenius was aiming at a method of teaching which should be universal and time-saving; children were to learn with ease, and the time which was thus saved was to be devoted to studies which were of equal importance—morality and religion. For already Comenius conceived that the end of education was broader than the acquisition of knowledge, and must look to the divine. A better education would heal the dissensions of Church and State. In 1632 he completed the *Magna Didactica*, or *Great*

*Didactic* in Czech; this work was not published until 1849 at Prague, after it had been recovered from the archives at Lissa. At the same time Comenius had also devoted himself to the preparation of class books, which were to contribute to the larger aim expressed in the *Great Didactic*. He felt the need of a textbook including a vocabulary of essential Latin words and giving the structure of sentences as an introduction to the reading of the classical authors. A book of this type had been suggested in 1627 by Bodinus, and Comenius devoted the next few years to compiling it. It was while he was already engaged on the book that a similar work of Bataeus, an Irish Jesuit settled at Salamanca, was brought to his notice. The *Janua Linguarum* of Bataeus had first appeared in Latin-Spanish in 1615, was speedily produced in other languages, and in 1629 an edition in eight languages was issued. Comenius saw many defects in this: the selection of words was poor; the words, though used only once, were not given in their prime significance; the sentences did not have a moral content. In 1631 he published his own work, already completed in 1628, under the title of *Janua Linguarum Reserata, sive Seminarium Linguarum et Scientiarum Omnium* (*The Gate of Tongues Unlocked, or a Seminary of the Tongues and all Sciences*). This was his most famous book, and alone would have made him a notable character in his own century. Within a short time it was translated into Latin, Greek, Bohemian, Polish, German, Swedish, Belgian, English, French, Spanish, Italian, and Hungarian of the European languages, and into Arabic, Turkish, Russian, and Mongolian of the Asiatic. For many generations the schoolboys of three continents thumbed this book as their primer to the languages instead of the Donatus and Alexander of preceding generations. And very different from these it was, though in some respects not much less difficult. The plan of the book was simple and "natural." Starting with several thousand of the most common Latin words referring to familiar objects, the plan was to arrange them into sentences, beginning with the simplest and becoming progressively more complex, and in such a manner that a series of related subjects would be presented, the whole presenting a brief encyclopedic survey of knowledge as well as affording a vocabulary and a working knowledge of simple Latin. This text will give a fair conception of the pansophic ideal as well as the new tendency in the subject matter of education. The 100 different chapter headings included such subjects as these, introduced in the order given: Origin of the World, the Elements, the Firmament, Fire, Meteors, Water, Earth, Stones, Metals, Trees and Fruit, Herbs and Shrubs, Animals (in several chapters); Man, his body, external members, internal members, qualities of the body; Diseases, Ulcers, and Wounds; External Senses; Internal

Senses; Mind, the Will, the Affections; the Mechanic Arts (in several chapters); the Home and its parts: Marriage; the Family; State and Civic Economy (in several chapters); Grammar, Rhetoric, Dialectic, and the various branches of knowledge; Ethics; Games; Death, Burial, Providence of God; the Angels. Care was taken that every grammatical structure should be presented so that a complete grammatical knowledge would be developed inductively by the skillful teacher. Each page gave in parallel columns the Latin sentence and the vernacular equivalent, and the instruction dealt with material that, in its elementary form at least, was within the experience of the child. The chief defect of the book, one arising from a violation of a principle emphasized by Comenius, was the failure to repeat the words, the object being to use each word only once. Besides necessitating a vast amount of repetition and arousing the dislike of the pupil, it had the disadvantage of giving only one meaning to the word (though that was always the root signification), and only one construction. While the idea had been suggested by Ratke, and ineffectually executed independently by Bataeus, this was the first successful attempt at the construction of textbooks according to modern and psychological principles. And after the improvements made by Comenius himself, little further advance was made for a century and a half. The *Janua* was the work of three years' labor of the author, but in reality it was the product of the centuries since the opening of the Renaissance.

In the same year in which he completed the *Janua Linguarum* he wrote the *Informatory of the Mother School* and the *Schola Infantiae*, books which indicate that his interest in education was not confined to the Latin schools. The idea of the mother school he had embodied in the *Great Didactic*.

His educational activity was interrupted by a request from the Brethren which resulted in the writing of the *History of the Bohemian Brethren* and *History of the Persecutions of the Bohemian Church*, and several doctrinal works. In 1633 he resumed his earlier work, publishing in that year a *Physics* which gave a synopsis of the physical universe. Although he had come into contact with Bacon's works, this work is ample proof that he little comprehended the inductive or experimental method in science. Theologian as he was by profession, Comenius could not get away from the methods of theology, and his *Physics* shows him employing the methods of analogy and the authority of the Scriptures, which he used where the medieval scholastic philosopher would have referred to Aristotle. For some of the fantastic ideas contained in this work he was indebted to Campanella. The world, he maintained, is constituted from the three principles of water, spirit, light; while the "qualities" of all things are consistency (salt), obosity (sulphur), and aquosity (mercury). But while theology was responsible for these

survivals of the medieval, Comenius distinctly stands for the study of natural phenomena and the dependence upon sense perceptions as the source of knowledge concerning nature. As an easy introduction to the *Janua Linguarum* Comenius wrote in 1633 the *Vestibulum*, or *Entrance Hall*, in which the form of the larger work was retained. The book contained 1000 words combined in 427 simple sentences, and an introduction giving instructions for the use of the work.

From this period dates Comenius' scheme for a pansophic work, a universal encyclopedia, an authoritative statement of all that had been done within the realm of science. This work was to be called *Janua Rerum sive Sapientiae Porta*. The project attracted the attention of Samuel Hartlib (*q.v.*) and some English admirers who were familiar with the *Janua Linguarum*. On Hartlib's request Comenius wrote *Pansophici Libri Delinatio* (*Outline of my Work on Universal Wisdom*), which Hartlib without his knowledge or consent published under the title of *Comatuum Comenianorum Praebudia* (*Prelude to the Efforts of Comenius*, Oxford, 1637), and which was called by Comenius *Prodromus Pansophiae* (*Precursor of Universal Wisdom*). The pansophic idea had been stimulated by Bacon's *Advancement of Learning*, which opened up visions of unparalleled progress. From universalism in knowledge it passed on to universalism in human affairs and gave rise to hopes which Comenius strongly held of a unification of the Christian world. For the present Comenius advocated not only the encyclopedia of natural phenomena, but also a *Collegium Didacticum* or *Pansophicum* which, like "Solomon's House," suggested by Bacon in the *New Atlantis*, was to form a central laboratory and clearing house for all manner of scientific research. Comenius was invited to England to lay his views before Parliament in 1641, but on his arrival found it protracted. When Parliament met again, everything seemed favorable to the proposed institution. Several buildings in London and Winchester were suggested, and at last Chelsea College was practically decided upon, when the Civil War broke out and diverted all interest. But Comenius did not surrender the hope of reorganizing human knowledge, which with a universal language was to form the basis of a reorganization of society. While this ideal aroused enthusiasm, Comenius was hardly the man to lead in such a work, for he was ignorant of the first principles of research. But this enthusiasm afforded a stimulus to his other work by which he was destined to be remembered, while his ideal was soon forgotten. Although in his *Physics* Comenius had shown himself incapable of appreciating the Baconian method, he displays the extent to which he had advanced beyond some of his contemporaries in the aphorisms included in the *Pansophici Libri Delinatio*, which may be summarized as

follows: God, nature, and art are the objects of universal knowledge which to be perfect must be full, true, and ordered. All things originated in accordance with ideas which come ultimately from God; hence the world is an image of God and everything is interconnected. The basis of all things is harmony. Hence Comenius deduces the possibility of knowing all things through apprehending fundamental conceptions and norms by means of induction from natural phenomena, the easiest and most accessible for the purpose of making experiments. (See the Aphorisms in full in Monroe, *History of Education*.)

While in England, he wrote *Via Luceis* (published 1668), supplementing his pansophic plans and suggesting the need of universal schools, language, books, and college. Since the English support could no longer be relied upon, Comenius now decided to accept an invitation to Sweden sent to him by an admirer, Ludovic de Geer, in the hope that there a better opportunity would offer itself of realizing his pansophic ideal, and, if possible, of restoring his people to Moravia. He was soon, however, to be disillusioned, for his interviews with Oxenstiern and Skythe soon convinced him that his services were sought to write school textbooks and not to regenerate the world.

The next few years present a pathetic picture of Comenius struggling to subdue the overmastering desire to do something for his ideal, of angry letters from his patron De Geer, even of charges of dishonesty. But he labored patiently, and in 1646 had completed a series of books which were submitted to a committee of three in Sweden. These books included the *Methodus Linguarum Novissima*, which was a longer work than the *Great Didactic*, and dealt only with the teaching of languages — Latin being taken as a type — and contained a description of the author's own textbooks; the *Januae Linguarum novissima clavis*, *Grammatica Latino-Vernaculo*, a grammar for the *Janua*; the *Lexicon Januale* in Latin; the *Vestibulum*, *Janua*, and *Atrium*, which were revised and published later.

In 1647 he was selected Bishop of the Brethren, and for the next few years he devoted himself to his clerical duties in addition to his other work. He had several invitations to reorganize school systems, and in 1650 he established a school at Saros Patak, near Tokay, which, in addition to giving Comenius a free hand at putting his ideas into practice, was to be equipped with a printing press. For the organization of this school he published the *Sketch of the Pansophic School*. While at Saros Patak he remodeled the *Vestibulum* and added a list of words in the vernacular and Latin, for Comenius had now decided that words should come before sentences. The *Janua* was also rewritten and included a lexicon of words, a grammar and text in this order, certainly not an improvement on his first edition, which, however, he repudiated. He now began to justify his method by the analogy of building — first the word, then the tools

for shaping it, and last the structure. The third textbook was the *Abrium Linguae Latinae* to which a complete Latin grammar is prefixed. The text is an enlargement of that of the *Janua*, and prepared for the *Palatium* or *Thesaurus* of works selected from the classical Latin writers. In this period falls the *Orbis Pictus*, or the *World in Pictures*, which was to enjoy greater popularity than any other of Comenius' writings and was to create a new departure in school textbooks. The full title was *The World of Sensible Things drawn; that is, the Nomenclature of all Fundamental Things in the World and Actions in Life reduced to Ocular Demonstration, so that it may be a Lamp to the Vestibulum and Janua of Languages.*" This was probably the first successful application of pictures to school uses. The use of pictures naturally arose from Comenius' advocacy of things before words; when the things could be used, so much the better;

Comenius was greatly enjoyed by the pupils who took part and by the parents who witnessed the performances. Two other interesting works formed part of the scheme of organization — the *Precepts of Manners* (*Præcepta Morum*) and *Laws of a well-ordered School* (*Leyes Scholæ bene Ordinatæ*), — the one dealing with rules of behavior to be expected from boys, the other with principles of school and classroom administration.

In 1654 Comenius took leave of the school at Saros Patak and returned to Lissa, where he again plunged into his pansophic work, buoyed up still more by renewed prophecies of the speedy restoration of the Moravians. His superstitions led him into indiscretions, and when the war between Poland and Sweden broke out, the Moravian community was scattered by the Polish army and Comenius' library was destroyed by fire, including what he regarded as his most precious possession, a *Silva*, or collection of materials on which he had worked for twenty years for his complete Pansophic treatise. Fortunately Comenius found a home at Amsterdam under the protection of Laurence de Geer, a son of his former patron. Here he began a revision of his works for a new edition, wrote an addition to the *Vestibulum* under the title of *Auctarium*, a collection of sentences made up of root words and intended to bridge the gap between the *Vestibulum* and the *Janua*. While at Amsterdam, he was attacked for his Latinity — probably the most vulnerable point in his works — and defended himself in the *Pro Latinitate Januæ Comenianæ Apologia*. To guard against further attack he wrote a severely critical account of his method in the *Ventilabrum Sapientiæ sive sapienter sua retractandi Ars* (*The Fanner of Wisdom, or the Art of wisely retracting one's own Opinions*). In 1657 he published a collected edition of his works in four parts under the following title: *J. A. Comenii Opera Didactica Omnia, Variis hucusque occasionibus scripta, diversisque locis edita; nunc autem non tantum in unum, ut simul sunt, collecta, sed et ultimo conatu in Systema unum mechanicè constructum, reducta. Amsterdami Impensis D. Laurentii de Geer. Excuderunt Christophorus Curvulus et Gabriel a Roy. Anno 1657.*

With the publication of his collected works Comenius retired from what he regarded as the disgusting task of writing school books (*Latinitatis studia mihi toties nauseata*), and was encouraged by De Geer to continue his pansophic labors. At the same time he devoted more and more attention to the prophecies and chiliastic hopes, writing a collection of prophecies which he had heard, under the title of *Lux in Tenebris*, followed in 1663 by an up-to-date edition called *Lux e Tenebris*. These works brought him into theological controversies in which he was frequently worsted and finally held up to ridicule and contempt.

A page of the alphabet from the *Orbis Pictus*.

otherwise, pictures could take their place. *Nihil in intellectu quod non prius fuit in sensu.* In the preface to this work he says: "For it is certain that there is nothing in the understanding, which has not been previously in the sense; consequently to exercise the senses carefully in discriminating the differences of natural objects is to lay the foundation of all wisdom, all eloquence, and all good and prudent action." He had already recommended that the classroom walls should be covered with pictures. The cuts were executed by Michael Endter of Nuremberg. Each object in the pictures was accompanied by a number, and the name was given in the text in Latin and the vernacular. Another experiment of this period, all inspired by the same purpose to objectify the lessons, was a dramatized version of the *Janua*, the *Schola Ludus*, which according to

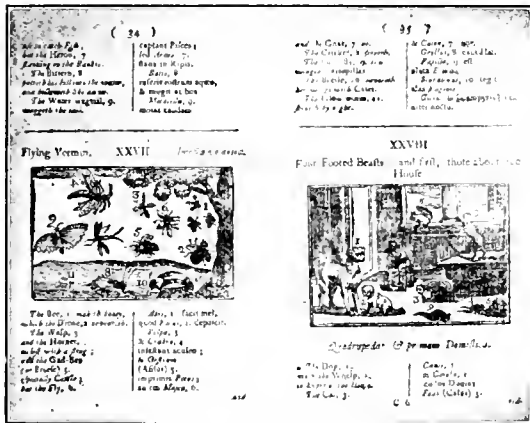

Lack of funds prevented much progress on the pansophic work, but in 1666 he completed a *Janua Rerum* which was published in 1681, a metaphysical treatise which embodied the notions of his youth and shows no trace of the influence of inductive reasoning. The last few years of his life were embittered by attacks on his faith in prophecies, which went beyond academic controversy and were directed against his personal character. Comenius died on Nov. 15, 1670, and was buried at Naarden, near Amsterdam.

It remains to give some account of the work which has secured for Comenius a lasting place in the history of education, which in parts was so far ahead of its time as to appear prophetic. This work is certainly one of the most remarkable educational treatises ever composed. Though essays or books on didactics were among the most numerous of the publications of those times, the *Great Didactic* is a remarkable variant from the ordinary type. Both its ideas, or principles, and its arrangement are strikingly modern. On the contrary, the form in which the ideas are expressed, as well as the particular interpretations of the method used,

the men, and in fact "the more we occupy their thoughts, the less will there be place for the rashness which springs from empty minds." The end of education is social that man may acquire a knowledge of the good, and thus "every one will know how to prepare himself for all the actions and desires of life, within what bounds he shall advance and how his present situation shall be secured." Men need education "that they may be men." Hence the State must undertake to provide schools of different types to afford education up to the age of 24. In the primary stages up to 12, education must be universal and compulsory. Four types of schools are required: The *School of Infancy*, or the Mother School, for the first six years of childhood; instruction here is to be given in the family by the mother in external things, employing also the aid of pictures. Here the beginnings are to be made with those subjects which will be developed more fully on the concentric method in later years: metaphysics, *i.e.* familiarity with general terms and causal relations, physics, *i.e.* knowledge of natural objects around him, optics, astronomy, geography chronology, history, arithmetic, geometry statics, mechanics, dialectic, grammar, rhetoric, economics, polity, morality, religion, and piety. By these high-sounding terms Comenius meant little more than that the child should be given opportunities of expressing himself and of learning something about his environment. But from the foundation thus laid each subject would be expanded in future years on the concentric method.

After the mother school comes the Vernacular School for pupils from 6 to 12. Such a school ought to be established in every little village and association of human beings. The general aim of this school is to develop the inner senses, imagination, and memory, and to train the intelligent citizen. Here the opportunity is given to all human beings to be instructed in all those things that have to do with human affairs. Hence a common minimum is established. With the vernacular school closes the education of those who are intended for the workshop. Boys of ability are to be encouraged to proceed further to the Latin School or Gymnasium for pupils from 12 to 18. Such schools should be established in every city. It is interesting to notice that Comenius had insisted on a system of scholarships as a condition of his undertaking the work at Saros Patak. It is highly probable that he had this in mind in the *Great Didactic* when he suggested that no intelligent scholar should be refused admission to the Latin School merely on account of poverty. The higher school is to train the intellect and judgment. The six years of the course are crowded to the full by the great range of subjects, including the seven liberal arts as well as physics, geography, chronology, history, ethics, and theology. It is a striking

A page from an early English edition of the *Orbis Pictus*.

are thoroughly colored by the theological character of the age and by the professional training of the author. So sane and far-seeing are the precepts of this work that it may even yet be read with greater immediate profit to the teacher, sufficiently intelligent to avoid many minor errors, than the majority of contemporary educational writings. Some of the main principles of the *Didactic* were embodied in the textbooks, and a solid foundation is laid for the educational development of the succeeding centuries.

The purpose of education is to foster man's inborn tendencies to social life, to acquire knowledge, and to look to God. All human beings are equally entitled to an education without distinction of rank, sex, or ability. The duller pupils require more help than the bright. As for women, they are as capable as

feature that Comenius, reformer though he was, could not bring himself to revolutionize the curriculum; hence the new was added to the old, with the result that the burden was increased and there arose a danger that the pupils would merely get a smattering of the numerous branches of the proposed curriculum. At the end of six years an examination was to be held and only the best students were to be permitted to proceed to the national academy or university, the institution for the training of professional men and scholars. Here, too, the course was to last six years. The students were to be inspected by outside commissioners, and degrees were to be awarded only to the worthy. The crowning institution of all was to be the *Collegium Didacticum*, the College of Light, framed in accordance with the author's pansophic ideals.

Throughout Comenius never forgets the care of bodily health and recreation. The school day should be one of four hours, so that pupils should have time for recreation and domestic work, if necessary. The morning hours of the school program were to be devoted to those subjects which exercise the memory and understanding, and are accordingly more fatiguing; the afternoon was to be given to subjects which employ the voice and hand. The schools were to be divided into one class for each year, each class having its own textbooks. Care was to be devoted to the school and classrooms to make them attractive. The discipline was not to be as harsh as was usual in those days; severe punishment should be inflicted only for moral offenses. "When a musician's instrument emits a discordant note, he does not strike it with his fist, or with a club, nor does he bang it against the wall; but continues to apply his skill to it, till he brings it to tune." How modern many of the ideas, contained in this great work of the sixteenth century are, need not be pointed out. Compulsory education, a recognized curriculum appealing to every side of human interest, organized schools and classes, an educational system with an educational ladder, the opening up of opportunities to intellect, milder discipline, physical exercise, moral training, — all these are found in the *Great Didactic*, ideas which have in part been realized but recently, in part still continue to be advocated.

Psychologically, however, Comenius was not ahead of his time, though he was familiar with the best that was thought on the subject. That he was a sensationalist goes without saying; to empiricism he added a faculty psychology, with the faculties arranged in a kind of hierarchy, so that one could not be trained before the other. "It is lost labor to try to form the will before the understanding, or the understanding before the imagination, or the imagination before the senses." But whatever his psychology, Comenius was the first

who made any attempt to apply that science to teaching; his method was psychological rather than logical. But to this he also added the method of analogy, and so he turned to nature, from which he drew twenty-nine principles of method to help children to learn "quickly, pleasantly, thoroughly." From these natural principles he extracted principles of method which have not been improved upon in modern times, although they may have been established on a better foundation. In Chapter XIX, 20, there is a foreshadowing of the apperception and interest theories. Since his method was the natural method, Comenius held that it was the universal method; hence the teacher could prepare himself by properly learning this. With this method and uniform textbooks one teacher could instruct a class of any size. "The sun is not occupied with individual objects, tree or animal, but lights and heats the whole earth." Here too he did not move ahead of his contemporaries. The aim of the age was to discover universal principles as a means of unbounded progress. Comenius developed his universal principle in education, and he cannot be blamed for falling into the enthusiasm of the time. What success he would have achieved, had he understood the significance of Bacon's formulation of the scientific method, it is difficult to say. The remarkable fact is that he attained so much on *a priori* reasoning, for the principles which he developed in his *Great Didactic* he tried to apply consistently to his textbooks which achieved so much success.

Whether considered from the point of view of theoretical writings or from that of direct treatment of schoolroom problems, Comenius is one of the most important representatives of the realistic movement as well as one of the leading characters in the history of education. Indeed, the most scholarly of his recent biographies expresses the judgment that Comenius is "the broadest-minded, the most far-seeing, the most comprehensive, and withal the most practical of all the writers who have put pen to paper on the subject of education; the man whose theories have been put into practice in every school that is conducted on rational principles, who embodies the materialistic tendencies of our 'modern side' instructors, while avoiding the narrowness of their reforming zeal." However, this panegyric contains an exaggeration, in that, while the writings of Comenius deserve all of this encomium, his actual influence on his own and following generations was slight save in one respect, — that of a more scientific method of teaching the languages as embodied in his textbooks. For almost two centuries even the very knowledge of these most important educational writings ceased to exist; consequently, they had little or no direct influence upon later educational reformers. It is true that Comenius' ideas "have been put into practice in every schoolroom conducted on rationalistic prin-

ciples," but altogether aside from any influence exercised by Comenius; for a knowledge of Comenius and his writings was not possessed by those who practiced his principles. The greatness of Comenius consists more in his early formulation of those principles in concrete terms, than in his direct influence in the introduction of such principles into subsequent educational practice. After his own generation, it was not until near the middle of the nineteenth century that these remarkable educational writings of Comenius were again called to public attention by the early German historians of education, and consequently that due recognition has been given to the place of Comenius in educational reform. His ideas of education were similar to those of Ratke, to whom, however, on account of the secrecy and charlatanism of his method, Comenius owed little or nothing, save the suggestion of a "natural" method. But these ideas, common to both, were worked out into a far more extensive scheme and in much greater detail by Comenius. They were more consistent, more logically presented, and far more modern than were those of the earlier innovator.

**COMES, NATALIS, or COMITIBUS, NATALIS DE.**—An Italian writer who published in 1551 his *Mythologiae, sive Explicationis Fabularum, libri decem*. In a Geneva edition of 1620 this work, together with the same author's *De Venatione*, takes up 1125 octavo pages, not counting an extensive index, all in Latin. The work is a comprehensive dictionary of mythology, Greek and Latin, and contains a full account of writers on mythology, confining itself to pre-Renaissance writers. He quotes from over 600 authors, and, as he gives copious quotations, the work presents the appearance of a vast anthology. The schoolboy or student was thus introduced to accounts of the ancient gods, goddesses, and mythical personages in the very words of ancient writers (Greek and Latin). This intimacy in the use of the old classics was an excellent training in translation, and afforded abundance of material for themes and verses. Moreover, it was a vast object lesson in the art of making of common-

place books (a favorite method of instruction in the old grammar schools, throwing activity of search on the boys themselves), which could be applied in other subjects besides mythology. There is also to be found the treatment of mythology as symbolism. It is altogether a remarkable production, showing the immense patience, labor, and resources of the old Post-Renaissance scholars, which penetrated gradually into the classrooms of the old grammar schools. Charles Hoole, in the *New Discovery of the Old Art of Teaching School* (1660), recommends Natalis Comes for use in the fourth form of the English grammar school, as supplying pupils with fit epithets, phrases, apophthegms for themes and verses, etc., and names Natalis Comes along with the following for this purpose: Sandys' translation of Ovid, Alexander Ross's *English Mythologist*; Francis Bacon's *De Sapientia Veterum, Verderius' Imagines Decorum*, and the like. These are to be kept in the school library for reference, "to invite them like so many bees to busy themselves sucking up matter and words to quick their invention and expression." F. W.

**COMMENCEMENT.**—**Historical Development.**—A term used in American universities and educational institutions in general for the exercises connected with the conferring of degrees. It was borrowed from the similar use at Cambridge, when it was equivalent to the medieval term, "inception" (*q.v.*). The first commencement exercises were held at Harvard University in 1642 on the second Tuesday of August. On this occasion the degree of Bachelor of Arts was conferred on nine candidates. The ceremony was in the early days attended by the governor, judges, and other executive officials, by ministers and other men of note. A procession was formed, consisting of the corporation, overseers, guests, and students, and moved from Harvard Hall to the old Congregational church at Cambridge, where the exercises were held. The president opened with a short prayer; a member of the graduating class gave a salutatory oration in Latin; then there "were Latin and Greek orations and declamations, and Hebrew analysis, grammatical, logical, and rhetorical, of the psalms; and their answers and disputations in logical, ethical, physical, and metaphysical questions; and so [the candidates] were found worthy of the first degree (commonly called bachelor) *pro more Academicarum in Anglia*." The degree was conferred with the permission of the overseers by the president, who placed a "book of arts" in the candidate's hand and pronounced a Latin formula. A dinner was then given in Harvard Hall, and in the afternoon the procession returned to the church where the degrees were conferred on the masters. Commencement Day was always accompanied

by great festivities and rejoicing, which in the seventeenth century developed into excesses, just as the inception at the University of Paris had done earlier. Sumptuary laws were passed in 1722 prohibiting commences from "preparing or providing either plumb cake or roasted or baked meats, or pies of any kind" and from having in their chambers "distilled liquors or any composition made therewith." But no amount of supervision could check the disorder until late in the century. Attempts were made to hold private commencements without announcing the day or date until actually necessary, but protests were made not only by those who were concerned as candidates or guests, but also by the people of Boston, who regarded and kept Commencement Day as a general holiday. The private ceremonies only were held during the Revolutionary period.

The commencement exercises at Yale College were very similar. Its first commencement was held at Saybrook on Sept. 16, 1702, when the degree of Master of Arts was conferred on four Harvard men and one candidate received the degree of Bachelor of Arts. The first ceremony at New Haven was held in September of 1717, when the degree of Bachelor of Arts was conferred on five students. The first public commencement was held in September, 1718, when the Governor and several executive officers were present. The same form of ceremony was employed as at Harvard. President Clap gives the following account of its celebration during the middle of the last century. "The public Commencement is ordinarily on the second Wednesday in September annually: at which there is a large assembly, consisting of the President and Fellows, a great number of Ministers, and other learned and superior gentlemen. The President begins the solemnity with prayer, one of the candidates for the first degree makes a salutatory oration to the Governor and Council, the Officers of College, and the whole assembly: the others give a specimen of their learning, by disputing syllogistically on the questions printed in their theses: which are then distributed. The like is done in the afternoon by the candidates for the degree of Master of Arts. Then the President, with the consent of the Fellows, gives them their degrees, three at a time, in this form: *Pro auctoritate mihi commissa, admitto vos ad Primum Gradum in artibus: pro more Academicarum in Anglia. Vobisque trado hunc Librum, una cum potestate publice praelegendi, quotiescunque ad isthoc munus evocati fueritis: cujus haec instrumenta, membrana scripta, testimonio sint.* The like form is used for the Masters, only instead of Primum, it is Secundum: and instead of praelegendi, it is profitendi: and sometimes, instead of Primum, the President says, Gradum Baccalaureatus; and instead of Secundum, he says Gradum Magistralem. Then one of

the Masters makes a Valedictory Oration: and the President concludes the whole solemnity with a prayer."

**Present Condition.**—In the present commencement are represented several academic principles or practices. (1) Administrative action. The most important meeting of the Board of Trustees is held at this time. Election of professors is made and academic policies are adopted. (2) Conferring of degrees. These degrees are both ordinary, representing scholastic merit, and honorary. These degrees are conferred in public, and the granting is usually accompanied with much *éclat*. (3) The baccalaureate. This term has come to stand for the sermon on religious or ethical address which is given to candidates for degrees the first Sunday of Commencement week. Although usually given by the president or college pastor, it is not infrequently given by a specially invited clergyman. The theme chosen is commonly broadly religious, allowing personal application of its truths to the candidates for degrees. (4) Commemorative. In the commemoration are involved at least three parts. (a.) The history of the academic year which is closing. This history is usually presented in writing by the president, and sometimes orally. (b.) Graduates and former students return to pay respects to their *alma mater*. Classes in particular return for their triennial, decennial, and for their twenty-fifth and fiftieth anniversaries. (c.) *De mortibus*. Each college has a necrologist who presents either in print, or orally, or both, a record of graduates who have died in the preceding year. (5) Academic speeches. These speeches are of one of two sorts—made either by graduates of the year or by an orator called from outside academic walls. The speaking by graduates, although less common than formerly, is continued by many colleges. In this process there is a certain degree of reason. The delivery of an oration indicates how well or how ill the orator thinks, and to think is a comprehensive purpose of the college training. The delivery of an oration may speak much for the character of the orator, and to form a noble character is a comprehensive purpose of a college training. But the public orator, called for the occasion, represents a more usual present method of academic speech. He represents a broad field of utterance. Any one of the many relations of the college—scholastic, administrative, professional—he regards as a proper theme for discussion. Public questions—political, literary, sociological—are also frequently presented. Commencement oratory is, with the exception of political and clerical, the most important in America. (6) Social festivities. A graduating class, as a class or through divisions, or by individual members, sets forth many social privileges. Dances, dinners, "spreads," dramatic entertainments, concerts, are the more usual forms. "Class Day" is the special

term applied to the opportunities thus given. At Harvard, for instance, Class Day has great historic social significance. (7) A holiday. For the whole college or university, and for the neighborhood in which it is situated, especially if that neighborhood be rural, commencement is a holiday season.

In most colleges commencement occurs once a year and in the month of June. But certain institutions, notably the University of Chicago, hold commencement four times each year. Although in a narrow sense commencement represents a single day, in a broader sense it covers in many colleges an entire week.

**COMMERCIAL EDUCATION. — General Survey.** — Commercial education is now generally understood to include all education which prepares specifically for business careers. It is no longer limited to the narrowly technical or practical training which fits the student to perform the various operations that are necessary in the exchange of commodities, but it is generally taken to exclude the training that prepares for the work of production. With the practical training there is usually associated a certain amount of the liberal, or cultural, element of education. The proportion of this element differs widely in the almost innumerable forms of commercial education found in the United States and in foreign countries. In some it is practically nil; in others, it comprises over nine tenths of the whole amount of time given to study.

Recognition of this branch of education has been somewhat tardy, and can hardly be said to be complete even now. One reason for this is obviously the fact that a century ago the transaction of business was a simple matter compared with the complexity of our present organization. Commercial life itself was not very highly developed, and was, indeed, considered too humble a form of activity for the exercise of great talents, or for any special preparation. All this has been changed now. Commerce has so extended its sphere, and has so developed its organism that it has become the field for the greatest intellects. Thorough preparation for it has become recognized as necessary, though there are still great divergences of opinion as to the form this preparation should take. Until recently it was not thought to be a function of either public or private schools — a function of education, in the sense the word was used. For that matter, the very combination of words "commercial education" is somewhat anom-

alous. Opposition to the conjunction came from both elements. The ideals of education and of business were regarded as directly opposed. The earnestness with which educators opposed the introduction of the commercial aim, or commercialism, into their methods is only paralleled by the cordiality with which the majority of business men condemned the aims and methods of education as impractical and useless for their purposes. Within the past quarter century utterances by each party to the detriment of the other have been frequent, but they are nearly silent now. Recognition of commercial education has come, and the two warring elements have been partially reconciled. That they have been brought to realize the essential unity of their interests and their mutual helpfulness is not the least important advance made by education in the past quarter century. For, although the recognition of commercial education has been tardy, and although it is still in an experimental stage, its growth has been rapid enough to leave no doubt of its usefulness. If the figures were not in themselves sufficient proof of the fact that commercial education has grown in response to a real need and a real demand, it would be only necessary to examine its early history both in this country and abroad.

**History in the United States.** — The beginning of commercial education in the United States was characteristically American. It was a growth, not an institution — a growth of private enterprise in response to public need. It was spontaneous, and several early forms were almost simultaneous. All were in answer to definitely voiced demands. In the early part of the last century there was practically nothing in the way of instruction to prepare for business life. Boys who looked forward to business careers left school early and entered stores or offices, where they served apprenticeships of greater or less duration. Here they learned such bookkeeping and business methods as were then in vogue. The quality of instruction they obtained depended, of course, on the employer. There was small opportunity for comparison or improvement of methods, and progress was slow, individually and collectively. Even this meager instruction was not to be obtained by all. The increasing importance of commerce attracted more men than the offices and stores could train; and this training, moreover, was too slow for those who had already reached manhood. Mr. R. M. Bartlett, one of the pioneers in commercial education, has related his unsuccessful efforts to obtain instruction in bookkeeping. His experiences were probably like those of many other young men. Their demand was unheeded by the public and private schools then in existence. As it increased, private schools and classes in bookkeeping sprang up in all the principal cities of

the country, somewhere between 1830 and 1840. These private schools, formless and unsystematic as they were, gave the first commercial education and were the forerunners of the modern business schools, now numbering over 2000, that are found in every important city in the United States and that have over one half the total number of students receiving commercial education of any kind.

To whom belongs the honor of the first venture in commercial education is a matter of some dispute. It has frequently been attributed to the above-mentioned R. M. Bartlett of Philadelphia, who established a school there in 1843 to provide the substitute for apprenticeship, of which he had himself felt the need. By others the honor is claimed for James Bennett, a New York accountant, who seems to have conducted a private school, in which bookkeeping and navigation were the principal subjects, some time between 1818 and 1836. The exact date when the school was begun is not known. James Gordon Bennett, with whom James Bennett is frequently confused, announced a school of this kind in 1824, but it is doubtful if it was ever established. Other early schools were founded by Peter Duff of Pittsburg, George N. Comer of Boston, and Jonathan Jones of St. Louis. Most of these early schools had bookkeeping as their foundation subject. There were some, however, of slightly different origin. They were begun by itinerant penmen, such as Silas S. Packard and Platt R. Spencer, who formed penmanship classes in various cities. From these classes schools often sprang up. The number of these business schools seems to have increased with more rapidity than their quality. Penmanship and bookkeeping were still the main subjects, with frequently the addition of commercial arithmetic and commercial law. Later stenography and typewriting came in. But in general the instruction given was purely technical and along narrow lines. Practical utility rather than cultural value was sought. The instructors were frequently men of deficient education, especially in English composition, and in many cases encouraged extremely mechanical methods of work.

What was more serious, the aims of education were often defeated by too great an influence of the money-making spirit in the management of the schools. Energetic and resourceful men established chains of business schools in a number of cities throughout the country. These they placed in charge of young men as managers, who were to share in the profits. The most important of these chains was that established by H. B. Bryant and H. D. Stratton, whose efforts began in 1853 and resulted by 1863 in a strong combination of schools, to the number of fifty or more, all under their general management. So suc-

cessful were they that about 1866 they made an attempt to monopolize the field of commercial education by crushing all competition of other business schools. Internal dissensions and opposition by the managers of many of their branches, and the failing health of Mr. Stratton, the real director of the organization, made this plan impossible of execution. Other associations of commercial schools were begun in 1866, but none rose to the commanding position enjoyed by the Bryant and Stratton chain in the early 60's. The intense competition which followed was productive of as great evils as the monopolistic system. Special inducements were offered to part-time students. In some cases the only requirement for entrance was the necessary fee. Vast sums of money were spent in all kinds of advertising. Brass bands, stump speeches, and penmanship exhibitions at county fairs and the like were among the schemes resorted to by some of the aggressive "educators." It is not surprising, in view of this, that there were many charlatans in the field, and that the work suffered accordingly. In spite of the evils, the schools grew in number and in size with astonishing rapidity. They furnished training that was not to be obtained elsewhere, and served an extremely useful and necessary purpose. From an enrollment of at most a few score students in 1840 they increased in half a century to more than 100,000. Their instruction still remained vocational, but it had become more broad and thorough, and it was always practical. They had arisen to fill a need, and their success shows that they did accomplish the end they sought; namely, the preparation of men for business careers. In 1893, according to the United States Bureau of Education figures, there were 115,748 students enrolled in private commercial and business schools in this country. The number was probably much larger, in reality, for many of the smaller schools failed to report each year. Moreover, the fact that most of the private business schools called themselves "business colleges," and that some of them reported to the Bureau under the head of colleges, caused some confusion in the figures. After 1893-1894, the enrollment in the private commercial schools diminished for several years. This was due partly to general business depression. But another reason may be found in the fact that the private commercial schools were subjected to stronger competition from other sources. Public high schools, normal schools, and universities were offering commercial instruction. Some of them had done this even earlier. The Wharton School of Finance and Commerce was instituted in the University of Pennsylvania in 1881. A number of Public High Schools about the same time offered two-year courses for commercial students. But they had not proved very serious competitors up to 1893-1894.

## COMMERCIAL EDUCATION

In that year United States Bureau of Education statistics showed only 15,220 students pursuing commercial studies in public high schools, and the total in institutions other than private commercial schools was not much larger.

It was about this time that the new era of commercial education began in the United States. The years from 1892 to the present have been full of development and improvement, and the real history of commercial education in the United States may be said to be included within this period. In 1890 Professor Edmund J. James of the Wharton School in an address before the American Bankers' Association expressed his belief in the value of the university school of commerce and his ideas of what it should include. In 1892 he made a plea for the establishment of separate commercial high schools. In 1892 also, the Business Educators' Association, organized in 1878 in New York, and composed of teachers in private commercial schools, for the most part, became the Department of Business Education of the National Educational Association. In 1894 it held its first meeting at Asbury Park, and soon exerted a marked influence in systematizing and improving the work of the private commercial schools. It has also had a great deal to do with the improvements in commercial education in public secondary schools.

Until about 1900 progress was slow, so far as outward developments in commercial education are concerned, but a great deal was being done in a silent way both by educators and by business men all over the country. As was stated above, the private commercial schools had a period of decline after 1894. In 1898-1899 their enrollment was reported to be only 70,186. But with the opening of the new century they regained the former level, and from that time until 1908 steadily increased in number and in quality of instruction. In 1904-1905 the number of schools reporting to the United States Bureau of Education was 523, with 146,086 students enrolled. In 1907-1908 there were 558 schools, reporting 151,963 students; and in 1908-1909 there were 574 schools, reporting 146,288 students. The following year showed a further decrease to 541 schools with 134,778 students. Since the beginning of the century other lines of commercial education have shown even greater and steadier development. This development does not appear in the statistics of the Bureau of Education, from which it would seem that nearly 12,000 students were pursuing commercial studies in universities and colleges in 1905-1906, against less than 6000 now. This is due, however, to the above-mentioned confusion caused by private business schools reporting under the head of colleges until the last few years. At present a more rigid classification is made, and the figures are more reliable.

## COMMERCIAL EDUCATION

The complete statistics of the United States Bureau of Education for 1909-1910 showed the following conditions in the various branches of commercial education:—

CLASS OF INSTITUTION	NUMBER OF SCHOOLS	STUDENTS		
		MALE	FEMALE	TOTAL
Universities and colleges	66	5073	727	5800
Public and private normal schools	34	797	825	1622
Private high schools and academies	540	5753	4438	10,191
Public high schools	1440	35,155	46,094	81,249
Commercial and business schools	541	72,887	61,891	134,778
Total	2621	119,665	113,975	233,640

**The Private Commercial School.**— Even with the growth of other forms of commercial education, the private commercial schools still occupy a very important and necessary place, and will probably continue to occupy it. In aims and methods they differ little from the earliest schools of the kind: they still give vocational instruction, a substitute for apprenticeship. Every year they train hundreds of thousands of young men and young women in the use of the tools of the business professions. The only real differences now are in the number of tools and in the quality of instruction. The earliest schools taught chiefly bookkeeping and penmanship; those of the present time include not only these, but also commercial arithmetic, commercial law, correspondence, business forms, typewriting, shorthand, and sometimes others. Some schools give instruction in geography, spelling, and the like, but these are usually for the purpose of supplying deficiencies in preparatory training, rather than for any cultural value of their own. The scope of instruction in the best of the private business schools is indicated by the following suggestive outline, which was prepared by a committee of the Department of Business Education of the National Educational Association in 1895 and published by the United States Commissioner of Education in 1898.

Mathematics, (a) Bookkeeping, (b) Arithmetic.

Writing, (a) Penmanship, (b) Shorthand, (c) Typewriting.

Business, (a) Business Practice, (b) the History of Commerce, (c) Commercial Geography.

English, (a) Spelling, (b) Grammar, (c) Business Correspondence, (d) Composition and Rhetoric, (e) Public Speaking.

Civics, (a) Commercial Law, (b) Civil Government, (c) Economics.

In this suggested curriculum, bookkeeping was regarded as the foundation study. As a matter of fact few schools give instruction

in all the courses in this list, but that is largely because of lack of demand from the students. They usually desire only the more technical work.

Students who are graduated from these schools usually have sufficient mastery of the tools to enable them to earn a livelihood immediately. Many of them have attained high positions in the business world. The competition between the schools in large cities has been keen enough to raise the standard of instruction very decidedly, and the best of them now give a thorough and practical training in commercial subjects—a better training, indeed, than is given by the majority of public high schools along these lines. In addition, the worst evils of charlatanism have been eliminated. Aside from the somewhat narrow and technical character of instruction, the worst fault that still remains is in the mechanical methods that are used. There is too great an insistence upon rules, and too little upon principles. This fault is due to the very virtue of the schools, their practicality, which looks no farther than an immediate result. The performance of tasks rather than the solving of problems is the end that is sought. Similarly, externals are frequently regarded as of too great importance. The correct slant and uniformity of letters are high ideals to be gained. Of course it is true that many business men demand that kind of mechanical excellence in their subordinates rather than brains and initiative. Still it must be said that the commercial education of the private business schools is far from educational in its true sense. It trains the mind, but does little to develop it. In fine, these schools must be regarded only as trade schools. The frankest of them do not attempt to deny this fact. Instead they agree that this is their distinctive function, and claim that it is very necessary. They accomplish the results they aim at more completely than any other schools can. Whenever there is no longer a demand for this kind of training they will change their character, since they are forced to be self-supporting. But for present needs in vocational training they are sufficient. It is too much to expect that these schools will ever again lead the way in commercial education, but it is certain that they will not be slow to meet the new demands that are arising daily. Their existence depends upon it, and experience has already taught its lesson.

**The Public High School.**—Commercial education in the public schools is still in the experimental stage. It has never been conspicuously successful, nor has it until recently been of a kind that promised much advance from the private commercial schools. It has made its way with difficulty, and there is still a good deal of suspicion and some antagonism directed against it. In its history, the weak-

ness of our public educational system is made apparent. In the first place, our educational system has nothing of the compactness and unity of those of many foreign countries, notably Germany. Control is so largely local that there is difficulty in instituting a new movement with any degree of unanimity. Much time and energy is wasted by the several states and cities in making experiments, and much more time is lost in waiting for others to make the experiments. It was with difficulty that even such so-called "innovations" as music, drawing, and physical training obtained recognition as desirable factors in public school education. In a similar way, the introduction of commercial studies was retarded by the lack of any unified system, and the general conservatism of educators. Another objection was that there was no place for it. In the primary schools it was of course out of the question. The secondary or high schools were generally regarded as stepping stones to college, and were dominated by the classical element. Certainly commercial studies were not academic. And although only a small part of the students in the high schools went to college, it was felt that even those who did not should be given a substitute in the way of culture, so far as possible. There was no room for practical or vocational instruction. Nor were there any properly equipped teachers.

But the demand became too insistent to be unheeded. Many students left the public high schools early in their course to enter the private business schools, where they might obtain preparation for their future careers. Naturally there was some murmuring on the part of taxpayers, who felt that the public schools they paid for should give the education for which their sons and daughters asked, whether it looked toward a professional or a business career. Scientific courses were given in most of the larger high schools—why not commercial? In response to the demand, short commercial courses, of two years (and sometimes of only one) were offered in many high schools before 1890. The movement rapidly extended throughout the country. In 1893 there were 15,220 students in the United States in these courses; in 1895, there were 30,330. In the years 1893–1899 their numbers increased, while the enrollment of the private business schools decreased. This might seem to indicate that the courses were successful and were a good substitute for the private commercial school courses. Such was far from being the case. The majority of them were poor; some were bad. They had come because the demand was too strong to be resisted, but they had little encouragement from above. The public educational system had simply accepted them as a necessary evil, and had slavishly imitated the private schools. The methods and the quality of instruction were inferior. There was little

attempt to relate the cultural to the practical studies. A few new and alien branches had been grafted on an old tree, but they were poorly nourished by it and did not grow. The short commercial course in high schools was distinctly not a success, and began to fall into disrepute. The work of its graduates was compared unfavorably with that of regular four-year students. The private schools improved to meet the new competition, and far outstripped the public school courses, hampered as these were by all manner of difficulties. This is seen in the statistics of attendance. As has been said, the number of students pursuing commercial courses in the public high schools increased in 1893-1898, while that in the private commercial schools decreased. In the next five-year period, 1898-1903, both increased at about equal rates. In 1903-1908 the public high school enrollment in commercial courses seems actually to have decreased, while that of the private commercial schools increased. Doubtless the decrease was not so great as the government statistics make it appear, because of a change in the method of reporting. Indeed, the average number of students in the well-established commercial courses in public high schools has shown a fairly steady increase every year. For all that, the public school has not been a successful competitor of the private school in the latter's own field of short courses and purely technical training.

Within recent years, however, a movement has begun which promises to place commercial education upon a stable basis in our public school system. In many of the larger cities of the country since 1900 separate high schools of commerce have been established. As early as 1892, far-sighted educators saw the necessity of this, if commercial education were to be successfully undertaken. In that year Professor Edmund J. James, then of the Wharton School in the University of Pennsylvania, in a notable address before the convention of the American Bankers' Association at Saratoga, made a plea for the establishment of separate commercial high schools. Interest in the proposition grew, and although it was some time before results showed, there was a general tendency to lengthen and broaden the commercial courses then given in the public high schools. In 1898 the Central High School of Philadelphia founded a separate commercial school with an entirely distinct curriculum. Soon after, the High School of Commerce in New York was opened. Others followed in Pittsburg, Chicago, Brooklyn, Washington, and other cities. In the majority of these, the courses given were not materially different from those of the ordinary high school, except that the classical studies were generally omitted, and commercial branches were taught. They had the advantage of segregating students of common aim and of affording superior facili-

ties for work. The length of the course was ordinarily four years, instead of three, two, or one, as in the commercial course of the ordinary high school. Beyond these, there were no very great advances in them. They were better, but not essentially different from the earlier type. But in a few cities, notably Philadelphia and New York, a different plan was put in operation. There was some attempt to look behind the demand for commercial education, to the real need, and to fill it. It was a problem to be solved, and the school set itself to the task of solving it. If a business career was to be the goal, then all preparation should have that in mind. The whole course of study had to be reconstructed and made to serve an entirely different function from that of the classical high school. Not merely the commercial branches proper, but all the studies in the curriculum, should be adapted to business needs. This was the solution proposed. The development of the plan has been slow, partly because of the need of much experiment, partly because of the dearth of suitable teachers. It was not an easy task to change pedagogical methods to fit the new ideal. Some help was obtained from the study of German and other foreign commercial schools. The experimenting is still going on, and much remains to be done. There has been little outward change in the curricula of these schools recently, but inwardly there has been great development. For instance, in the foreign languages, a fair ability at speaking is regarded as more important than reading. In biology, chemistry, and the like the commercial importance is demonstrated. Throughout the list, the practical application of knowledge is made and new relations between the studies shown. The whole scheme is becoming a unit, rather than a mixture of conflicting elements. There are only a few high schools of this type in the country now, but two recently established high schools of commerce — that of Boston and that of Cleveland — are based upon this new idea of commercial education. Many of the older ones are gradually tending toward it. It is beginning to be realized by educators that, if vocational instruction is to be given by the public schools, it should be given whole-heartedly, and not in grudging acquiescence to a demand. It should prepare a student not merely to accomplish certain set tasks, but to grapple with new problems.

The five-year course of study of the High School of Commerce of New York City is as follows: —

FIRST YEAR. — Required: English (4); German, French, or Spanish (4); Algebra (4); Biology (with especial reference to materials of commerce) (4); Business Knowledge and Practice<sup>1</sup> (6); Drawing (second

<sup>1</sup> Including Local Industries and Government of the City of New York (2); Business Writing (2); Business Arithmetic, Business Forms and Methods (2).

## COMMERCIAL EDUCATION

half year) (1); Physical Training<sup>1</sup> (2); Music (1); Total, 26 periods.

SECOND YEAR. — Required: English (3); German, French, or Spanish (4); Plane Geometry (3); Chemistry (with especial reference to materials of commerce) (4); History<sup>2</sup> (with especial reference to economic history and geography) (3); Stenography (3); Drawing and Art Study (2); Physical Training (2); Total, 24 periods.

Electives: German, French, or Spanish (4); Bookkeeping and Business Forms (3); Business Arithmetic (1); Commercial Geography (1).

THIRD YEAR. — Required: English (3); German, French, or Spanish (4); Geometry and Algebra<sup>3</sup> (3); Physics (5); History<sup>4</sup> (with especial reference to materials of commerce) (3); Physical Training (2); Drawing and Art Study (1); Total, 21 periods.

Electives: German, French, or Spanish (4); Bookkeeping and Business Arithmetic (3); Stenography and Typewriting (3); Drawing and Art Study (2); Commercial Geography (1).

FOURTH YEAR. — Required: English (3); German, French, or Spanish (4); Economics and Economic Geography (4); History of the United States (with especial reference to industrial and constitutional aspects) (4); Physical Training (2); Total, 17 periods.

Electives: A Foreign Language (4); Advanced Chemistry (4); Economic Biology (4); Trigonometry and Solid Geometry (4); Elementary Law and Commercial Law<sup>5</sup> (4); Advanced Bookkeeping, Business Correspondence, and Office Practice (4); Stenography and Typewriting (4); Drawing and Art Study (4); Modern Industrialism (1).

FIFTH YEAR. — Required: English (3); Logic, Inductive and Deductive (3); Physical Training (2); Total, 8 periods.

Electives: A Foreign Language (4); Advanced Mathematics (4); Advanced Physics (4); Industrial Chemistry (4); Economic Geography (4); Nineteenth Century History, Europe and Orient, Diplomatic History, United States and Modern Europe (4); Banking and Finance, Transportation and Communication (4); Administrative Law and International Law (4); Accounting and Auditing (4); Business Organization and Management (4); Drawing (4); Advanced Economics (3).

It is too early to obtain more than a glimpse of the results of the new type of commercial secondary school. Undoubtedly it is an advance over the earlier. The instruction given is practical, but it is said that the cultural value of education is by no means lost. It is certain that there is a well-considered and intelligent purpose to meet the real needs of a large body of students for whom the classical high school offers no attractions. Some high schools go so far even as to plan their courses to meet the needs not only of those who will remain until graduation, but also of those who will leave after a year or two. High schools of commerce that are working along these lines report that they have a large proportion of students who would not attend any

<sup>1</sup> Including Physiology.

<sup>2</sup> First half year, Beginnings of Nations to 1300 A.D. Second half year, Modern History to 1750.

<sup>3</sup> In the second half year, students may elect additional Stenography and Typewriting or Bookkeeping in place of the second course in Mathematics, or may give double time to Mathematics by omitting either Stenography or Bookkeeping.

<sup>4</sup> First half year, English and Colonial History, 1620 to 1750. Second half year, Modern History (England and the Continent), 1750 to present time.

<sup>5</sup> Students who do not elect law in the fourth year may receive instructions in Commercial Law in connection with Advanced Bookkeeping.

## COMMERCIAL EDUCATION

other school, or would not stay for any length of time. The graduates find it easy to obtain positions in business life. In purely mechanical lines they are not so well prepared as those of the private commercial schools, but in capacity to acquire new knowledge and ability to use it they are far superior. Many of them, indeed, find the first-year work of excellent university schools of commerce almost elementary for them. This is merely because such schools are so few in number that the university schools have not been thoroughly correlated with them. They suffer from the general lack of unity in our education plan, which makes it difficult for the student to gain a coherent, consistent education from beginning to end, other than that which prepares for one of the well-recognized professions; such as law, medicine, teaching, and the like. A similar difficulty under which they labor is the dearth of well-trained teachers. These the university schools are beginning to supply. A beginning has at least been made, and it is not too much to expect that within the next decade the commercial secondary school will have become a very important part of our public school system, with a clearly defined relation to the other parts. More than that, it is probable that vocational schools of other types will have gained a firm footing, as they even now promise to do, under the leadership of the commercial high school. Many cities even now have vocational high schools of several distinct types.

**The University School of Commerce.** — Commercial education in the universities and colleges has fared somewhat better than the other types, so far as encouragement from above is concerned. But the encouragement has come usually from business men rather than from educators, and has met with only a half-hearted response until the beginning of this century. Educators have not been prompt to take the initiative in the movement. The conservatism that blocked progress in the secondary schools so long, retarded it in the higher schools. This is particularly true in the East. The older universities have been the last to yield to the tendency. Harvard has only recently instituted a School of Commerce under the title of a School of Business Administration. Yale, most conservative of all, has made no move in the direction of commercial education, in spite of the fact that a larger percentage of her academic graduates enter business than any other career, and the percentage is becoming greater all the time. It would seem that the East should be foremost in the commercial education movement, since commerce is there in its most advanced stage, and is more important than in any other part of the country. That it is not, can be due only to a lack of encouragement on the part of educators. For in the West commercial education has developed rapidly,

despite the lack of facilities. The state universities have tended toward the practical ideal from the outset, and where schools of agriculture flourished, schools of commerce could not fail to find a ready acceptance. These universities have been less hampered by traditions: they have therefore followed more easily the trend of demand.

The first school of commerce, to be sure, was established in the East. This was the Wharton School of Finance and Commerce, in the University of Pennsylvania, made possible in 1881 by the gift of Mr. Joseph Wharton of Philadelphia. Earlier than this, as early as 1866, in fact, an attempt had been made to establish such a school in the University of Wisconsin. This was by Robert C. Spencer of Milwaukee, who wrote to the Regents of the university pleading for commercial education as a part of the state university scheme. The attempt came to naught, however, and over thirty years passed before the University of Wisconsin entered the field of commercial education. The Wharton School was for nearly twenty years the only higher school of commerce in the country. The founder expressed the desire that the school should offer facilities for obtaining: (1) an adequate education in the principles underlying successful civil government; (2) a training suitable for those who intend to engage in business or to undertake the management of property. At the start the course consisted of only two years and was superimposed upon the first two years of the regular college course. Naturally there was a great deal of experiment necessary before any great degree of efficiency could be reached. In this the school had little assistance: it was forced to work out its problems alone. There were some failures, but on the whole, considering the disadvantages under which the school labored, a remarkable degree of success. In 1895 the course was enlarged to the full four years, although many of the academic subjects were still included. The scope of the work was broadened to include preparation for other lines of business than those mentioned in the statement of Mr. Wharton.

At present the school offers special training for the following vocations: manufacturing industry, banking and finance, brokerage, accounting, transportation and commerce, insurance, social and civil work, the law and the public service, private secretaryship. There is also a general course for students who do not feel able to choose definitely their future vocation by the end of the freshman year. The work of the freshman year is the same for all students, and is as follows:—

Political Economy (2); Resources of the United States (3); Accounting (3); Constitutional Law (3); English (3); Chemistry<sup>1</sup> (2); or Business Law (3).

<sup>1</sup>All students preparing for the manufacturing business are required to take Chemistry in the first year. They may elect Business Law as an extra subject.

The work of the school since its inauguration has gradually tended more and more away from the cultural and toward the practical. Courses in journalism and the like have been offered. An evening school has been established, giving instruction to men who are engaged in business during the day. The school has become one of the largest in the university. Recently there were 535 students in the day courses and 284 in the evening school. The degree of Bachelor of Science in Economics is given to students who successfully complete the four-year course. The school has been fortunate in having in its faculty at various times some of the strongest men in the country in the field of commercial education, and its contribution to other schools through them has been hardly less notable than its direct contribution to the business world. Many of its students have been trained for responsible positions in secondary schools of commerce both in this country and in South America.

Until about the beginning of the present century other universities were slow to follow the lead of Pennsylvania. The main reason, perhaps, was that there were few donors so generous as Joseph Wharton to establish schools of commerce. About the year 1900, however, there was a sudden springing up of these schools all over the country. Among the universities to establish them about this time were New York University, Dartmouth College, the University of Chicago, and the state universities of California, Wisconsin, Illinois, Michigan, Vermont, and others. Since that time growth has been rapid. The impetus in the new movement came from several different sources. In some it was the gift of some donor, as in the case of Dartmouth, where the Amos Tuck School was made possible in 1900 by the gift of \$300,000 by Mr. Edward Tuck of the class of 1862, as a memorial to his father. This benefaction was later increased. In the case of New York University, the State Society of Certified Public Accountants was largely instrumental in founding the school. In the state universities the schools were established through the regular channels. Within the past few years the movement has had a marked increase in breadth, which testifies to its success. Four new schools were opened at the beginning of the year 1908-1909. Harvard established a school more advanced in type than any of the earlier ones. A gift of \$500,000 to Tufts College has made a school of commerce possible there. That the higher schools of commerce in the United States are successful in accomplishing all that was expected of them, and more, seems established beyond the shadow of a doubt.

There are now three main types of higher schools of commerce—that is, of collegiate grade—in the country. These are differentiated by the relative proportion of the liberal,

or cultural, element and the practical, or professional, element, and in the relation which these two elements bear to each other. In the first type of school the liberal and the practical elements are given in coordination, and are about evenly balanced. In the second, the liberal element is given or required first, and the practical training is given afterwards. In the third, practical or professional training occupies a dominant position, and the liberal element is reduced to a minimum. The liberal training of the high school is regarded as sufficient for the purpose.

The Wharton School, and most of the schools of commerce in the state universities are of the first type. In many cases they are only branches of the colleges of arts, and the practical work is in the nature of applied economics. One of the best organized schools of this type is that at the University of Wisconsin, established in 1900. According to the statement of the authorities, "It was founded in the belief that in order to achieve the largest measure of success at the present time, and in order properly to perform his duties to himself and society, the business man needs not only a college education, but a course of study adapted to his peculiar needs. Justification for this belief was found in the magnitude, complexity, and rapidly changing character of modern industrial processes, and in the unfitness of the traditional college course properly to equip a young man for the most efficient work in this field."

The course of study includes three groups: (1) foundational studies, including natural science, mathematics, English, foreign languages, history, and economics; (2) professional studies, including business correspondence, business forms or documents, accounting, auditing, salesmanship, advertising, credits and collections, business management; (3) elective studies. In 1909-1910 the school had 237 students, of whom 95 were freshmen. In most of the schools of this type, the tendency has been to decrease the cultural element, and to increase the professional. This is seen particularly in the oldest school of the kind, the Wharton School.

Of the second type, the Amos Tuck School of Administration and Finance at Dartmouth College is the best example. It is a graduate professional school, following the four years of college work, but is so adjusted to it that the first year of the school, requiring for admission three years of college work, is equivalent to the college senior year, while the second year of the school constitutes a fifth year strictly graduate in character. The Tuck School confers the degree of Master of Commercial Science upon regular students who have completed the work of both years. Of these two years, the first lays emphasis on the practical aspects of business activity; the second includes strictly technical work and is more specialized.

The general business course includes the following subjects:—

FIRST YEAR.—First Semester: Accounting (2); French, German or Spanish (2); National Industrial Efficiency (2); Economic Geography (4); Statistics, (2); Money and Banking (3); Industrial Organization (3); Total, 18 hours.

Second Semester: Accounting (2); French, German or Spanish (2); Theory of Business Administration (2); Resources and Industries of the United States (4); Statistics (2); Commercial History and Policy (3); Transportation (3); Total, 18 hours.

SECOND YEAR.—First Semester: Accounting (2); French, German or Spanish (2); Commercial Law (2); Corporation Finance (2); Business Management (2); Practical Banking (2); Thesis (2); Total, 14 hours.

Second Semester: Accounting (2); French, German or Spanish (2); Commercial Law (2); Corporation Finance (2); Thesis (6); Total, 14 hours.

Special courses are also given in preparation for particular vocations; namely, foreign commerce, banking, transportation, insurance, and accounting. In these the work for the first year differs only slightly from that of the general business course, but in the second year there is a wider departure. Accounting, commercial law, corporation finance, and a foreign language are retained in all, however. Opportunity is afforded for a great deal of individual investigation of a practical character. The plan of the school is in close accord with that of the schools of law, medicine, etc., of the universities, and seems theoretically sound. The school, however, has grown but slowly, and to the close of the academic year 1910 had graduated only 56 students. From this it might appear that its type was too advanced for present-day demands.

Harvard's School of Business Administration is of the same type, however, and is, if anything, more advanced. A full college course is required for entrance. The degree of Master of Business Administration is offered to students completing the two-year course. Harvard's location is less disadvantageous for the purpose than that of the Amos Tuck School, and in the short period of its existence it has shown promise of usefulness. The severity of the entrance requirement is against rapid development, and because of it a large proportion of the students thus far have been specials. Many are active business men who come in from Boston and the vicinity to take one or two courses. The experiment of placing business on the level with law and other learned professions is too new to have received a thorough test, but it is at least being tried under the most favorable conditions.

Of the third type of school of commerce, that of New York University is the best example. It is a professional school, but, unlike those of the second type, is not distinctly a graduate school. Many college graduates do enter it, but the only real requirement is a four-year high school course or the equivalent. Sessions are held in the afternoon and evening only, in order that instructors and students

may both be drawn from those who are actively engaged in business during the day. The degree of Bachelor of Commercial Science is conferred upon students who meet either of the following requirements: (1) If they obtain satisfactory credit for 900 single hours of evening work, being 10 hours per week for three university years of 30 weeks each, and in addition satisfy the faculty that they have had at least two years' successful experience in business. (2) If they obtain satisfactory credit for 600 single hours of evening and 600 single hours of afternoon work, being in all 20 hours per week for two university years of 30 weeks each. When founded in 1900 the school was intended mainly to provide a scientific preparation for public accountancy. The scope has been broadened constantly since that time, until now preparation is given for all the business professions, including mercantile and manufacturing business, banking, brokerage, insurance, real estate, advertising. Preparation is also given for journalism and for the teaching of commercial subjects. The work is all of practical rather than cultural character, and is mainly elective. Certain requirements, however, must be met by each candidate for a degree. He must have passed successfully at least 120 hours in each of the four main groups of studies; namely, accounts, commerce, finance, and law. Some of these courses are prescribed. In fact, the work taken the first year by most of the regular three-year evening students is the same. It includes accounting, corporation finance, political economy, commercial law, and business organization. Later there is more specialization. The experiment of offering courses of university grade in the evenings did not at first meet with the approval of educators. Experience has demonstrated, however, that successful work can be accomplished under this plan, and that it has certain great advantages in commercial education. It has enabled the school to meet the needs of a large body of men in New York City and to offer them a higher grade of instruction than could be afforded in any other way. The quality of work done by them is apparently up to the standard of the best schools of commerce in the country. The growth of the school has demonstrated its fitness to conditions. From 60 students in 1900-1901 it has grown until in 1910-1911 there were over 1100, a greater number than were enrolled in any other university school of commerce in the country. Of these about half were part-time students. Of the regular students in 1910-1911, 113 were college graduates and 67 came from foreign countries.

The success of the experiment in the New York University has led to the foundation of similar schools elsewhere. The University of Pennsylvania introduced an evening school of the same type. Others have been started at Northwestern University and University of

Denver, and there are indications of similar movements elsewhere. This type of school would almost necessarily be situated in or near a large city, and in such a situation it seems to be the type most urgently demanded. All three types have been successful enough to lead to the belief that they are rendering a distinct service and a service that will constantly increase in the future.

In addition to the schools already mentioned, there are others giving commercial education of various grades. Several privately endowed institutions, such as the Drexel Institute (*q.v.*) in Philadelphia, give instruction that is more liberal and more advanced than that of the ordinary private commercial school, but is hardly of university grade. Many schools give courses by correspondence, and some of these have reached a high plane of usefulness.

From the foregoing discussion it may be seen that almost every conceivable grade and kind of commercial education is now given in the United States. Indeed, it is doubtful if any other country can offer so wide a range. The chief weakness is that there is no coherent system by which a student may prepare consistently for a business career throughout his education. The next step in advance will be to coordinate the various elements and bring them into closer relation with each other. When this is done the United States will have a system of commercial education second to none in the world.

**Germany.** — The supremacy of Germany in commercial education is as generally conceded as her high place in commerce itself. Which was the cause of the latter is a matter of some dispute, but there is no doubt that each assisted the other to a marked degree. Her growth and development in the two fields has been rapid and simultaneous since the latter part of the nineteenth century, especially since 1887, which marked the beginning of Germany's real advance in commercial education. The result has been manifested in the most complete and comprehensive scheme of commercial education in the world. Its salient features are the close relation of its several parts and its breadth of outlook. The system in Germany's education has long been the envy of foreigners. The whole structure is admirably planned to give a unified and thorough preparation for any calling in life. It is fostered and controlled by the government, and thus secures not only provision for all classes of students, but also a harmonious interrelation of the several schools. The *Realschulen* and *Oberrealschulen* are credited with the foundation of the scheme of commercial education, because they have been kept constantly in touch with changing needs, and have therefore supplied preparation that is not too rigidly classical in character. The strictly commercial education, however, is given mainly by

three types of schools, corresponding roughly to the three main types in the United States; namely, the private commercial school, the public secondary school, and the university. In Germany the three main groups are the continuation school, or school for apprentices, the middle commercial school, and the higher commercial school.

The continuation schools (*Fortbildungsschulen*) (*q.v.*) are found in almost every city or town of importance in the German empire, to the number of over 650. Their province is to give apprentices who have left school at about the age of fourteen an opportunity, while learning their trades, to acquire theoretical knowledge which will be useful to them and enable them to rise in the scale of their work. Sessions are held in the morning, from 7 to 9, or in the afternoon, and the instruction is generally about 10 hours a week for each student. The subjects taught include German, English, French, and sometimes other modern languages, commercial arithmetic, study of commerce, bookkeeping and correspondence, geography and penmanship. Attendance at these schools is in the majority of cases compulsory, and extends over a period averaging about three years. The employer is held responsible for the attendance of his apprentices, and for the tuition, wherever a fee is charged. Most of the schools are supported, however, by the city authorities or by the chambers of commerce. In some cases they are supported by the body of those benefited by them. One at Hamburg, for instance, is wholly paid for by the *Verein für Handlungskommis* (Society for commercial clerks). At this school Danish, Russian, Portuguese, and Spanish are taught, as well as the languages mentioned above. Some of the schools are connected with the middle schools of commerce, and others are independent. The middle school of commerce corresponds to our commercial secondary school. Students are taken at about the age of fourteen or fifteen, and usually remain three years. They receive a completion of their general education, and also technical knowledge that will be useful in the business professions. Those who have completed a general high school course already may take a short course in technical subjects. Those who receive the diploma and complete their terms of apprenticeship are eligible for admission in the higher schools of commerce. These middle schools are probably no better than the best high schools of commerce in the United States, but they are of more uniformly high level. They number more than 200. The quality of instruction is particularly good, as every teacher has had special training and nearly all of them are men. They differ in plan of organization and in manner of support. That at Leipzig, which is typical, is supported partly by students' fees, partly by income from endowment, and partly by the government. Any deficit is met by private subscription.

Higher schools of commerce in Germany are of recent growth, as recent indeed as those in the United States. The first movement was made in 1879, headed by Gustav von Mevissen; but it did not result in anything definite for some years. The first higher school of commerce was not established until 1898. This was at Leipzig, and came as a result of the second Congress of Commercial Education held there in June, 1897. Responsibility for the school was assumed by the Leipzig Chamber of Commerce, with the support of the Saxon government. The degree of coöperation involved in the enterprise is indicated by the classes of men represented in the senate which controls the school. There is one member of the Saxon government, one of the municipality of Leipzig, the president and two other members of the Chamber of Commerce, three professors of the University of Leipzig, two teachers of the Middle Commercial School, and a director of studies. The purposes of the Leipzig school were stated as follows: (1) To give to young men who already possess a certain degree of mental maturity a wide and thorough general and commercial education. (2) To give to professors and teachers already instructing in commercial schools, an opportunity to perfect themselves theoretically and practically in any particular branch. The school was a success from the start, and at the end of the first five years of its existence had over 500 students, of whom nearly one half were foreigners. Among subjects taught are theoretical and practical political economy, including coinage, weights, measures, banking and stock exchange business, commercial politics, commercial statistics, credits, transportation and insurance, the science of finances, including taxation, public credit and customs duties, knowledge of substance of goods and technology, commercial geography, economic history, general law knowledge, commercial law, law of exchange and maritime law, bankruptcy, international law, colonial policy, eight modern languages in advanced stages, etc. From this it may be seen how broad and comprehensive the plan of the work is. It is particularly notable that there is a tendency to regard commerce as not merely an internal matter, but a matter of world-wide scope. The outlook here, and in fact in all German commercial education, is far broader than in that of any other country. The significance of this fact in relation to the extension of Germany's commerce can hardly be overestimated. The School at Leipzig was at first conducted in the building of the Middle School, but in 1902 it obtained a home of its own. In the meantime similar schools had been founded in Cologne in 1900, and in Frankfort in 1901. Others soon followed, the most important of which is at Berlin. They differ in minor particulars, but in general their aims are similar. The school at Cologne has a more definite plan than some of the others, and has had the

largest attendance. The diploma requires two years' study. A great deal of specialization is allowed at these higher schools, and the student is encouraged to think for himself. A frequent criticism of German education has been that it did not do enough of this; its system made the work too mechanical and disciplinary, and did not leave sufficient room for the development of the individual. This may be a just criticism of the system as a whole, but it seems not to be true of the higher schools of commerce.

As a whole, Germany's commercial education seems to have reached a remarkable degree of perfection, and is sufficient answer to those who claim that commercial schools are lowering the ideals of education. For Germany has maintained her position in other fields of education without difficulty, in spite of her advancement here. The classical and scientific have not suffered because of the commercial. And Germany's progress in the field of commerce, especially in that with foreign countries, has received great stimulus and help from it.

**Other Countries.**—Imperfect as are the systems of commercial education in Germany and the United States, those of other countries are even less advanced. England is far behind, a fact which has caused no little uneasiness among English business men. The chief hindrance to progress is the examination method which has been in vogue there so long, and which naturally has given little incentive to improvement of instruction. Examinations in commercial subjects are conducted by the London Chamber of Commerce, the Society of Arts, the Institute of Chartered Accountants, the Institute of Bankers, and many other bodies, each for its own aims and in its own way. There was little coöperation between the bodies, although this defect is being remedied. But because of this unfortunate system, schools have been devoted too much to cramming, and development has been individual and slow. Up to the beginning of the present century there was little commercial education worthy of the name. Even now, although there are almost innumerable varieties of commercial schools, few are comparable with similar ones in Germany and the United States. Continuation schools have been established and recognized by the Department of Education. They give evening instruction of a rather elementary kind in commercial subjects. There are a number of private business schools, notably the Pitman School, similar to those in the United States and equal to the best of them. Secondary schools of commerce have been established in a few large cities, through the efforts of the chambers of commerce and other commercial bodies. The London School of Economics and Political Science, founded in 1895 and supported at first by the Technical Education Board of the London County Council, gave higher commercial instruction of a rather liberal character. In 1900 it was admitted into the University of

London. Courses covering a wide range are given, and the degrees of Bachelor of Science and Doctor of Science are conferred upon successful candidates. Other university and college schools of commerce, most of them of a more professional character than that at London, have been established in Liverpool, Manchester, Leeds, Birmingham, and other cities. The evening courses have met with a fair degree of success. There is still a great lack of organization in the various types of schools, and indeed the types are by no means well-defined.

France has a few old and well-established schools of commerce, but on the whole the number of students in commercial education is surprisingly small, and the system is not very extensive. There are continuation schools with evening sessions under government supervision, in which instruction is given in commercial and industrial subjects. Private commercial schools like those in the United States are also found in many cities. The chambers of commerce are responsible for three other types of commercial education: (1) Free evening classes; (2) secondary commercial schools; (3) higher commercial schools. Of the third type, the School of Higher Commercial Studies at Paris is the most advanced. It presumes a fair degree of maturity in the students, and the number of these is limited. A two-year course is given of about the grade of university schools of commerce in the United States. Emphasis is laid upon instruction in languages, accounts, commercial geography, commerce, and commercial law. There are more than a dozen other higher schools of commerce in France. Some are among the oldest in the world, but they are not considered to be on a par with Germany's. It is said that government supervision has retarded instead of assisting them. Many of the schools in France, notably that at Lyons, and some in other countries, as at Antwerp, give technical, or productive, instruction together with the commercial.

Austria and Belgium have practical and thorough systems of commercial education. Belgium is credited with having established the first commercial school of true university grade at Antwerp in 1853, and the work has been kept up to date. Switzerland has an excellent high school of commerce. Other countries all over the world are active in establishing schools of commerce, and even South American countries have felt the force of the movement, which promises to become worldwide.

**COMMERCIAL SCHOOLS.** — See COMMERCIAL EDUCATION.

**COMMISSIONER OF EDUCATION.** — A term practically synonymous with Superintendent of Schools; Superintendent of Education; Superintendent of Public Instruction; or Superintendent of Common Schools. It is used to designate the head of an executive department of education in a state, or in the nation; as, for example, the United States Commissioner of Education (*q.v.*); the Commissioner of Education for the State of New York; the Commissioner of Education for the State of Massachusetts; or the County School Commissioners of the State of Georgia.

**COMMISSIONS, EDUCATIONAL, RECENT AMERICAN.** — As applied to education the word "commission" has recently come into frequent use as a generic term to designate certain special boards or committees constituted for the purpose of making investigations and reports upon particular issues of moment, or of administering special educational activities. Indeed, from a survey of current educational terminology it might be concluded that this word has been substituted for the former term, "committee." Owing to the wide difference in origin, purpose, and character of these recent commissions, it is difficult to classify them satisfactorily. From the several points of view, however, they may

be grouped as follows: as to scope of operation — international, national, state, or local; as to function — administrative, or investigative and advisory; as to duration — permanent or temporary; or as to status — legal or extra-legal; and as to personnel — lay or expert.

**State Commissions.** — The administrative or supervisory commissions usually form a part of the permanent statutory state system of school government, and are created to direct or develop some particular activity or division of the educational organization. This type is well represented in the state and county textbook commissions existing in many states for the purpose of selecting and adopting uniform textbooks (*q.v.*) for elementary and secondary schools. They are generally composed, in part, of certain state and local educational officers, *ex officio*, and, in part, of appointed representatives of the several different classes of public schools. The trend of current legislation is for the organization of special commissions for this purpose. Within this group belongs also such administrative boards as the Commission on Industrial Education, created by the legislature of Massachusetts in 1906 for the purpose of establishing and supervising independent industrial schools. This commission was consolidated with the State Board of Education in 1909. The predecessor of this last-named commission was the Commission on Industrial and Technical Education, a temporary organization created by legislative action in 1905, and composed of nine representatives of manufacturing, agricultural, educational, and labor interests to "investigate the needs for education in the different grades of skill in the various industries of the commonwealth." The investigations and report of this commission resulted in the establishment of the whilom permanent commission. The School House Commission created by the Utah legislature in 1909 for the approval of plans of school buildings may likewise be placed in this group.

The most important of state commissions, and the type of organization to which the term "educational commission" has been most appropriately applied in recent years, are the special bodies instituted recently for the express purpose of revising the general body of laws pertaining to the public school system, or of making special investigations, and presenting recommendations concerning needed legislation. Commissions of this sort have existed recently in Arkansas (1910), Delaware (1909), Colorado (1910), Connecticut (1903 — industrial education, and 1907), Kansas (1907), Idaho (1909), Illinois (1907), Indiana (1907), Iowa (1907), Kentucky (1908), Maine (1909 — industrial education), Maryland (1908 — industrial education), Michigan (1909 — industrial education), New Jersey (1907 — industrial education), North Dakota (1909), Ohio (1907 — school revenue), Pennsylvania (1907), South

Carolina (1910), Tennessee (1907), Vermont (1906 — permanent school fund), Virginia (1908, 1910), West Virginia (1906), Washington (1907), and Wisconsin (1910 — industrial). Excepting those in Arkansas, Colorado, Kansas, Indiana, and Ohio, these commissions were created by the authority of the state legislatures. The Connecticut and Tennessee commissions were created from joint legislative committees. The others were constituted in various ways, the tendency being to appoint professional representatives. The Kansas commission of 1908 was appointed by the governor of the state at the instance of the state teachers' association "to investigate carefully present educational conditions and to recommend such legislation as in its judgment is most needed." The Indiana commission of 1906 originated and was appointed in a similar way, "to investigate the question of school taxation and teachers' salaries, and all other educational questions which may rightfully come before such a body." The Ohio commission of 1907 was an independent organization representing the state teachers' association. Each of these three commissions made a special report. The commissions in Arkansas, Colorado, Illinois, Iowa, Kentucky, Tennessee, Pennsylvania, South Carolina, West Virginia, and Washington were instituted for the primary purpose of revising and simplifying the laws governing the educational organization. The spirit of this movement for the better adaptation of the educational organization to modern needs is well indicated by the duties assigned to the Illinois commission, "to make a thorough investigation of the common school system of Illinois, and the laws under which it is organized and operated; to make a comparative study of such other school systems as may seem advisable, and to submit to the forty-sixth general assembly a report including such suggestions, recommendations, revisions, additions, corrections, and amendments as the commission shall deem necessary." In a number of instances the investigations and recommendations of the commissions have formed the basis of a considerable body of constructive legislation. Among the conspicuous exceptions during 1909, however, were Iowa, Illinois, and Pennsylvania, in which states the legislature failed to consider favorably the major recommendations of the commissions.

**Local Commissions.** — The following local commissions are enumerated as typical of different contemporary educational movements: (1) Boston Board of School House Commissioners, created by the legislature in 1901 for the purpose of controlling and administering public school buildings and grounds of that city; (2) Chicago Educational Commission (*q.v.*), authorized by the city council, December, 1897, and appointed by the mayor, January, 1898, for the purpose of investigating and recommending changes in the organization of the public

school system: (the report of this commission is the most comprehensive analysis of municipal school organization yet made); (3) Cleveland Educational Commission: a citizens' committee, appointed by the Board of Education in 1905, "to examine carefully the government, supervision, and course of study of the Cleveland public schools." (4) New York Teachers' Salary Commission, appointed by the mayor in 1909 to report regarding the equalization of the salaries of men and women teachers in public schools; (5) Pittsburg Teachers' Salary Commission, created by the Central Board of Education in 1904 for the purpose of regulating promotion and compensation of teachers in the public elementary school. This commission, composed of representatives of the supervisory and teaching force, was declared illegal in 1908 (see *Houston v. Central Board of Education of Pittsburg* 68 A, 1036); (6) Washington School House Commission, created by Congress in 1906 (Public Act No. 251, Fifty-ninth Congress, first session) for the purpose of submitting a general plan for the consolidation of the public schools of the District of Columbia and a general plan for the character, size, and location of school buildings.

**Associational Commissions.** — A number of educational associations and other extra-legal organizations have, in recent years, appointed special investigative committees. The following examples of these committees, to which the term "commission" has been attached, may be regarded as typical: (1) National Commission on the Teaching of Physics (1907), composed of representatives of 14 associations for the study of the problems of the teaching of physics; (2) Commission on College Entrance Requirements in Latin (1908), composed of 15 representatives of classical associations, colleges, and secondary schools to formulate definitions of such requirements; (3) International Commission on the Teaching of Mathematics, formed at the Fourth International Congress of Mathematics, Rome, 1908, for the investigation of the teaching of mathematics; (4) Commission on Accredited Schools and Colleges, established by the North Central Association of Colleges and Secondary Schools in 1901 and composed of representatives of both classes of institutions. Its purpose is to bring about reasonable uniformity in the requirements for admission to college.

**National Commissions.** — Education in the United States is so much a state affair that, aside from independent professional organizations having a national scope, commissions created by Federal sanction and dealing directly with educational matters would be regarded as unnecessary and inexpedient. Nevertheless, certain of the recent Federal commissions have investigated and reported upon issues that can but be classified as educational. Of these may be specifically mentioned the Immigration Commission (1907 — report 1911), the

## COMMISSIONS

Country Life Commission (1908), and the National Conservation Commission (1909 — chapter on National Vitality).

**International Commissions.** — While not a part of the American educational structure, the recent inspection of and reports upon American schools by official and unofficial commissions representing foreign nations have not been without their influence. The Mosely Educational Commission (*q.v.*) from England in 1903 and the Royal Prussian Industrial Commission in 1904 are probably the more prominent of these commissions.

Broadly speaking, the educational commission is representative of an endeavor to democratize and to unify the organization of education through intelligent and widespread coöperation; and to base the organization of the public school system upon the results of thorough and intensive investigations of the conditions and factors influencing educational efficiency.

**COMMISSIONERS, BOARDS OF SCHOOL.** — A term practically synonymous with Boards of Education, when used for the managing board of a city school system, as, for example, the Board of School Commissioners for the city of Baltimore, or the city of Indianapolis.

See **CITY BOARDS OF EDUCATION**, and the special articles on the cities mentioned.

**COMMISSURE.** — See **NERVOUS SYSTEM**.

**COMMITTEE OF SEVEN, OF EIGHT, OF FIVE.** — Committees appointed by the American Historical Association, which reported on the study of history in schools in 1899, 1909, and 1911 respectively.

See **HISTORY**; **COLLEGE REQUIREMENTS FOR ADMISSION**.

**COMMITTEE OF FIFTEEN, THE.** — In 1893 the National Educational Association appointed a committee of fifteen members, under the chairmanship of Superintendent William H. Maxwell of New York City, to investigate three principal topics connected with elementary education, viz. The organization of a school system; the coördination of studies; and the training of teachers. The committee divided itself into three subcommittees, and prepared lists of questions designed to draw out expert opinions. On the various topics presented a series of conferences followed, and the conclusions of the committee were formulated. In general, it may be said that the recommendations regarding the organization of city school systems have constituted the basis for considerable reform in this field. The subject of the coördination of studies was complicated, and the recommendations in this field have had relatively little effect. D. S.

**COMMITTEE OF TEN, THE.** — The committee (of ten) on secondary school studies was appointed by the National Educational Association on July 9, 1892, under the chairmanship of President Charles W. Eliot of Harvard University. The general object in the appointment of the committee was to secure desirable uniformity in school programs, and in requirements for admission to college. The committee was directed to provide for conferences (nine in number), on the principal subjects which enter into high school curricula, and, on the basis of their reports, to prepare a general report, with recommendations. This

is commonly known as the *Report of the Committee of Ten*. A series of questions bearing on the organization and conduct of the subjects of the curriculum were made the basis of the special reports, in addition to which, two questions bearing on educational advantages were submitted to the conferences. Of these, the inquiry as to whether a subject should be treated differently for students going to college, and for those making a high school education their last training, excited the widest discussion.

The report was one of the most celebrated ever made in the country, and, for a number of years, constituted a point of departure in the organization of high school curricula. Its effect was to supersede, in many secondary schools, a program of short and miscellaneous courses by a program of relatively few subjects, carried for four or five hours per week, and for at least a half year. It caused colleges to translate their admission requirements in terms of units of the work thus offered. It undoubtedly led to considerable uniformity in secondary curricula throughout the country and in college admission requirements. Other recommendations involved, such as the correlation of certain subjects and a Saturday half session for science, have not been realized in practice.

The report raised the question of educational values in an important way. While directing attention to the fact that the college receives but a small proportion of the pupils of the secondary schools, the report lays stress on the idea that teaching should not be varied according as the pupil is to enter college or not. That was emphasized on the ground that the educational value of one subject was the equivalent of that of another, provided each were taught with equal seriousness and for a sufficient length of time. This theory of the equivalence of educational values, which to a large extent seems to rest on the doctrine of formal discipline, provoked extensive discussion and disagreement. There is yet by no means unanimity of opinion as to the propositions laid down in the report.

The reports of the conferences have constituted valuable bases for the discussion of method, but in this field, the progress has been such as to render subsequent revision necessary.

**COMMITTEE, SCHOOL.**— A term commonly used in the New England states for what is called elsewhere a Board of School Trustees or Board of Education. The term has a historical significance in New England, as is explained at the beginning of the article on City School Administration (*q.v.*).

**COMMODIANUS.**— Church Father and poet, born at Gaza in Syria about A.D. 200, of heathen parents, and educated in pagan schools. By the reading of the Bible he was led into Christianity, of which he became a teacher and ultimately a bishop in the North African Church. He was one of the earliest of the Latin poets of the Church, constructing his verses with reference to accent rather than quantity. His style lacks the elegance of classical Latin and the technical precision of the Greek theologians, but his writings are marked by deep practical piety. Like the Western theologians, he prefers to deal with man and his needs rather than to speculate about God, as do the Orientals, and he has no use for Greek philosophy. But two of his works are still extant. His *Instructiones* consist of 80 acrostics of an apologetic, polemical, and parenetical character, written about 338. His *Carmen Apologeticum* against Jews and Gentiles was written in 249, and consists of 1043 verses discussing the doctrine of God, Man, and the Saviour. The best edition of these is that of Ludwig, Leipzig, 1878. The *Instructiones* are translated in the *Ante-Nicene Fathers*, Vol. IV. They are somewhat crabbed in style, but form an interesting example of early Christian poetry, and illustrate the attitude of the Latin Fathers toward Greek culture and philosophy, which culminated in the violent hostility of Tertullian and Augustine toward all pagan learning. **COMMON LAW IN ENGLISH EDUCATION.**— The universality of church control (see CHURCH SCHOOLS) over national education was undoubted until after the Black Death (1349) (see BLACK DEATH AND EDUCATION), but after that date, and indeed a little before, we see coming into existence a new attitude of the State toward education. In 1346, in the *Ferndon Grammar Schools Case*, the Crown declared that all pleas relating

to the patronage of grammar schools belong to the crown courts and are not to be heard in the spiritual courts (*Registrum Brevium*, fol. 35). That is the first we hear of the common law in relation to education. In 1391 the Crown refused to grant a petition that no unfree child should be allowed to attend school (3 *Rot. Parl.* p. 294, 15 Ric. II, 39). In 1393 there appears a petition from the Archbishop of Canterbury, the Bishop of London, the Dean of the Free Chapel of St. Martin-le-Grand, and the Chancellor of the Church of St. Paul's, London, alleging their complete control over grammar teaching in London, stating that unlicensed masters were nevertheless holding general schools, and further that they had consequently proceeded against these masters in the spiritual court and that these masters had thereupon gone to the secular court asking that they might hold their schools without the consent of the Archbishop, Bishop, Dean, and Chancellor. The petition went on to ask that the Privy Council should restrain the secular court from interference, and that the matter might be settled in the spiritual court according to law and custom (3 *Rot. Parl.*, 324). How strong the secular court had become may be judged from the fact that the King never answered the petition from these important personages. The next stage was the passing of the important act of 1406, which declared "that every man and woman of what state or condition that he be, shall be free to set their son or daughter to take learning at any school that pleaseth them within the realm." (7 Hen. IV, c. 17. See also 3 *Rot. Parl.*, p. 602.) From this time forward the common law maintained the right of every child to education, though that right did not impose a duty on the parent to give his child education. The case of *Hodges v. Hodges* decided in 1796 (Peake's *Reports*, Vol. II, p. 79) that no legal duty attached to parents in this matter, and this duty was not in fact imposed until the passing of the Education Act, 1876, 470 years after the first statute of education.

The next question with which the common law had to deal was the right of teachers to teach, and this was considered and decided in the famous *Gloucester Grammar School Case* in 1410. (See *State Intervention in English Education*, pp. 50-60.) This case decided that by the common law of England no person with the necessary intellectual qualifications could be restrained from teaching school where he pleased. The case (the report of which is in the *Year Book*, II, Hen. IV — the text is reproduced in *State Intervention in English Education*, pp. 241-242) is one of the most important early documents in the history of English education. It was an action of trespass brought by two masters of the Gloucester Grammar School against the master of another school in the town claiming damages for the infringement of their alleged monopoly. The case was decided on two grounds: first that no cause of action

was shown, and secondly that the action, if triable at all, could only be tried in the spiritual courts. On the first point Mr. Justice Hill said: "There is a fundamental failure in this case to maintain action inasmuch as the plaintiffs have no estate but merely an uncertain ministry like any other person who, being as well qualified as the plaintiffs are, comes to teach youth. It is a virtuous and charitable thing to do, helpful to the people, for which he cannot be punished by our law." A more explicit statement of the common law can hardly be imagined. As to the second point no doubt in the year 1410 the education and teaching of children was, as it is by many still, regarded as "a spiritual thing," but it is to be noticed that the Chief Justice does not base his judgment on the general ground that educational questions were only cognizable by the ecclesiastical courts; the claim is formally founded on the appointment of the plaintiffs by local ecclesiastical authority and must stand or fall by the right of that authority according to ecclesiastical law to make that appointment; therefore *il semble que cest action ne puit estre trie en cest Court*. But the principal grounds for the decision are those given by Mr. Justice Hill and Mr. Justice Hankeford. "To teach youth . . . is a virtuous and charitable thing to do, helpful to the people, for which he cannot be punished by our law"; "it would be contrary to reason that a master could be disturbed from holding school where he pleased." It has been necessary to consider the question at length, as it is impossible to understand subsequent educational developments in the sixteenth, seventeenth, and eighteenth centuries without clearly appreciating the enunciation of the common law of education. This will be best understood by reference to another important law case, that of *Matthews v. Burdett*, which was argued on the Queen's Bench in 1702. In that case Dr. Lake, a civilian, argued with great force that schoolmasters were not under the control of the Church. He alleged that a schoolmaster was originally a layman and under the control of the civil magistrate. He is here referring to the schoolmasters in Roman times, who were undoubtedly appointed by the local authorities under the Edict of Gratian of the year 376. He went on to say "that the common law takes no notice of it" (the schoolmastership) "but as temporal," and takes as his authorities the *Ferndon Grammar Schools Case* of 1346 and the *Gloucester Grammar School Case* of 1410. He (wrongly) alleges that there was no common law requiring a license till the Third Council of Lateran (1215). He then goes on to argue with force that "the several Acts of Parliament which require the school-master's taking a license from the Bishop, shew it was not necessary before, nor was there any great Usage or Practice that can be made appear. Vide 23 Eliz., c. 2; 1 Jac. I, c. 4; 14 Car. II, c. 4." Cowper, the counsel on the other side, quoted

Lyndwood, the statute *de comburendo heretico* (7 Hen. IV, c. 15) and immemorial usage as the authorities for church control. No decision was ever given in this case, but it is to be noted that Cowper did not meet Lake's plea of the common law. We shall see directly that by this date the common law had become fully operative. But first a word as to the question of church control and the common law after the Reformation. There is no legislation as to the church control of schoolmasters until the year 1581, when by 23 Eliz. c. i., secs. 6, 7, it was enacted that "if any person or persons, Body Politick or Corporate, after the Feast of Pentecost next coming, shall keep or maintain any schoolmaster which shall not repair to church as is aforesaid, or be allowed by the Bishop or Ordinary of the Diocese where such schoolmaster shall be so kept, shall forfeit and lose for every month so keeping him, ten pounds," and "provided that no such Ordinary or their Ministers shall take any thing for the said allowance; such schoolmasters or teachers, presuming to teach contrary to this Act, and being thereof lawfully convicted, shall be disabled to be a Teacher of Youth, and shall suffer Imprisonment without Bail or Mainprise for one year." Thus the statute law ousted the ecclesiastical jurisdiction, though this point was questioned later. It would be difficult to find an ecclesiastical prosecution for teaching without a license in the sixteenth century before this act. But under the statute prosecutions began. Thus on May 1, 1584, a jury at the Middlesex Sessions found a "True Bill that William Smithers *alias* Smithurse of the parish of St. Bottoles in the liberty of the Charterhouse near London, from the said day to first of July next following doemit, Anglice kepte a common scole in *Capell* de Charterhouse predict without the license of the Bishop or Ordinary of the Diocese" (*Middlesex Sessions' Rolls*, Vol. 1, p. 149). Here the State is taking up by statute the part played by the Church in the fourteenth century. The necessary inference is that the common law was too strong for the Church. But the act of 1581 evidently failed to check the unlicensed teaching that was protected by the common law, for in 1604 (1 Jac. 1, c. 4, sec. 9) the law was greatly strengthened. The section provided "that no person after the Feast of St. Michael the Archangel next shall keep any school, or be a school-master, out of any of the universities or colleges of this Realm, except it be in some public or free grammar school, or in some such nobleman's or noble-woman's or Gentleman's or Gentlewoman's House as are not Recusants, or when the same School-master shall be specially licensed thereunto by the Archbishop, Bishop or Guardian of the spiritualities of that Diocese; upon pain that as well the school-master, as also the party that shall retain or maintain any such school-master contrary to the true intent and meaning of this Act, shall forfeit each of them for every day

so willingly offending, forty shillings." The Act of Uniformity of 1662 made the statute law still more stringent. The spiritual control of schoolmasters was tightened to the breaking point. Section 6 ordered every schoolmaster and tutor to conform to the liturgy, and Section 7 provided that schoolmasters teaching in private houses without license should suffer three months' imprisonment for the first offense and the same term with a fine of five pounds for the second and third offense. These statutes operated side by side with stringent episcopal articles in various dioceses as to licenses, and with Canon LXXVIII of 1604, which had made the episcopal license necessary for all teachers. The Five Mile Act of 1665 forbade all Dissenters to teach at all, while Archbishop Sheldon set up in his province an inquisition into the faith of all teachers public or private. The position had become intolerable, and the question arose whether the common law of education could assist the common people. The first stage of the new movement was the usual English stage. Juries refused to convict. Thus on Mar. 27, 1674, a true bill was returned against a schoolmistress, Frances Bedingfield, for teaching without a license. On Apr. 27, Frances put herself upon a jury of the country, and on July 15, 1674, the jurors declared her "not guilty." Again in January, 1683-4, at Finchley in Middlesex, Austin Swift, schoolmaster, did the same thing and the jury found him "not guilty." That was the inconvenience of a trial by a common law court. Consequently the ecclesiastical courts reopened their doors, with the result that the common law courts of Westminster secured their opportunity and brought the weapon of prohibition into play. These courts found divers ways to evade the statute law and give the common law free play. In 1670, in *William Bates's Case* (*Ventris' Reports*, Vol. 1, p. 41) the King's Bench granted a prohibition to the Commissary of the Archdeacon of Richmond, who had endeavored to eject Bates for teaching without a license. The court held that as Bates had been presented by the founders of the school, the ecclesiastical court could only *censure* him. In the case of *Chedwick v. Hughes* in 1699 (*Carthew's Reports*, p. 664) it was held that when there was a civil remedy (under 1 Jac. 1, c. 4, s. 9) a suit in the ecclesiastical courts would not lie. Here we have a second limitation on the courts spiritual; and yet if the authorities applied for a civil remedy juries would not convict. But the courts were prepared to go much farther than this. In *Cox's Case* (*Peere William's Reports*, Vol. 1, p. 29), decided in the year 1700, it was held that the old ecclesiastical jurisdiction only applied to grammar schools, and that it did not and never had applied to elementary schools, such as reading and writing schools. A prohibition therefore issued quashing proceedings against Cox in the spiritual court at Exeter. This principle was carried a step farther in 1701, when in the case of *Ree*

v. *Douse* (Lord Raymond's *Reports*, Vol. I, p. 672) *Douse* having been indicted under 1 Jac. I, c. 4, for having kept school without the bishop's license, it was held that the indictment was bad, as the act of James I only applied to grammar schools. Thus by the year 1701 all forms of education except grammar teaching were released from the control of both the ecclesiastical law and the statute law, which imposed licenses on schoolmasters, and thus brought all elementary education under the common law. The ecclesiastical control over grammar teaching was with great hesitation affirmed in the case of *King v. Hill* (*Modern Reports*, Vol. XII, p. 518) in 1701, and then came in 1702 the inconclusive case of *Matthews v. Burdett*, in which great efforts were made to establish the position that no schoolmasters at all were under the control of the Church. The common law had won the hard-fought battle with regard to the grade of education that mattered in 1702. The old principle had at last been affirmed, the principle laid down by Mr. Justice Hill in 1410: "to teach youth . . . is a virtuous and charitable thing to do, helpful to the people, for which he cannot be punished by our law." It is true that the grammar schools were still retained under the control of the ecclesiastical and statutory law. With regard to these schools the contest was not pressed after 1702. It was useless, as the act of James I clearly applied to them, if the ecclesiastical law did not. The old common law was definitely shut out from the grammar school and by the middle of the eighteenth century the grammar schools of England were empty. J. E. G. DE M.

**COMMON MASTER OF THE TOWN, THE.**—A phrase which connotes a very important stage in the change from the religious to the municipal control of education in English towns during the Middle Ages. The term occurs in the important *Gloucester Grammar School Case* (1410), reported in *Year Book*, 11 Henry IV (ed. 1679, p. 47, case 21). The case deals with the question of educational competition against the cathedral grammar school. The complaint was that a town school had been opened with the result that the cathedral school was compelled to bring down its fees from 40 pence to 12 pence a quarter. In the course of the argument Chief Justice William Thirning said: "If a man retain a master in his house to teach his children he damages the Common Master of the Town [common master del ville]. Yet I believe that he has no action." Clearly the common master held a well-recognized position in England in 1410, and this particular case is only one instance of the struggle and competition which must have gone on between the

schools attached to secular religious houses and cathedrals and the free grammar schools, which in many cases were municipal. But the subject requires much more investigation before our knowledge of pre-Reformation education is by any means perfect. J. E. G. DE M.

See COMMON LAW IN EDUCATION.

MONTMORENCY, J. E. G. DE. *State Intervention in English Education.* (Cambridge, 1902.)

**COMMONPLACE BOOK.**—A book in which passages on different topics are gathered under general heads for purposes of general reference and application. A commonplace, or *locus communis*, is defined by Cicero as a general argument which is applicable to many cases (*De Inv.* II, xiv-xvi, and Elyot, *Gouernour*, I, xiv). The practice of keeping notebooks into which commonplaces were written was customary among the medieval students. Rudolph Agricola (*q.v.*), in his letter *De Formando Studio* (1534), gives perhaps the best example of the method in which such books should be drawn up: "We should have certain topics, as for example, virtue, vice, life, death, ignorance, benevolence, hate, and others of this kind, the use of which is quite common on all occasions, and, as it were, general, and we should repeat these frequently and refer everything we say, so far as possible, and certainly everything we learn, to these headings." Agricola recommends this method as the best for retaining what has been learned. It will be noticed that most of the topics are of a moral character. The *Loci Communes* of Melancthon (1525) had a religious content. Erasmus recommends the taking of notes in class, not verbatim as dictated by the teacher, but under headings systematically arranged. The keeping of commonplace books usually accompanied the exercises in declamation (*q.v.*) and disputation (*q.v.*), the notebooks serving for ready reference on the theme under discussion. An excellent example of the commonplace book is that compiled by Milton and published by the Camden Society (*Publications*, Vol. XVI, 1876). The topics are divided into three parts, (1) *Index Ethicus*, (2) *Index Economicus*, (3) *Index Politicus*. Under (1) he deals with *malum morale, de viro bono, de morte, de curiositate, etc.*; under (2) with *de victu, de cultu, de liberis educandis, de servis, diritiæ, paupertas, etc.*; under (3) *respublica, amor in patriam, leges, rex, monarchia, tyrannus, de bello, de bello civili.* The commonplace book was naturally transferred to this country, and is early found at Harvard. Samuel Sewall (*q.v.*) defines commonplacing as "the reducing and treating of topics of theology, philosophy, etc., under certain commonplace or general heads" (*Diary*, 1674). Commonplacing as a part of the disputation is referred to as an exercise expected of all soph-

isters and bachelors (*Laws, Liberties, and Orders of Harvard College, 1642-1646*). The term seems to have been used both of the short sermon delivered by students at the opening of the day's work, and of the regular defending of a thesis at graduation. The commonplace book disappeared generally in the middle of the eighteenth century, although it appears to have been in use in the sixth form at Harrow as late as 1839. (See *American Annals of Education*, Vol. IX, 1839, p. 100.)

The commonplace book, or *Stammbuch*, not only served an educational purpose. In the eighteenth century in Germany the practice arose of keeping autograph albums, in which autographs were accompanied by quotations or original contributions of a literary character. The best German collection of this type of *Stammbuch* is located in the ducal library at Weimar.

Arising out of both these forms of practices is the publication of books of quotations and sayings on any one topic, taken from all languages. A good example will be found in the *Stammbuch des Lehrers* (Stuttgart, 1878).

**COMMON SCHOOL ASSISTANT.** — See JOURNALISM, EDUCATIONAL.

**COMMON SCHOOL EDUCATION.** — See JOURNALISM, EDUCATIONAL.

**COMMON SCHOOL FUND.** — See SCHOOL FUNDS.

**COMMON SCHOOL JOURNAL.** — See JOURNALISM, EDUCATIONAL.

**COMMON SCHOOLS.** — A somewhat general term, applied to such schools as are supported by general taxation and open to all, and in America practically synonymous with the term "public schools." As sometimes used only elementary or rural schools are meant, but strictly speaking it should include all of the schools provided by the taxation unit referred to. It is so used by the United States Commissioner of Education in the statistical tables referring to the different state systems. In rural districts the term means the "district school." In cities it includes kindergartens, elementary schools, high schools, city normal schools, evening schools, truant schools, vacation schools, and special type schools. When referring to the state it in reality includes the state university as well, though the term is not generally used in such a comprehensive manner. Ordinarily the term is applied to the elementary schools of a city only, the high schools being designated as high schools.

The common school system of the United States, so far as there can be said to be a general system, embraces the 12 years of school work given in the elementary schools (8 years) and the high school (4 years). In the cities

the kindergarten is added to the system at the lower end. These schools are intended for children from the age of 6 to the age of 18, and the kindergarten reaches down to 5 or 4 years of age, and in a few states it may reach down to 3 years. As a matter of fact, there is no uniform common school system throughout the country. Any city or town is at liberty to develop its school system in almost any manner that it desires and can afford, and the result is that one finds very limited city systems and very extensive city systems in the cities of the same state. Some cities have an elementary school course of nine years and some of seven years, instead of the eight which is the general rule. The high school, too, in a few places is a six-year high school, made so by including the seventh and eighth grades in the high school; while in other cities the five- or six-year high school course is made by adding what are often called graduate years to the high school, and thus extending the years of education provided. (See article on HIGH SCHOOL COURSES.) In many rural schools the elementary school covers nine years instead of eight. The different American school systems are alike in their nature and purpose, rather than in their extent and plan. E. P. C.

**COMMON SCHOOLS, SUPERINTENDENT OF.** — See SUPERINTENDENT OF SCHOOLS.

**COMMON SENSATION.** — Aristotle distinguishes the *sensus communis*, or common sense, from the particular sensations and senses. Motion, rest, form, magnitude, number, and unity are properties common to all objects, and hence could not be perceived by the particular sense organs. We must therefore possess a common sense by means of which we may perceive these common qualities or sensations. Later authors, as Sully, have used the term to designate the sensations that have not as yet been analyzed and for which no sense organs are known. Sensations from the inner organs, from the muscles, and from the skin have been put into this class. The number of qualities is constantly decreasing as new organs are recognized and new qualities analyzed from the complex of undifferentiated sensations. W. B. P.

**COMMONS.** — A term used as early as the fourteenth century for provisions or expenses on food laid out in common. From the practice of living in common at the universities the phrases "keep commons" and "put out of commons," for being in residence and being expelled, arose. At present the word is used to refer not to a whole day's ration, but (1) to the normal quality of any kind of food served from a college kitchen or buttery, and (2) frequently to the building where meals are served to students.

See UNIVERSITIES.

**COMMONWEALTH IN ENGLAND AND EDUCATION.**

— In most school histories it will be found to be assumed that during the Civil War and the Interregnum the school was in abeyance, or, if it is found going on, great surprise is expressed at the fact of what is regarded as exceptional favor to that place. As a matter of fact, the Commonwealth period is one of great activity and new developments in the educational world. The intellectual classes were on the Parliamentary side. The royal party had no names to put in competition with Selden and Prynne, Milton and Marvell. The schools and universities were a special object of the care of Parliament. While Laud drove schoolmasters who expressed ideas opposed to his into prison, like Gill of St. Paul's, or out of office, like Langley of Gloucester, under the Commonwealth, the schoolmasters who minded their own business and did not actually bear arms were left unmolested in their places. The cathedral grammar schools, which are usually supposed to have been the objects of Parliamentary attack or suppression, were specially cared for. Very soon after the war began, on Oct. 14, 1642, the estates of deans and chapters were ordered to be sequestered; but the order contained a proviso that "allowances assigned for scholars and other charitable uses" were not to be interrupted. A year later, the Parliamentary committee for plundered ministers was extended to schoolmasters, and as the order for sequestration of chapter estates gradually became effective, power was given to this committee to relieve poor schoolmasters as well as ministers thereout, while having power to remove scandalous schoolmasters. They acted with judicial fairness. At Canterbury articles brought against Ludd, the master of the cathedral grammar school, on Jan. 22, 1644, were referred to a local committee of members of Parliament and city councillors to examine. On Nov. 25, several members were added to hear Ludd and examine witnesses. On Apr. 4, 1646, his answer and the examinations were sent back to the committee to hear Mr. Ludd again, and eventually he remained and died in office in 1649. Though after Oxford was taken the colleges were naturally purged of those who had actually taken arms against Parliament or who refused to accept the regime, and two thirds of New College was thus removed; yet, as soon as the war was over, the regular succession of scholars from Winchester College was resumed and the vacant places were largely filled by old Wykehamists. When the Provost of Eton ran away to join the King, his place was supplied by one of the most eminent scholars who ever held the office, Francis Rous, afterwards speaker to one of Cromwell's parliaments. Westminster under Busby (*q.v.*) was taken under the special care of Parliament, and a new governing body created by act of Parlia-

ment for it. It is remarkable that the two earliest school lists extant are those of Winchester in 1652 and Westminster in 1653, and some of the most famous persons they produced were during that period, *e.g.* Bishop Ken at Winchester and Dryden at Westminster. It was at this time, in 1650, that at Winchester the well-known Latin poem descriptive of the school life, was produced. When deans and chapters were abolished by act of Parliament on Apr. 30, 1649, special provisions were made to prevent Westminster, Eton, and Winchester from suffering in revenue, and the spiritual property of the chapters was given to 13 trustees, and afterwards to a University Reform Committee, for augmentation of salaries of poor ministers and schoolmasters, while £2000 a year was assigned for the universities. Under this provision, the salaries of cathedral grammar schoolmasters of Chester, Chichester, Durham, Rochester, Salisbury, and St. Anthony's School, London, which last was paid from St. George's Church, Windsor, were increased and in many cases doubled; and other schools which were old grammar schools, confiscated by Edward VI and paid out of Crown revenues, received similar increases. The heads of most colleges in the universities got large augmentations. Thus the master of Pembroke Hall, Cambridge, received £70 a year, of Peterhouse £53, of St. John's and Clare, £100; while at Oxford, Wadham, Queen's, and Lincoln received £63, Brasenose, £90, and Balliol and University Colleges £93 a year. The lecturer in astronomy at Oxford was increased, first £50, and then to £80 a year. Immediately before and after the dissolution of chapters the county of Durham petitioned for the establishment of a university college there. But owing to the wars it was not till May 15, 1657, that it was founded by Letters Patent of Oliver Cromwell, with power to acquire lands up to £6000 a year. A provost and 12 fellows were appointed, 24 scholars, and 12 exhibitioners. Next year it petitioned for power to grant degrees. Oliver died, and before the opposition of Oxford and Cambridge was finally settled, the Restoration came and the endowments reverted to what Cranmer called "the fat and lazy prebendaries." It was nearly two centuries before Durham at last, in 1832, got its university from the same source, the suppressed prebends of the cathedral. Proposals were also made for a London university, but not carried out, and London, too, had to wait two centuries for its university.

Two districts especially benefited by the Commonwealth. "An act for the Propagation of the Gospel and the Maintenance of godly and able ministers and schoolmasters" was passed for Wales on Feb. 22, and for the four northern counties of England on Mar. 1, 1650. Several old schools had their endowments increased, while some 24 new schools were established in Wales. But again when the Restoration came, those schools ceased, and Wales had to wait

more than 200 years for its Intermediate Education Act, 1888, under which Carnarvon and other places at last received schools. In Durham County alone some 12 new schools were established, while a new departure, for which Charles II and Pepys afterwards got credit, in connection with Christ's Hospital, London, was taken, in the establishment of navigation schools at Sunderland and Nether Elworth. For some reasons unexplained, the county of Dorset, though not included in either of the Gospel Propagation acts, received special favors in the matter of schools, some half dozen being either increased or newly created.

But the most permanent result of the Commonwealth period was the immense impetus it gave to educational discussion in such persons as Samuel Hartlib, John Dury, and John Milton (*qq.v.*), and to actual experiments in education in the schools of John Milton, John Farnaby, and Charles Hoole (*qq.v.*), the first, as all the world knows, a Republican, the two latter royalists, and all in the city of London, while at Bury St. Edmunds, the dispossessed "malignant" master, Leeds, was allowed unhindered to set up a private school, which brought the grammar school to such low water that its governors were fain to have him back again. The liberty of unlicensed schoolmasters, gained by the abolition of the bishops and chapters, was quite as important as that of unlicensed printing. Even the courts of the Restoration were forced, to recognize the liberty that had been gained, in Bate's case, 1670, and Cox's case, 1671, and recognized that schools in arithmetic, writing, French, geography, and navigation were outside episcopal license. (See COMMON LAW IN ENGLISH EDUCATION.) So that a great step forward to modern subjects of teaching and free development was gained, though the new Commonwealth and Protectorate schools died with their creators. A. F. L.

**COMPARATIVE LITERATURE.** — See LITERATURE, COMPARATIVE.

**COMPARATIVE PSYCHOLOGY.** — See ANIMAL PSYCHOLOGY.

**COMPARISON.** — Similarity (resemblance, likeness) has been recognized since the time of Plato as a fundamental category of knowledge. Aristotle showed that it was one of the two principles of the sequence of ideas in memory and imaginative anticipations and constructions, contiguity being the other. (See ASSOCIATION.) Comparison is the process of rendering the place of resemblance explicit and

definite. Without comparison generalization (*q.v.*) is impossible, hence the practical importance of comparison in the training of intellect. It is, however, a mistake to suppose that the mind begins with a number of objects, standing, as it were, on a level in a row, and then, by comparison, extracts from them some common factor. This view, although prevalent in the pedagogical logic of method, omits two important considerations. In the first place, since any and every object is like any other object in some conceivable regard, intelligent comparison always implies specific end or purpose. We would not ordinarily compare an elephant and justice; a square and a rose, not because no points of similarity can be found, but because there is no purpose to be subserved by discovering such points. In teaching, with a view to leading pupils to form general ideas by comparing particular objects, this prerequisite of purpose to motivate the comparison is often overlooked; it is supposed that the mere purpose of getting a general idea is a sufficient motive for making comparisons. Thus the child is told to compare this and that and the other river, or flower, or whatever, so as to find out what they have in common. Under such conditions, confusion and bewilderment, blind groping or mechanical routine, are inevitable consequences. The pupil must have in mind some end with reference to which the objects are to be compared, — erosion, the principle of gravitation, navigability, supply of energy for manufacturers, or whatever.

This suggests the second point. The mind *begins* comparison on the basis of some vague anticipation of common factors; it does not wait for the comparison to terminate before the common factor emerges. Put psychologically, one object suggests some similarity or resemblance which forms the starting point. Comparison then works backward and forward between the two objects with a view to making the vague feeling of resemblance more precise, and more complete, and to ascertain the scope and the importance of the suggested resemblance with reference to understanding the particular matters at issue. The resemblance may turn out, when followed up, to be superficial and trivial, *e.g.* not to throw light upon the objects of study. Or it may turn out to be a key to grasping their significance. In any case, comparison is an act of clarifying and building out a vague and inchoate sense of resemblance, not a method of reaching the common factor in objects having prior to comparison no felt community with one another. J. D.

**COMPARISON AND ABSTRACTION.** — The "third step" in the method of the recitation or the procedure of the "inductive development lesson" (*e.g.* of Herbart). The transitional stage between the "presentation" of new facts and the induction of a generalization from them, the stage at which the points

of resemblance and differences are emphasized through "comparison," preparatory to the "abstraction" of the law, rule, or other generalization which is the product of the pupil's thinking.

See RECITATION, METHOD OF.

**COMPARISON, METHOD OF.** — One of the two special methods employed in teaching facts or forms where confusion exists or is likely to occur, as in the case of spelling in the use of such homonyms as "their" and "there." The method brings both of the confusing factors together, and, by comparison, distinguishes their form and usage. The other and supplementary method is that of "separation," where the form and use of each factor is developed separate from the other. The method of "separation" is most used in teaching young pupils new knowledge, in connection with which confusion has not yet arisen. The method of "comparison" has its more frequent use with old pupils with whom the confusion has already arisen. It is an important "corrective" method, as the method of "separation" is one of prevention. These two means of teaching have their largest utilization in the formal aspects of instruction, where errors of convention are likely to occur, as in spelling, grammar, etc.

See CORRECTION OF ERRORS. H.S.

**COMPETITION.** — See INTEREST; MORAL EDUCATION; REWARDS AND PUNISHMENTS; SCHOOL MANAGEMENT.

**COMPETITION, PSYCHOLOGY OF.** — It is a well-known fact that an individual is capable of exercising more energy under conditions of competition than he could exercise if he attempted to do work by himself. This increase of energy is due to the increase in stimulation which comes from the presence of others. Indeed, the nervous system of any one engaged in a piece of work is aroused to more energetic action by the mere presence of observers in such a way as to affect the intensity and rate of his work. Mosso showed in his experiments on fatigue that when a subject had reached the limits of his efforts on the ergograph (*q.v.*) the arrival of an interested observer would arouse him to renewed activity. The same general principle is illustrated by the pace-making which is practiced in various forms of racing. The highest speed of a bicycle rider is obtained under conditions which arouse him through competition. The best athletic records are made under conditions of social stimulation. The principle thus illustrated is of importance in educational discussions, because the work of the school is in large measure conducted under conditions of competition. How to regulate such competition in order to secure a maximum advantage without overexciting the individual or reducing his independence and personal initiative are matters which require the greatest attention on the part of teachers. In

general it should be said that no competition should be carried to the point where it becomes the chief aim of the student to excel his competitors. Consciousness of social rivalry should therefore be regarded as a danger signal, while, on the other hand, some consciousness of one's rivals is an entirely legitimate motive with which to arouse one's energies. C. H. J.

**COMPLEMENTARY COLOR.** — A color is complementary to another which gives, when mixed with it (see COLOR MIXING), in certain proportions, gray, if the result is of sufficient intensity, or white. In general any color of the spectrum between red and green is complementary to some color between green and violet. Green itself is not complementary to any color within the spectrum, but to purple, which is obtained by mixing, for instance, red and blue. Some such complementary pairs are red and blue-green, yellow and blue, yellow-green and violet, green and purple. R. P. A.

**COMPLEX NUMBERS.** — A term now used to apply to numbers of the form  $a + bi$ , where  $i$  stands for  $\sqrt{-1}$ . If  $a = 0$ , the complex number assumes the form  $bi$ , an *imaginary number*,  $i$  being the imaginary symbol. Neither name is particularly fortunate. The word "complex" is also used for various other purposes, as to designate a type of fraction in which the numerator, the denominator, or both numerator and denominator, are fractional. The word "imaginary" is misleading, since  $\sqrt{-1}$  is no more imaginary, for certain purposes, than are  $-1$  or even  $\frac{1}{2}$ . We cannot pick up a book  $\sqrt{-1}$  times, or  $-1$  time, or  $\frac{1}{2}$  time, and yet all of these symbols are perfectly real in certain other cases. Nevertheless the names have been inherited, and so long as their meaning is not taken literally, they serve the purposes as well as other names would.

The ancients recognized the difficulty involved in the square root of a negative number. Heron of Alexandria (*q.v.*) has a problem involving  $\sqrt{81 - 144}$ , and he, or his copyist, gets around the difficulty by taking  $\sqrt{144 - 81}$ . Diophantus (*q.v.*) has an equation in which the roots are imaginary, but says that it cannot be solved. Bhaskara (*q.v.*), the Hindu (c. 1150), states in his algebra that "there is no square root of a negative number." Cardan

(*q.v.*) calls these numbers sophistic (1545). The terms "real" and "imaginary" were first applied to the roots of an equation by Descartes (*q.v.*) in 1637.

A number of efforts were made by writers between 1650 and 1800 to make the subject more real, notably by Wallis (1685), De Moivre (1730), Euler (1748), and Kühn (1750). De Moivre developed the important formula  $(\cos x + i \sin x)^n = \cos nx + i \sin nx$ , and Euler the remarkable consequence that  $\cos x + i \sin x = e^{ix}$ , from which it at once follows, by letting  $x = \pi$ , that  $-1 = e^{i\pi}$ . The most important step taken in the direction of making the imaginary seem as real as other artificial numbers was taken by Caspar Wessel (1745-1818), a Norwegian by birth and a Dane by adoption. He presented his famous memoir, *On the analytic representation of direction*, at Copenhagen, in 1797. In this he sets forth the modern graphic representation of the complex number, essentially as it is given to-day in algebra. Various other writers, ignorant of this memoir, soon entered the same field. Of these the greatest was Gauss, who, in 1831, set forth the theory in somewhat the same manner as Wessel.

Briefly stated, the graphic representation is as follows:  $XX'$  represents the axis of real numbers,  $OX$  being = positive and  $OX'$  being negative.  $YY'$  represents the axis of imaginaries,  $OY$  being positive and  $OY'$  being negative. The symbols  $+$ ,  $-$ ,  $i$ , and  $-i$  are

considered as symbols of direction,  $+a$  being  $a$  to the right of  $O$ ,  $-a$  being  $a$  to the left,  $ia$  being  $a$  up from  $O$ , and  $-ia$  being  $a$  down from  $O$ . Just as the sum of  $+4$  and  $-3$  make a number whose absolute value (value independent of direction) is less than 4 or 3, so  $x + yi$  represents a number whose absolute value is not the sum of the absolute values of  $x$  and  $y$ . This sum is represented by the line  $OP$ , or  $r$ . This complex number may be represented analytically in several ways, as  $x + yi$ ,  $r(\cos \phi + i \sin \phi)$ , or  $re^{i\phi}$ . Sometimes one form is the more convenient, and sometimes another.

Complex numbers are subject to the ordinary laws of operations, being added, subtracted, multiplied, and divided somewhat as other numbers are. These various operations are easily represented graphically.

The subject has recently attracted the attention of teachers of elementary algebra,

because of the fact that the complex number appears in the study of quadratics. It is entirely feasible to give a brief explanation of these numbers to a class in the high school, although any clear understanding of the general theory of the graphic representation on the part of the pupils is not to be expected. Many algebras at present give such a brief introduction to the theory. D. E. S.

**COMPLICATION.** — Whenever a memory image is so intimately related to a present experience that the mind is unable to discriminate between those elements of experience which are now presented to the senses and those which are drawn out of memory, a complication is said to arise. An example of such complication is seen in the experiences derived from words where the sound or the visual sensations which arouse the experience of the word cannot be distinguished by the listener or reader from the interpretations which he immediately adds to the sounds or the visual image. Another illustration is to be found in the example of the person who sees a white object in the dusk and mistakes it for a ghost. He does not distinguish between his visual sensation and the interpretation which comes from his excited experience. It is important that teachers recognize the fact that most experiences are complications, so that they may realize the difficulties which the pupils have in arriving at a full understanding of what is in the teacher's mind when teacher and child have the same sensory material, but totally different memory images acting upon this material. C. H. J.

 STOUT, G. F. *Manual of Psychology*. (New York, 1899.)

**COMPOSITE NUMBERS.** — See NUMBERS.

**COMPOSITION.** — The "putting together" of lines, masses, and colors to create a harmony. See ART IN THE SCHOOLS; ART, METHOD OF TEACHING; DESIGN; etc.

**COMPOSITION.** — The term "composition" is applied to the grouping of figures or other objects in painting and sculpture, and to the grouping of ideas in language. In each case the end sought by such grouping is the attainment of certain general effects in the whole work. It is of the grouping of ideas expressed in words that this article treats.

Though the terms "rhetoric" and "composition" are frequently found together, and sometimes confused, they properly designate two quite distinct phases of the subject. Rhetoric is concerned with the theoretical side, with the laws of expression. The term "composition" means (1) the application of those laws, consciously or unconsciously, in spoken or written discourse, or (2) the discourse itself. A treatise

on rhetoric is a systematic presentation of the laws of discourse, generally illustrated by specimens of such discourse. Composition is therefore an art, as distinguished from a science. It is, moreover, an art that is in constant employment by all normal people, either in its spoken or written form; though the difference is very great in the skill with which the art is practiced by different people.

The four fundamental processes of composition are distinguished by the ends they have in view: narration, which aims at telling a story, or a succession of incidents; description, which aims to describe or portray, and which most commonly makes its appeal to the visual imagination; exposition, whose purpose is to explain; and argument, whose purpose is to prove some proposition. While the distinctions among these forms are often convenient in instruction, it must be remembered that the various forms are seldom found entirely distinct. Narration and description are often found in the same composition. Moreover, the methods of the two are often so closely alike that it is difficult to say of certain passages to which of the two processes they belong. Exposition and argument are often found together, though the line between them is easy to draw. But exposition and description again often overlap each other. The full treatment of them belongs to the theory of rhetoric rather than to the art of composition, and finds no place either in the modern textbook of composition or in the work of the teacher. Of these four processes exposition is by far the most common both in written and in spoken language; narration comes next in order of frequency. Except in literary works, descriptions are usually limited to a few words. Except in formal presentations of propositions in law, science, or the like, arguments seldom proceed beyond a few sentences.

Composition looks rather to the end to be attained, *i.e.* the effect to be produced, than to the employment or the practice of any one of these type forms of writing, though the laws of each must often be consciously used by the writer. In scientific exposition or in serious argument, however, it is necessary to adhere more closely to the type.

**The Teaching of Composition.** — Within the past twenty-five years the art of composition has assumed far greater importance than before. So long as the ideals of classical study ruled the schools, and culture was thought to come principally from a knowledge of Greek and Latin, expression in English was neglected by teachers. With the breaking away from the classical tradition, and the increased recognition of the educational value in the study of modern life and environment, the minds of teachers turned more and more toward instruction in the mother tongue. The beginnings of the movement go back, indeed, to the days of Franklin and Jefferson. But the

general movement even in some of the more backward schools cannot be said to have become established before 1885. It is now usual to find composition given a large share of the time of the program, and taught as a vital subject rather than in the occasional and perfunctory fashion of former days. It is now recognized as a subject of the greatest utility, inasmuch as every one depends for his pleasure and success in part upon his ability to express his ideas agreeably and effectively. It conduces to clearness and definiteness in one's thoughts, to care in ordering and expressing them. To have tried conscientiously to say things well helps in the appreciation of things well said, and therefore adds to the enjoyment of literature. And command of one's native speech puts one into closer touch with the social and national life about him. Such are the principal arguments by which the present important place of composition is defended.

Especially noteworthy are the changes in the methods of instruction. Theory has given place to practice; it is fully realized that one can learn to speak and write only by speaking and writing under stimulus and guidance. Rhetorical rules are worth nothing except as applied. The earlier teaching aimed at a sort of lifeless accuracy. Verbal and grammatical correctness, propriety in spelling and punctuation were sufficient. The present-day teaching of the better sort judges the child's efforts not only for these things, but for the interest and general effectiveness of the whole composition. Has he done with the subject what he should have been expected to do? Does his composition show that he has remembered and thought; that he has ordered and arranged? Such is the standard now set up, adapted though it must be to the child's age and capacity. In accordance with these standards the training is not in the lesser units of words and sentences so much as in paragraphs and whole compositions.

Through the influence of modern linguistic scholarship another influence is slowly working its way into the schools. Under the older (and erroneous) conception of language as a fixed and absolute thing, teachers often set up a rigid standard of grammatical and rhetorical propriety that could not be justified either from literature or from the speech of a large body of educated people. This standard, under which most teachers of the present day were educated, is slowly giving way before the conviction that a considerable latitude must be allowed in the choice of words and expressions; the conviction that it is often impossible to say, as between two expressions, that one is right and the other is wrong.

More and more the tendency is to have the pupil write of the familiar and concrete, of the things within his own daily experience, instead of the abstract and remote. It is realized that he can learn to write and speak best when

dealing with simple and familiar things. Such material commonly includes also his school work in other subjects than English. Themes drawn from his readings in literature may well be included, but must be chosen with careful reference to the limitations of children's minds.

Composition is recognized as a difficult art, involving, as it does, not only the expression of ideas, but the gathering and arrangement of them. So far as possible these two tasks should be divided. When the subject is chosen, it should be worked over and discussed in various lights, until the pupils can talk of it with some degree of freedom. The writing should be begun only after the pupils have gained some confidence in their ability to talk of the subject, and, in the later years, are able to outline it with a fair degree of clearness. Outlines made by the pupils themselves are an aid to both confidence and clear thinking.

In the elementary school the work in composition may be easily carried into other school studies, inasmuch as they are usually all taught by the same teacher. In the high school, however, the divorce between English composition and other subjects is an evidence that our systems are still imperfect. As long as the pupil speaks and writes carelessly in other departments, so long will the work of the English teacher fail to form good habits. Not until all teachers cooperate can we hope for the best results attainable.

As to the time of beginning the training in composition, and as to the amount to be required, there is still considerable divergence both in theory and practice. In some schools no work in formal written composition is done earlier than the third year; in others the pupils write simple reproductions of short and simple stories in the first year. It is as yet unproved which is the better plan. But there is general agreement that in these early years all the composition work should be as easy and spontaneous as possible. It is to be remembered that the oral work done even in these first years is also composition. As to the question of how much writing should be employed there are again differences of opinion. In general, however, it is agreed (1) that short exercises are better than long, for the long ones tend to produce either discouragement or prolixity; (2) that some writing should be done every day, the subject often being drawn from some of the school studies; and (3) that, if consistent with the foregoing rule, the pupils should not write more than the teacher has time to read.

This leads naturally to the question of criticizing the pupils' efforts in expression. The oral work should be carefully watched. Errors and carelessness alike should be corrected, generally when made, except when such interruption interferes with the pupil's thinking. The criticism of the written work is the only means of insuring its effectiveness. A few general principles, now commonly accepted,

may be stated. Pupils are to be made as much as possible self-critical and self-helpful, though care must be taken not to develop their self-criticism to the point of inhibition. They must be held responsible for things once learned. Generally the written work, after the teacher has corrected it, should be returned to them, be worked over by them, and again submitted for inspection; for if the criticisms made are not applied, they are useless. Work obviously careless in form and matter should not be accepted, if the teacher would have the pupil's respect and value the subject. But the criticism must not stop with these more mechanical matters. The work must be judged for its ideas. And, speaking relatively, the pupil must be led gradually to value his and other work for the ideas he has got into it, as well as for the clearness and effectiveness with which the ideas are conveyed. For this there is no better means than reading the compositions aloud, having the class as a whole help in passing judgment upon each other's performances. In all the work of criticism the teacher's true function is not that of the fault finder, but of the stimulating and helpful guide. If freedom and accuracy are to be attained, there must be a certain amount of drill. Frequent practice in dictation will help in giving control and facility over the forms of words and sentences. Of considerable value also is practice in saying the same thing in different ways. In brief, the work will be effective in proportion to the teacher's skill and resourcefulness.

Most of the general principles that apply to the work in the elementary school apply also *mutatis mutandis* to the high school. As has been said above, the high schools, like the elementary, have given prominence to the work in composition in recent years. This is due in part to the demands of the colleges that their students must, at entrance, give evidence of a good course in English, and in a greater degree to the belief, on the part of the high school teachers themselves, in the value of such instruction. It is especially to be noted that those high school courses which are not directly preparatory to college commonly give more time to instruction in English than is contained in the college preparatory courses. For a considerable period the desire to unify the course in English, and especially the literature and composition, led to forced relations that were not to the advantage of either. Pupils were required to write too frequently on literary subjects that were beyond their grasp, with the result that the compositions were insincere and futile, and the pupil's love of literature hindered rather than helped. At the last meeting of the National Conference on college entrance requirements in English (1909), in which both college and high schools were fully represented, a report was adopted which, it is hoped, will tend to put the composition work on a sounder

basis. One of its most important recommendations was that a considerable part of the composition writing should be upon such experiences as come within the pupil's daily life and observation. That the report was in harmony with the judgment of the best teachers appeared from the way in which it was received.

**COMPOUND NUMBERS.** — This is a term that has long been used in arithmetic to denote numbers in which several different denominations enter, as in the case of 3 ft. 7 in., or 2 hr. 3 min. 48 sec. Such numbers arose from the necessity among the ancients of avoiding fractions (*q.v.*), which were the stumbling block of all antiquity. Instead of writing 2½ ft., the person unfamiliar with fractions could write 2 ft. 9 in., and so for similar cases. (See MEASURES.) The same effort is seen in the use, by scientists, of the sexagesimal fraction. (See FRACTIONS.) With the rise of the Arabic notation (see NOTATION) in Europe, from the thirteenth to the fifteenth centuries, the writing of fractions became more simple, and with the invention of the decimal fraction the use of compound numbers becomes less imperative. For the last 300 years, therefore, these forms have gradually lost their standing. The adoption of the metric system in the nineteenth century, in a large part of the civilized world, rendered practically obsolete a considerable part of the work in compound numbers. Therefore, at the present time in America, we have only feet and inches as the universal example of a compound number. We rarely hear any more of gallons and quarts together, or of yards and feet, or of miles and rods, or even of pounds and ounces. Meat, for example, is bought by the pound, half pound, and quarter pound, and not by the pound and ounce, and similarly for other commodities. As a result of this tendency the teaching of compound numbers is at present less formidable than it was in the nineteenth century. With the exceptions of expressions involving time, numbers involving more than two denominations are practically eliminated. The four

fundamental operations are therefore reduced chiefly to numbers involving feet and inches, time, and enough other denominations to give some practice in the use of the tables.

D. E. S.

**COMPOUND TONE.** — Whenever two rates of sound vibration strike the tympanic membrane at the same time, there results a compound sensation. In the physical world there is a compounding of the air vibrations affecting each particle of air which is set in vibration. In certain cases, described under difference tones and summation tones, compound sensations are produced which have no parallel in the physical world of air vibrations. The special character of a compound stimulation in the sphere of hearing is due to the fact that all compound tones and all compound effects of any type are analyzed in the inner ear, and nervous currents are sent to the central nervous system corresponding to the various elements of the compound. The ear as an analyzing organ thus restores in conscious experience the complexity of external vibrations which were for the moment fused in a single vibration of the tympanic membrane and the outer organ of the ear.

**COMPULSORY ATTENDANCE.** — See ATTENDANCE, COMPULSORY.

**COMPULSORY EDUCATION.** — See ATTENDANCE, COMPULSORY.

**COMPULSORY SUPERVISION OF EDUCATION.** — See SUPERVISION OF TEACHING.

**COMPUTE.** — From the Latin *computare*, to reckon, from *com-*, together, and *putare*, to think, reckon, or count. In elementary teaching the word is used as a synonym of "calculate" (*q.v.*) or "reckon." In the Middle Ages it was used with particular reference to the computation of the calendar.

See CALENDAR; COMPUTUS.

**COMPUTUS.** — A term used in the Middle Ages to designate that portion of arithmetic relating to the calendar (*q.v.*), a subject that played the same important part in the ceremonies of the Christian Church as in earlier religious worship. The subject was known by various names, such as *computus paschalis* and *computus*

*ecclesiasticus*, but was commonly called simply *computus* or *computos*. The latter spelling was at one time the more common, as in the following definition from an anonymous manuscript of the fourteenth century: *Computos est scientia numerationis et divisionis temporum*. It was entirely in accord with tradition that the work of regulating time should have been in the hands of the priests, since they had assumed this duty from the remotest antiquity. It was a relic of the days of sun worship, equinoctial festivals, orientation of temples, and of the various forms of celestial mysticism that finally developed into the science of astrology. The annual nail in the Roman temples, the sun-dial on the church wall, the indication of the hour by the tolling of the bell, and finally the clock in the belfry are all evidences of this tendency. The problem of the Christian Church was particularly complicated because it was found advisable for it to adopt so many customs which its converts were loath to sacrifice. The greatest of all the problems of the *computisti* was to fix Easter Day. It appears first in a noteworthy way in a work by Victorius of Aquitania (457 A.D.), and a century later it appears in a *Computus Paschalis* (562 A.D.), possibly by Cassiodorus. In 664 A.D. the question became so complex as to cause a serious conflict between the English and Roman ecclesiastics. The best of the early works on the subject was written by Beda, the venerable Bede (*q.v.*), in the eighth century, under the title *De temporum ratione*. A century later Rabanus Maurus, *primus praeceptor Germaniae*, wrote upon it, and so important did Alcuin and Charlemagne consider it that the former wrote upon it and the latter prescribed it as a study for every monastery. In the universities of the thirteenth and fourteenth century lectures were commonly held upon the subject, and the learned Sacrobosco (*q.v.*) wrote a *Libellus de anni ratione, seu ut vocatur vulgo computus ecclesiasticus* for the use of students. The first printed *computus* is that of Anianus (1488). The subject naturally found place both in the early printed arithmetics and in the church manuals. Thus Köbel in his *Rechenbuch* of 1531 devotes ten pages to it, and this custom explains the presence of the discussion of the Julian and Gregorian calendar in the American arithmetics of the nineteenth century. A good idea of the medieval *computus* may be obtained to-day from the Prayer Book of the Church of England or the American Episcopal Church.

We have certain relics of the *computus* in common use at present, as when we speak of "a red-letter day," and when we repeat the rhyme beginning, "Thirty days hath September." This rhyme, first found in print in English in 1590, appears in Anianus in Latin, but goes back at least as far as Sacrobosco, in whose *computus* it appears as *Sept. No. Iun. Ap. triginta dato, reliquis magis uno. Ni sit Bisextus, Februus minor esto duobus*. The word

"*computus*" was also used to mean an account, as in a document of 1316, beginning "Computus of Robert Oldman, reeve of Cuxham, from the morrow of St. James, in the 10th year of the reign of King Edward." D. E. S.

**COMTE, AUGUSTE** (1798-1857). — French philosopher; born at Montpellier in 1798 and died at Paris in 1857. He was educated at the Polytechnic School at Paris. About 1820 he became the pupil and disciple of Saint-Simon, who, observing the aptitude of his mind, intrusted to him the preparation of a Positive Politic, which, however, proved unsatisfactory, but evidently influenced the young philosopher, for, in 1826, he began a course of lectures, soon discontinued on account of a cerebral derangement, but resumed in 1828, in which the germs of his own system are already apparent. From 1832 to 1852 he was tutor of mathematics and examiner at the Polytechnic School, where he lived the quiet and uneventful life of a teacher and writer. The chief works produced during this period are the *Cours de Philosophie positive*, 1839-1842; the *Système de Politique positive*, 1851-1854; and his *Catechisme positive*, 1853. In his philosophy the two chief points are: (I) His idea of the evolution of human knowledge. He maintained that there are three stages in the intellectual development of the race, and, so far as these stages represent typical forms of knowledge, in the individual; namely, the *theological* stage, in which man refers phenomena to the immediate action of some supernatural being; second, the *metaphysical* stage, in which abstract forces or essences are used as explanatory agencies; and third, the *positive* stage, which refers all phenomena to the operation of general laws, observed in the immediate behavior of the phenomena themselves. This idea led him to a particular classification of the sciences, upon which, he maintained, the education of the people must henceforth proceed. This hierarchy he arranged as follows: (1) The sciences of number (arithmetic, algebra, geometry, and mechanics); (2) astronomy; (3) physics and chemistry; (4) biology and physiology; (5) social physics or "sociology." He further maintained that in this classification each science depends on the truths of all the sciences which precede it, plus such truths as properly belong to it. Thus sociology includes all the preceding sciences and adds new data to them. Moreover, each group passes through the three stages of the evolution of knowledge; but inasmuch as the theological and metaphysical stages are now practically at an end, the final, or positive, stage, which synthesizes and coordinates all knowledge for the good of humanity, is the only one that will survive in the future. (II) The second part of his philosophy is the direct outcome of this conclusion; for Comte's political and sociological doctrine connects directly with the positivistic stage now emerging. The first to coin the word "soci-

ology" to include the whole of the positive doctrine of philosophy, he regarded society as an organism, with humanity as the main object of study; social law excluding any real freedom of the individual. As regards education, he taught that the hope of further progress lay in the economic and civil enlightenment of the great units of the social organism, the family, the State, and the "Church." And for this purpose, of course, science must be the chief means of culture. Comte, however, only gave himself incidentally to the study of educational theory and practice, his promise, made in the *Cours de Philosophie positive*, of a special treatise on pedagogy never being fulfilled; but the chief points of his system may serve as a clue to the scattered suggestions found in his works. Thus he maintained that (1) The education of the individual must be based on the idea of the "stages" of knowledge and be adapted to the civilization reached in the modern, or positivistic period. (2) Mathematics, accordingly, form the chief point of departure in the process. Concrete and physical studies are not first in his view. (3) Education must be universal, and no discrimination should be made between rich and poor in this respect; but the training of the school must be adapted to the needs of the units, while maintaining the integrity of the system, which, he said, is "constantly similar and identical." All questions of method must be determined according to science, *i.e.* they must be positive, for it is only along this line that the expectation of fuller knowledge and greater social efficiency can be fulfilled.

**CONÆSTHESIA.**—In certain individuals the stimulation of an organ of sense arouses experiences appropriate to some other sense. Thus such an individual on hearing a high, shrill tone sees the color red. This is not a mere association of memory images, but a joint action of sensory centers, probably due to some central connections.

**CONATION.**—See **VOLITION**.

**CONCENTRATION.**—The grouping of the work of the school around some central subject. Everything is studied as a phase of this subject, or as contributing to its better comprehension. The core subject may be one of the ordinary studies of the curriculum, or it may be some more universal one, selected because it seems adapted to the task of unification better than

any special subject. Concentration may fairly well be characterized as the extreme type of correlation (*q.v.*). Subjects are made to support each other by being reduced to phases of one large subject. This method of organizing the course of study undoubtedly favors the highest degree of unity. It proceeds essentially upon the principle that there is an unitary aim of education which is best realized through some fundamental study, and that, in order to contribute to the aim, all other subjects should be subordinated to this.

In general four types of concentration may be distinguished on the basis of the subject chosen as the core of the curriculum:

(1) *Concentration about history* is the scheme of Ziller (*q.v.*), a follower of Herbart (*q.v.*). It is based on the idea that the aim of education is the development of character. Now, although ethics seems to be the subject contributing most directly to human character, it is evident that, if it is to prove educative, it must be given content by being related to a body of concrete knowledge, and made interesting and potent with the will. This result is accomplished through history, which may be defined as the study of concrete ethics, or ethics in action. The selection of history as the core subject enabled Ziller to arrange the course of study according to the plan of culture epochs (*q.v.*). Literature, art, and even science were studied according to the principle of historical development. This method is especially difficult of application to science, for it involves the study of abandoned scientific ideas before we take up those of the present, and, moreover, renders it exceedingly difficult to give either a reasonably complete or practically useful view of any science. The latter difficulty seems, even when the culture epoch theory is not employed, inherent in any plan of concentration that uses the humanistic studies as a center.

(2) *Concentration about universal science*. The modern reduction of the humanistic studies to a rationalistic or scientific basis enabled the development of the conception of a universal science dealing with the logically progressive exposition of universal law. Such encyclopedic schemes as those of Comte and Spencer (*qq.v.*) are the outcome of this idea. They find expression in the scheme of concentration about what may be called universal science, of which each subject, when properly studied, constitutes an integral part. Here we have the notion so elaborately developed by Colonel Parker (*q.v.*). He regards the aim of education as comprehensive intelligence, insight. His plan has been criticized as laying too much stress upon the scientific as contrasted with social, ethical, and artistic interests, and as considering rather the logical than the psychological order in the arrangement of the material of instruction. It is interesting to note that Colonel Parker emphasized especially geography, as embodying the principles at the development of which he was aiming.

(3) *Concentration about geography and economic subjects.* The Herbartians in the United States have been prone to emphasize geography as, perhaps, the best center for concentration. When defined as the study of the earth in its relation to human life, it becomes a connecting link between the humanities and science. Professor De Garmo especially has developed a scheme, which he calls one of coordination. He would have three centers of concentration in the curriculum, language and the humanities, mathematics and the sciences, and a third group, which he calls the economic core. This deals with the subjects which bear on the methods by which man accomplishes his aims in the world of nature and society. The elementary phase of the economic subjects appears in geography. It is evident that this group constitutes the natural outcome of the other two, and so may be regarded as the core of the whole curriculum. In this event the scheme is in the last analysis one of concentration about those studies that make for the educational aim of practical efficiency.

(4) *Concentration about the social life of the school.* It is evident that while Ziller's scheme erred in making inadequate provision for science, Colonel Parker's plan tends rather to the other extreme of rationalism, neglecting somewhat the æsthetic, moral, and religious, as well as the historical. The plan of making the school work center about a school society, which was advocated by Professor Dewey, restores these factors to a leading place. Such a society can, he thinks, be made fairly representative of life. Hence the various special subjects will rise naturally out of a deeper study of its problems. Thus we have, not this or that phase of life, but life itself, as the central subject of the curriculum. The school society cannot, of course, be very complex for the little child. But as the pupils grow older their group activity can evolve until it approximates to the typical social life of today. Two methods governing the development of this society may be employed. It may represent in its successive phases the culture epochs of civilization, or it may begin with reproducing and studying the life of the neighborhood, and gradually enlarge its sphere until the typical social activities of the world have been covered. As the scheme of Ziller aims at moral character, that of Colonel Parker at comprehensive insight, and that of De Garmo at practical efficiency, so that of Dewey may be said to aim at social efficiency. E. N. H.

**CONCENTRATION, PSYCHOLOGICAL.**

—Mental activity is most effective when it is

limited to a narrow range of application, hence concentration of attention leads to great vividness and usually to clearness and distinctness of experience. Diffusion of attention is the opposite, and is closely related to distraction.

See ATTENTION.

**CONCENTRIC CIRCLE METHOD.**—A

special method of arranging a course of study in a school subject, or a special method of teaching a subject or topic. It involves the idea of treating the field a number of times, each successive treatment involving a more extended knowledge. In practice, it is quite similar to the "spiral" method of procedure, though theoretically the "spiral" method involves a continuity in the treatment of the subject or topic, which the "concentric circle" method does not imply. Both methods, however, involve the idea that subsequent treatments of the field will have an enlarged scope. Both methods are opposed to the older "logical" method which attempted to teach a topic through one treatment, more or less thorough and final. These methods have been used and discussed largely in connection with the teaching of arithmetic. They have appeared in other subjects, however.

H. S.

See ARITHMETIC, TEACHING OF; SPIRAL METHOD.

**CONCEPTION.**—A term describing a general principle or class as grasped by the mind. "Conception" is generally used of the act or operation of grasping the general or universal, while "concept" is used for the product of the operation. No point has been more disputed in logic and philosophy than the true nature of the general. In the Middle Ages it was long the chief battleground of metaphysical and theological controversy, the extreme and Platonic school, called realists contending for the superior and prior reality of the universal in respect to the individual; while the nominalists held that individual things are alone truly real, and that generality is found only in the words which are applied to a multiplicity of particulars. Between these two schools stood the doctrine of moderate realism, which was finally the official victor. It held that while universals have no separate existence, things are characterized by common properties and relations, so that universals exist in things, and, indeed, confer that intelligible character upon things which makes them susceptible of definition, classification, and demonstrative knowledge. At a later time, conceptualism was offered as a compromise doctrine; things are all particular and separate, but the mind, on the basis of their resemblances, forms an abstract idea of what they have in common, so that ideas, not things, not words, are the true generals. While this doctrine has doubtless been the most current of all the views in the last few centuries, it is probably the least satisfactory of any. It involves an evasion

of the question at issue, for while proclaiming that generality attaches only to ideas, it holds that the general idea is itself based on the resemblances or common factors of objects. This is either the doctrine of moderate realism in another form, or else it renders science impossible by denying the existence of relations among objects and making resemblance a purely subjective feeling. Moreover, since Berkeley, it has been generally doubted whether an idea is, as an existence, any more general than any other occurrence. In recent years the debate has shifted in part to the question of the nature of law, and uniform relations among objects, and in part to the question of the nature of meaning (*q.v.*). The educational aspects of the question are discussed under the latter caption, to which the reader is accordingly referred. Psychologically, the present tendency is to seek for the general in attitudes and functions rather than in existences whether of a metaphysically, physical, or psychical type.

J. D.

**CONCEPTION COLLEGE, CONCEPTION, MO.** — See **BENEDICTINES, EDUCATIONAL ACTIVITY OF.**

**CONCERT RECITATION.** — An oral exercise or drill in which the pupils respond in unison. Previously it was much used to develop pronunciation in the reading period, to master the addition, multiplication, or other tables in arithmetic, to memorize literary selections, etc. The use of concert recitation or oral class drill is decreasing. Other methods of memorization are supplementing the oral; and more individual and less mechanical means are supplanting the formal, vocal responses. Its most efficient use is at present found in the teaching of music.

H. S.

See **MEMORIZATION; RECITATION, METHODS OF.**

**CONCORD, THE SCHOOL OF PHILOSOPHY AND LITERATURE.** — This unique and in many respects typically American educational effort was foreshadowed in a scheme described by Emerson in his letter to Margaret Fuller, dated Aug. 16, 1840. He wrote: "Alcott and I projected the other day a whole university out of our straws," to be located in some country town, — Concord, Mass., being one of those suggested. After listing men and the topics which they should teach, he seems convinced that "we might make a puissant faculty and front the world without charter, diploma, corporation, or steward." Thirty-nine years later, the Concord School of Philosophy and Literature became a fact. The aim of the school, promoted by A. B. Alcott, F. B. Sanborn, R. W. Emerson, W. T. Harris, H. K. Jones, and others, was to advance and diffuse philosophical and literary culture by means of conferences and conversations. As its organizers more fully stated, it designed "to bring

together a few of those persons who, in America, have pursued or desire to pursue the paths of speculative philosophy, to encourage these students and professors to communicate with each other what they have learned and meditated, and to illustrate, by a constant reference to poetry and the higher literature, those ideas which philosophy presents."

The first session of the school was opened in Alcott's study at the "Orchard House," and continued six weeks during the months of July and August, 1879. Later the "Hillside Chapel" was constructed near by, and afforded more convenient accommodations. Later sessions were at first five weeks, then four weeks, and after 1883 two weeks only. The tenth and last session, in 1888, lasted one day only, and was a service memorial to Alcott. Representatives from 22 states of the Union were among the 400 attendants at the first session, one fourth of whom were residents of Concord. The type of students for whom provision was made is indicated in part by this statement appearing in the circulars: "No preliminary examinations are required, and no limitations of age, sex, or residence in Concord will be prescribed; but it is recommended that persons under eighteen years should not present themselves as students."

The programs of the sessions comprised courses of lectures as well as many single lectures by well-known scholars. During the first five years rather extended programs bearing on philosophy and literature were carried out. The sixth year was devoted mainly to the genius and character of Emerson (1882), the seventh year to Goethe's genius and work, the eighth year to Dante and Plato, and the ninth year to the philosophy of Aristotle and its bearing on modern thought. Among other themes treated were speculative philosophy, history of philosophy, the philosophical systems of Kant, Fichte, Schelling, and Hegel, pantheism, psychology, political philosophy, Greek life, literature, and religion, and aesthetics and art. In addition to the organizers of the school already mentioned, the following leaders, among others, in American thought and scholarship, contributed to its several sessions: John Albee, John Baseom, Mrs. E. D. Cheney, Thomas Davidson, John Fiske, Julia Ward Howe, G. H. Howison, William James, J. S. Kedney, James McCosh, E. Mulford, G. S. Morris, Benjamin Peiree, Noah Porter, D. J. Snider, and John Watson.

There was no "school of thought" developed out of these courses and single lectures, conferences and conversations. Each mind was perfectly free to present and to receive the truth according to its own conviction. But the school was more than a local incident. Springing from the midst of the New England Transcendentalism (*q.v.*), and welcoming the newly developed study of the history of philosophy by Americans, its outcome tended to move in

a certain direction. It attempted to analyze the essential ideals that should serve the newer life of the west. "In order to know what to teach and what to receive we must seek through philosophy the one central principle on which the world — the universe — rests. Then we have to trace this back again from that, through all its manifestations in religion, government, literature, art, science, and manners. . . . At a time when Germany is overpowered by the influence of Mill, Spencer, and Darwin, and this genius of materialism is getting so strong a hold everywhere, it is interesting to find that the Concord School reasserts with breadth and penetration the supremacy of mind. . . . But it must not be supposed that the School is hostile to science; on the contrary it approves and heartily sympathizes with it in its great work, which, properly regarded, it considers tributary to the highest ends of existence." (*Harper's Weekly*, Aug. 19, 1882, p. 516.) Many of the lectures were published in the *Journal of Speculative Philosophy*, and elsewhere, and Griggs' series of Philosophical Classics may be regarded as a product of the association of its respective authors at the school. Some publications by the school are mentioned in the literature below.

The positive service performed to the country by these active and thoughtful scholars coming together in this unique manner should not be overlooked. An informal organization, disconnected with any institution, and born largely out of the interests of the individuals concerned, it was an interesting experiment at a summer school before the latter was regarded as a possible, not to say a necessary, addition to our colleges and universities. It also served a widening educational purpose before the approaching organization of the graduate schools of philosophy in a number of universities in the decade following its close. It was also a forerunner of that movement which later issued in the formation of the American Psychological Association and the American Philosophical Association and similar societies which continue its general function of bringing leaders together for discussion.

**CONCORDIA COLLEGE.** — The name of a number of institutions of the Evangelical Lutheran Synods, located at Conover, N.C., Fort Wayne, Ind., Milwaukee, Wis., Moorhead and St. Paul, Minn. These institutions give a six-year course of study modeled after the German gymnasium, but none of them are parallel or equivalent to the public high school plus a collegiate course. The courses are preparatory to Lutheran Theological Colleges.

**CONCRETE AND ABSTRACT.** — Since the time of Pestalozzi, educators have been familiar with the maxim of proceeding from the concrete to the abstract. Viewed as a protest against neglecting individual objects and events, and against beginning with verbal definitions and rules, the maxim was both needed and intelligible. Viewed as a philosophic principle, however, modern logic has shown it to be defective and misleading. The mind does not begin, strictly speaking, with concretes and work toward the abstract; it begins with a blur, "a blooming, buzzing confusion" (James), which is general in the sense of vague, lacking adequate determination, and which is particular in the sense of local and temporary. From this, the mind works in the directions both of the concrete and the abstract; the gain in concreteness representing the growth of definitely marked out individuality, the gain in abstraction, the more precise recognition of the characteristic quality and relation which makes the individual object what it is. Concrete and abstract are thus correlative ideas: ideas that go coupled. Linguistically, they are represented by the relation of noun and adjective, verb and adverb. At first sight, it is more obvious that an adjective or adverb cannot exist alone than that a noun or verb cannot. But slight reflection will show that a thing without a quality, an action without a mode or manner, is as impossible as the converse, and that adjectives and adverbs are frequently omitted only because they are so necessary and so well understood that they may safely be assumed and omitted, leaving the mind free to note explicitly only inconstant qualifications. It would be fortunate for both logic and education, if the word "concretion" were in as current use as the term "abstraction"; for it would serve to remind us that the concreteness of an object is not equivalent to its physical or sense existence, but represents an intellectual achievement, due to combining constant qualities and relations (the recognition of which involves abstraction) in uniform ways. What is ordinarily called concrete means anything as to which this combining or synthetic act has been repeated so often that it has become habitual and automatic.

J. D.

**CONCRETE NUMBER.** — See DENOMINATE NUMBERS.

**CONDENSATION OF EXPERIENCE.** — Shrinkage in conscious content. The sensory content of mental experiences tends to sink below the level of consciousness or disappear, though at the same time it forms the clew to the interpretation of the experience. In other words, the experience acquires a meaning, while the awareness of that which supplies the meaning no longer remains, but leaves in its stead an attitude devoid of explicit sensory content. This tendency of experience in the direction of

condensation is a general characteristic of the mental life. Few of our experiences are as full of content as seems to be revealed by careful introspective or experimental analysis. In perceptual experience, for example, experimental analysis reveals the fact that perception of the third dimension (depth) is largely dependent upon the difference in the retinal images in the two eyes. This difference is, however, unnoticed in favor of the meaning of the total experience; that is, the difference is perceived or interpreted as meaning depth. The sensory elements of the experience become fused, explicit awareness of the difference in the retinal images disappearing. In a similar manner all objects which we perceive tend to become less rich in sensory content as we become familiar with them, while an active attitude toward the object remains and expresses itself in an habitual form of reaction. Condensation is also characteristic of conceptual thinking, as may be shown from the distinction between conceptual and practical judgments (Hobhouse). A practical judgment is based upon the concrete revival (memory) of a former experience; the conceptual judgment is based upon many former experiences, which, however, are not present in consciousness except in the condensed form of an attitude governing the resulting action. Experiment has shown that children tend to think in terms of the revival of concrete experiences, while adults depend more upon condensed forms of experience.

**CONDILLAC, ÉTIENNE BONNOT DE** (1715–1780). — French philosopher. As a young man he was appointed tutor to the Duke of Parma, and wrote several of his essays as portions of a course of study for his pupil. Condillac started philosophically from Locke's empiricism and attempted to work out a pure sensationalism, maintaining, against the faculty theory prevalent in his day, that there are no features in experience which are not present in mere sensation. In his plan of education Condillac urged the early training of reasoning against exclusive memory work; and observation and experiment instead of verbal instruction. The most important writings of Condillac are: *Essai sur l'origine des connaissances humaines*; *Traité des systèmes*; *Traité des sensations*, and *Cours d'études*.

**CONDORCET, MARIE JEAN ANTOINE NICOLAS CARITAT, MARQUISE DE** (1743–1794). — Mathematician, philosopher, and

politician. Born at Ribemont in France, and educated by the Jesuits. He early showed an aptitude for mathematics and science, and in 1769 he became a member of the Academy of Science, of which he became secretary in 1777. In 1782 he became a member of the French Academy. He was an active contributor to the *Encyclopédie*. In 1785 he published his most important mathematical work, *Elément du calcul des probabilités*. About this time he entered politics and became secretary, and later president, of the National Assembly. He was opposed to the Terrorists, by whom he was outlawed, and after remaining in concealment for some time he was caught and thrown into prison, where he died in 1794.

As member of the National Assembly he drew up a report on the state of education before 1789 and a project for a new system. The project is of considerable interest. He had already given expression to his educational ideas in *Bibliothèque de l'homme public*, which contained five memoirs: *Nature et objet de l'instruction publique*; *De l'instruction commune pour les enfants*; *Sur l'instruction commune pour les hommes*; *Sur l'instruction relative aux professions*; *Sur l'instruction relative aux sciences*. It is divided into two sections, one dealing with Condorcet's philosophy of education, the other with his practical proposals. Education, he held, was essential in a democracy; for ignorance would endanger liberty and equality and lead to anarchy and despotism. Every citizen should be entitled to sufficient education to make him intellectually independent of others. This should serve as a minimum. Not only is education necessary for liberty and equality, but it forms the basis of morality and human progress. The aim of life should be inspired by a belief in the perfectibility of man on earth rather than by hopes of immortality in a future existence. To the progress of humanity all should have the power to contribute. Hence instruction should be universal. Educational institutions should be devoted to the teaching of nothing but truth, hence they should be independent of all political authority and free from the interference of public bodies. The development of new truths should be permitted, even though these may be at variance with the political creed and interests of the time. Liberty of thought is one of the rights of man, and on it depends the social progress and perfection. No religious or political doctrine should be taught, but moral instruction should be given. But the State should bear the expenses of education, which should be free to all in all its stages. Not only should the male sex enjoy the privilege of education, but it should be open to girls and women, who should study side by side with boys and men not only the same curriculum, but in the same classes. The education of women is an essential preparation for motherhood, wifehood,

A GROUP OF FRENCH EDUCATORS.

and comradeship of men. Condorcet was one of the first to suggest a departure from the traditional literary education and the inclusion of the sciences.

On the practical side Condorcet's proposals included elementary schools universally, higher elementary schools in districts and small towns, institutes or secondary schools, at least one in each department, lycées or colleges in large towns, and a National Society for Sciences and Arts. On the last the responsibility of supervision of the whole system was to devolve. The proposals of Condorcet were ordered to be printed, but in the political turmoil nothing came of them.

Into the philosophy of Condorcet it is not necessary to enter here. He was inspired throughout his life by his faith in human perfectibility, which he elaborated in *Esquisse d'un Tableau historique des progrès de l'esprit humain*.

**CONDUCT.**— A general term for the spirit and tenor of all the overt acts that constitute the behavior of an agent. As contrasted with the term "behavior," the word "conduct" is usually limited to acts that have an end consciously in view and that are preceded by more or less deliberation—in short, to such acts as have moral quality, actual or potential. There has been much dispute among moralists as to whether conduct or character (*q.v.*) is the proper object of moral judgment. The intuitional school has always held that inner motive and disposition is the true subject of moral worth; while the utilitarians have contended that such considerations are of sentimental importance alone, and that the moral criterion must be sought in overt acts and their consequences, since these alone affect the welfare of society. The Stoics, Kant, T. H. Green, Martineau, represent the former view; Bentham, the Mills, Herbert Spencer, the latter. As in so many philosophic disputes, the controversy seems to arise from a false disjunction between the inner and the outer, the mental and the physical. Conduct is an expression of intention, and intentions are influenced by disposition, are, indeed, functions of character; since different types of character will, in the same situation, entertain different aims. On the other hand, a motive or good will that does not strive to express itself in overt action is unreal and hypocritical. In the course of discussion, each school makes concessions to the standpoint of the opposed school which go far to bridge the seeming gap between them, or to reduce it to a matter of emphasis. Certainly the educator cannot proceed on any

other basis than that of the organic unity of conduct and character; he aims to modify disposition for the sake of influencing behavior, while it is only through the medium of overt acts that he has any approach to or leverage upon inner disposition. J. D.

**CONFERENCES.**— See TEACHERS, TRAINING OF, IN SERVICE.

**CONFIRMATION.**— See ADOLESCENCE; RELIGIOUS EDUCATION.

**CONFLICT.**— An important contribution to the working or dynamic logic of the human mind has been made in recognizing the part played in thought by conflict of stimuli, impulses, and habits. The antithetical character habit and attention has long been perceived; matters under habitual control tending to sink below explicit consciousness so that conscious attention is freed to deal with the novel and the difficult. By a further extension of the same principle it was recognized that wherever functions are performed with ease and adequacy and subject matter is harmoniously organized, there is no occasion or need for reflective thought. On the other hand, when responses (practical or intellectual) do not occur smoothly and effectively, thinking is required. Upon analysis, breaks and failures in responsive adjustment are found to be due to conflict of conditions or aims. When one stimulus tends to evoke one response, while another stimulus is acting in another and incomplete direction, or when inconsistent aims present themselves simultaneously, reflective thought is demanded in order to discover a new single stimulus which will coordinate the conflicting ones, or to project a comprehensive aim which will reconcile those opposing each other. The natural cue and occasion of thinking seems always to be found in some such situation. The lesson to be drawn as regards methods of teaching is obvious. The instructor stimulates thinking most successfully either by presenting the old or familiar under such conditions that unexpected discrepancies and incompatibilities appear in it, or by presenting the new in such a way that it both excites and resists assimilation by the old. Thinking is the natural consequence of such conflict—which, in more technical logical literature, is often called "tension." J. D.

**CONFUCIANISM AND EDUCATION.**— Confucius was born 551 B.C. His father—large, brave, and of great strength—was 70 years old when he married, so that, like Franklin, he was the child of his father's old age. He was

a careful student of history, poetry, and human nature (but not a philosopher like Laotze and Chuangtzi), a lover of morals, with a strong ritualistic tendency, and a born teacher. He married at 19, but divorced his wife after she had borne him a son. He was appointed keeper of the stores of grain and guardian of the fields, but gave up official life at 22, and began his career as a teacher. At 28 he studied archery and music. At 30, or thereabout, he visited Laotze, the founder of Taoism, and after returning to his native place, he was surrounded by 3000 pupils, from which time he spent his life in imparting to them the rules of conduct and the principles of government. His descendants live to-day — the most renowned family in China.

Confucius has inspired the peoples of eastern Asia to a pursuit of the intellectual in the same way as Jesus Christ has inspired the peoples of western Europe to the pursuit of the spiritual, and has received from them the same kind of homage. His system of education, however, has been *memoriter*, has contributed to the development, for the most part, of only the reproductive faculties, and has done but little toward the development of the thinking powers — the reason and invention. It was of a moral and political nature, and in no way religious. He did not know men; how could he know God? He did not understand life; how could he understand death? These are the substance of some of his own statements. His highest hope was to develop a prince who would rule justly, and a people who would live righteously and obey implicitly the laws of the land. To this end he edited the *Books of Poetry, History, Changes, and Rites*, and wrote the *Spring and Autumn*. These have been made both the bible and the textbooks of all students from that time until the recent reforms of Kuang Hsü, which have started a new régime in China. They are called the *Five Classics*, and have been studied for twenty-three centuries by all Chinese boys, in their homes, or in private or governmental schools, under tutors or teachers, who have themselves passed or are preparing to enter the public examinations for preferment to official life. They are committed to memory so thoroughly that when the teacher gives a clue, the student can continue the sentence, — as much of a necessity in the learning of the language as in the understanding of the book, — after which they are explained by the instructor and the student studies the commentary.

During what may be called "the war for supremacy of the three religions" (200 to 700 A.D.), the "dark ages" of China, each cult erected schools or temples for the propagation of its tenets. The Confucianists decorated their schools with portraits of their great men, the Taoists and Buddhists with paintings of their gods. It was thus they developed Chinese art, and appealed to the people for support.

The Taoists were the alchemists and so-called scientists, the Buddhists the religionists, while the Confucianists appealed to the intelligence of the people and their love of learning only, except as they forced upon them the worship of their ancestors. Confucianism contributed to the intellectual development of the people, and their establishment in morals, while Taoism and Buddhism were indifferent even to the education of their priests, and so Confucianism finally became the first of the three systems and the recognized conservator of Chinese education.

CONGREGATIONAL COLLEGE OF CANADA, MONTREAL, CANADA. — An institution which arose in 1864 from the amalgamation of two older Congregational theological institutes in Montreal and Toronto. The present title was adopted in 1884. Since 1865 the college has been affiliated with McGill University. The original and still the primary purpose of the college was to prepare ministers for the denomination. Candidates are received on the recommendation of their pastors. The students take their literary courses usually at McGill and the theological at the College. Graduates in arts are given at the end of a three-year course and the completion of the requirements the degree of Bachelor of Divinity. There are five professors.

CONGRESSIONAL LIBRARY. — The Library of Congress, Washington, D.C., was established by act of Congress, Apr. 24, 1800. In 1870 it was made the federal copyright office, and in 1897, upon removal to a separate build-

ing, it was reorganized with a view to national as well as legislative service. The building of the Library of Congress, the largest and most splendid library building in the world, was completed in 1897 at a cost of \$6,347,000. With recent additions to its book stacks it has a shelving capacity of about three million volumes and seats for about a thousand readers. The library budget for the year 1909-1910 was for salaries \$369,171.83; for the purchase of books, \$108,000; for care and maintenance of building, \$137,205; total, \$621,676.83. There is also an appropriation of \$202,000 for printing and binding. Its printed books include the most complete collection of United States and foreign documents, national, state, and city, in this country; one of the largest collections of the publications of learned societies, — a collection accumulated largely by the Smithsonian Institution (*q.v.*); and one of the largest collections of newspapers, domestic and foreign. (*A check list of American newspapers*, 1901, 292 pp. *Check list of foreign newspapers*, 1904, 711 pp.) The collection of Americana includes, in addition to publications deposited in the library in compliance with the requirements of the copyright law, the library of President Jefferson, purchased in 1814 (*Catalogue of the Library of the United States*, 1815, 170 pp.) and the library of Peter Force, purchased in 1867. Among the more notable collections of foreign publications are the Yudin collection of Slavic literature, 80,000 volumes; a Japanese collection of about 9000 works; and the Huitfeldt-Kaas collection of Scandinavian books, 5000 volumes. The manuscript collections include the papers of Presidents Washington, Jefferson, Madison, Monroe, Jackson, Van Buren, Polk, Pierce, and Johnson; the papers of the Continental Congress; of Benjamin Franklin, Alexander Hamilton, Daniel Webster, and many other statesmen. Calendars of some of these have been published by the Department of State; others by the Library of Congress. The map collections are especially rich in maps of America, the Kohl collection, etc. (*List of geographical atlases*, 1909, 2 vols. *List of maps of America*, 1901, 1134 pp.) The print collections include the Hubbard collection (*Catalogue*, 1905, 517 pp.), and the Noyes collection, the latter confined to Japanese prints (*Catalogue*, 1906, 32 pp.). The Music Division, established in 1897, published in 1908 its first catalogue, a catalogue of full scores of dramatic music (170 pp.).

The collections numbered in 1909: Books, 1,702,685; maps and charts, 111,343; music (volumes and pieces), 501,293; prints (pieces), 303,036. The bibliographical service of the library consists chiefly in the publication of (1) unedited manuscripts in its possession; (2) a monthly catalogue of copyright entries of books and other articles deposited under the copyright law; (3) catalogue cards for all books acquired by action of the copyright law, by purchase or

otherwise; (4) miscellaneous bibliographical publications.

The library is open from 9 A.M. to 10 P.M. on week days; and from 2 P.M. to 10 P.M. on Sundays. Inter-library loans are made in the interests of advanced research. W. D. J.

**CONGRUENCE.** — A term used in modern mathematics to denote various relations. In particular, two numbers are said to be congruent with respect to a certain modulus when the remainders arising from dividing by this modulus are equal. This is expressed, for example, in this way:  $17 \equiv 62$  (modulo 9), meaning that the remainders arising from dividing 17 and 62 by 9 are equal. The theory of congruences plays an important part in the general theory of numbers. The word is coming into use in the teaching of elementary geometry to mean "identically equal," that is, equal in all their parts. Thus, two triangles are congruent if two sides and the included angle of the one are respectively equal to the corresponding parts of the other. This use of the term avoids the lax employment of the word "equal," which has a variety of meanings, usually referring to numerical measure. The tendency in teaching elementary geometry at present is, therefore, to use "congruent" for "identically equal," and "equal" for "equivalent." When equality necessitates congruence, as in the case of two equal straight lines, the word "equal" is sufficient. D. E. S.

**CONICS.** — A name given to the three typical conic sections made by a plane cutting a cone of revolution. A cone of revolution is a solid formed by the revolution of a right triangle about one of the sides forming the right angle. Any position of the hypotenuse, as the triangle revolves, is called an element of the cone. More generally, a line that constantly passes through a fixed point (the vertex) and constantly touches a fixed curve (the directrix) generates a conic surface, part of which lies on one side of the vertex and part on the other, these two parts forming the two nappes of the cone. If a plane cuts a cone of revolution so as to intersect all of the elements on one side of the vertex, the conic section formed is an *ellipse*. If the plane is parallel to an element, the conic section formed is a *parabola*. If the plane cuts the elements on opposite sides of the vertex, the conic section formed is an *hyperbola*. These sections seem first to have been discovered by Menæchmus, a pupil of Eudoxus and a con-

temporary of Plato, and to have been used by him in the duplication of the cube. Eratosthenes speaks of them as the "triads of Menachmus." The subject occupied the attention of several Greek writers. Aristæus the Elder (c. 320 B.C.) wrote a work on "solid loci," which was really a treatise on conics. In this he uses the names "sections of a right-angled, acute-angled, and obtuse-angled cone," which were the common names in use up to the time of Apollonius. Euclid (*q.v.*) also wrote a work on conics covering about the field of the first three books of Apollonius. Archimedes (*q.v.*) included a considerable treatment of conics in his works, notably *On Conoids and Spheroids*, but did not, so far as known, write a separate treatise on the subject. There are, however, a number of propositions known to be due to him, the best-known one being that relating to the area of a parabola: "Every segment bounded by a parabola and a chord is four-thirds of the triangle which has the same base and an equal altitude." The greatest of the ancient writers upon conics was Apollonius of Perga, in Pamphylia. He was born in the reign of Ptolemy Euergetes (247-222 B.C.) and studied at Alexandria. His work consisted of eight "books," of which only seven are extant, four in the original Greek and the rest in Arabic translations.

The treatment of conics by the ancients was purely geometric, like the treatment of plane geometry by Euclid. Apollonius knew and proved the most important propositions on the subject which we now treat by the methods of analytic geometry (*q.v.*). The invention of this latter theory (1637) opened a new era for conics, and from that time to the present the Greek methods have slowly given way to the analytic treatment. At the present time "geometric conics" are rarely studied except as an interesting part of the history of mathematics.

**CONNECTICUT AGRICULTURAL COLLEGE, STORRS, CONN.**—Established in 1881 by the Connecticut General Assembly to educate the sons of citizens of the state in scientific methods of agriculture. Since 1893, young women have been admitted. The college receives annual appropriations from the state and federal government under the acts providing for grants to such institutions. The college is under the control of a board of trustees of 11 members representing the state, the alumni,

and Board of Agriculture. The Governor is a member of the board *ex officio*. Candidates for admission must be 15 years of age. Academic courses extending over two years and covering that period of high school work are given. Specialization begins in the third year, and extends over three years. Courses are provided in agriculture, mechanical arts, and home economics. The degree of bachelor of science is given on completion of a sixth year of work in agriculture. There are 13 professors, and 11 instructors and assistants.

See AGRICULTURAL EDUCATION.

**CONNECTICUT, STATE OF.**—One of the original thirteen states. It has a land area of only 4845 square miles, and only two states, Delaware and Rhode Island, are smaller. The state of New York is about ten times its size. In 1910 Connecticut had a population of 1,114,756, and a density of population of 230 persons per square mile. But three states had a greater density. For administrative purposes the state is divided into 8 counties, chiefly used for judicial purposes, and these are in turn divided into 168 towns. These towns correspond, in a general way, to a western township. In many of the towns the total population ranges from 500 to 800 inhabitants. The cities are sometimes conducted as a part of the town form of government, and sometimes they are independent districts which have been segregated from the town.

**Educational History.**—In the beginning two distinct colonies were established in Connecticut,—Connecticut colony (1635), with Hartford as its leading town, and New Haven colony (1638), with New Haven as its leading town. Schools of some kind were established some time after the arrival of the early colonists, each colony acting independently. The first code of laws of Connecticut colony (1650) required every town containing 50 families to "appoint one within their town to teach all such children as shall resort to him, to read and write," and every town of 100 families to "set up a grammar school, the masters thereof being able to instruct youths so far as they may be fitted for the university," and directed that the teachers should be paid either by the parents or masters of such children, or by the inhabitants in general. The New Haven colony code of 1655 made it the duty of parents and masters to teach children and apprentices to read. In 1665 the two colonies were united, and the Connecticut code became the law for the united colonies. In 1666 four counties were organized,—Hartford, New Haven, New London, and Fairfield, and in 1672 the grammar school requirement was changed to one such school in each country town, and 600 acres of land was granted to each county for the benefit of such a school. In 1678 the requirement for an elementary school was changed from 50 to 30 families. In

1690 the general court (legislature) granted £60 yearly to the grammar schools of New Haven and Hartford, and in 1693 each of the two remaining schools received £30. Despite these rather remarkable early laws and the watchfulness of the courts, many children were growing up in ignorance, and in 1690 it was made the duty of the grand jury to visit, at least once a year, each family suspected of evading the law, and parents or masters found guilty were to be fined 20s. for each neglected child or servant. In 1700 a town tax for schools was levied in the form of a law ordering that 40s. on the £1000 (2 mills), to be raised by additional taxation, be paid from the treasury of the colony to those towns which maintained their schools according to law, and in proportion to their respective tax lists and polls. Any deficiency in funds was to be made up from the income from school bequests, if any existed, and after that by the town and parents, in equal proportions, unless otherwise ordered. This law was changed to read 10s. in 1754; 20s. in 1766, and restored to 40s. in 1767, and then remained in force at that sum until 1820. In 1700 every town of 70 families was called upon to maintain a school for 11 months each year, and all smaller towns for 6 months. In 1712 these requirements were extended to all parishes, or societies, into which a number of towns had been divided for convenience in worship. The law of 1750 reenacted these provisions and codified all school laws then in force, and declared that the fund, derived from the sale of the school land in northwestern Connecticut in 1733, should be a perpetual fund for the support of schools in the different towns and societies.

In 1714 the first law relating to supervision was enacted. This directed the selectmen of each town "to inspect the state of all such schools as are appointed in said town, from time to time, and particularly once in each quarter of the year, . . . and to inquire into the qualifications of the masters of such schools and their diligence in attending to the service of said schools, together with the proficiency of the children under their care." This law remained in force until 1798, when each school society was required "to appoint a suitable number of persons, not exceeding nine, of competent skill and letters, to be overseers and visitors of schools," to whom was assigned the duty of examining teachers, approving their work, making rules and regulations for the schools, and directing the "instruction of youth in letters, religion, morals, and manners." In 1856, on the abolition of the school societies, the duty of appointing school visitors was given to the towns.

In 1733 the public lands belonging to the colony, lying in what is now the northwestern part of the state, were set apart to form a permanent school fund, the proceeds of these lands, certain reservations excepted, to be distributed

among the different towns in proportion to their tax lists. All parishes and societies were to receive their due proportion, and on the same basis. The "school society funds," taken over by the towns on the abolition of the school societies in 1856, and now known as local funds, had their origin chiefly from the sale of these lands. The Connecticut School Fund (see under SCHOOL FUNDS.), which for half a century was the main support of the schools, came from the sale of the so-called Western Reserve. The colonial charter of Connecticut granted to the colony a strip of land west to the Pacific Ocean. A portion of this was ceded to Pennsylvania, and the remainder, with the exception of a reserve 120 miles long in northeastern Ohio, was ceded to the United States. In 1795 this reserve was sold for \$1,200,000, and this sum was set aside as a permanent school fund, the income to be distributed among the school societies in existence or to be formed, though by a two thirds vote the income might be used by the societies for the support of the Christian ministry or public worship. By careful management the fund was increased to over \$2,000,000 by 1849, and it has remained at about this figure ever since. The first income was distributed to the societies in 1799, on the basis of the taxable property and polls, but since 1820 it has been distributed in proportion to the number of census children 4-16 years of age. The income now is worth only about 50 cents per census child. In 1836 the United States Surplus Revenue fund was distributed, Connecticut's share being \$764,670.61. Of this amount one half was devoted to education and loaned out to the towns, and is locally known as the Town Deposit Fund. Much of it has been lost, and to-day remains only as a perpetual obligation, for which the towns tax themselves annually to pay the annual interest.

In 1766 the beginnings of the district system (*q.v.*) were made. Each town and parish was authorized to subdivide into districts of convenient size, and to maintain whatever number of schools seemed desirable. At first these districts were mere subdivisions of the towns, but in 1794 their separate existence was recognized by a law which enabled them to locate schoolhouses, levy taxes, and appoint collectors. In 1799 they were permitted to choose clerks and treasurers, and in 1839 they were recognized as bodies corporate and were authorized to elect their own committees. In 1795, 1798, and 1799 laws were passed by which parishes or societies were similarly invested with full control over schools within their limits, and were designated by the new name of "school societies." In 1856 an effort was made to undo this action and to return to the town basis. In this year the "school societies" were abolished, and their powers and duties were transferred to the towns. In 1865 towns were authorized to consolidate all of their

districts under town management, by a majority district vote, and in 1866 the towns were permitted to consolidate by vote of the town as a whole. A little over one half of the towns had voluntarily abandoned the district system by 1909, when on the recommendation of a special educational commission it was entirely abolished by law.

The law of 1795 with regard to the school fund, and the law of 1798 appointing school visitors and establishing supervision, practically revolutionized the system. The old county grammar school law of 1672 was repealed, though permission to form schools of higher grade than elementary was given. The new school fund soon produced so large an income, that, in 1820, a law was passed relieving the towns of the necessity of longer levying the tax, first required in 1700, as soon as the income from the school fund reached \$62,000. This came to pass in 1821, and from that date until 1839, when a district tax for current expenses was permitted, and until 1854, when the town tax was restored, the chief reliance of the districts for funds was the income from the school fund and assessments. The latter were authorized in 1810, and were levied on each head of a family in proportion to the number of pupils sent to school and the number of days attended by each.

The constitution adopted in 1818, superseding the colonial charter of 1662, contained only a short section on education. The charter of Yale College was confirmed, and the school fund was fixed as a sacred fund and set apart for the support of education alone. Beyond this the constitution was silent, and no mandate or direction as to schools was included. This provision has remained unchanged to the present time, and the progress which Connecticut has made in education since 1818 has been the result of good leadership and public sentiment, and not in response to constitutional requirements. The time of the adoption of the Connecticut constitution was a period of apathy in education in all New England; the large and increasing income from the Connecticut school fund was producing carelessness; private schools were on the increase; the schools of the school societies were poor; the pauper school idea had found favor in a number of states; and a general decline in educational interest had set in. This state of affairs continued well into the forties. In 1838 an investigation was ordered. In 1839 a Board of Commissioners for common schools was established. They were authorized to appoint a secretary who should "devote his whole time, if required, under the direction of the Board, to ascertain the condition, increase the interest, and promote the usefulness of the common schools." Henry Barnard (*q.v.*) was elected secretary, but in 1842 the legislature abolished both the board and the office. In 1845 the commissioner of the school fund, an official

created in 1810, was appointed Superintendent of Common Schools by the general assembly. In 1849 the first state normal school was established, and the principal of the school was made *ex officio* Superintendent of Common Schools. This put Henry Barnard back into office, a position which he continued to hold for the next six years. In 1865 the State Board of Education was created and required to elect a secretary, and this form of state supervision has continued ever since. Since 1850 the progress of the schools of Connecticut has been steady and marked. In 1854 an obligatory town tax of 1 cent on the \$100 for schools was established; in 1856 the "school societies" were abolished; in 1865 towns were permitted to return to the town system; in 1868 the town tax was ordered increased sufficiently to make the schools free, thus abolishing the rate bill; in 1871 the first state appropriation of 50 cents on census was made to the towns for schools, in 1872 the sum was raised to \$1.50, and since then it has been raised to \$2.25; in 1882 a compulsory education law was enacted; in 1884 state examinations for general state teachers' certificates were instituted; in 1885 evening schools were provided for; in 1886 the establishment of kindergartens was permitted, and laws regulating the employment of children were enacted; in 1886 town supervision, and in 1903 the consolidation of towns to form supervisory unions, with state aid for the salary of the superintendent, were permitted and provided for; in 1888 private schools were required to report to the state; in 1897 state aid was granted toward the payment of high school tuition fees for pupils from towns where no high school is maintained, and in 1903 state aid toward the payment of the transportation of such pupils was granted; in 1903 important legislation was enacted whereby the tax rate in poor towns is equalized down to 4 mills and the advantages of education are equalized up to \$25 per pupil in average daily attendance; in 1909 this was changed to a graded system whereby the aid was granted to a large range of towns; and in 1907 important state aid was granted to assist in the establishment of good trade schools.

**Present School System.** — The present school system of Connecticut is organized as follows: At the head of the system is a State Board of Education, composed of the Governor, Lieutenant-Governor, and Secretary of the Board, as *ex officio* members, and four others, appointed by the general assembly for four-year terms, one going out of office each year. Members are eligible for reappointment, but must be elected one from each congressional district of the state. This board appoints the Secretary and fixes his compensation, and the Secretary acts as the executive officer of the board, and virtually as a Superintendent of Public Instruction for the state. The State Board of Education has general supervision and con-

trol of the educational interests of the state; may designate textbooks for use in the schools; prepares all blanks and school registers; may examine teachers under such plan as it may deem best, and may grant certificates valid in the entire state; prepares means for making eyesight tests and furnishes the same to the schools of the state; may appoint a special agent to see that the laws relating to instruction are enforced; is charged with the duty of enforcing the child labor laws, and may appoint state agents to see to their enforcement; must hold meetings of teachers and school officers annually; acts as a trustee for and has complete charge of the four normal schools of the state; approves the course of instruction, buildings, and equipment, and the teachers in all trade schools receiving state aid; and must make an annual report to the Governor.

The counties of Connecticut have no educational function other than the maintenance of temporary home schools for dependent children, which are established and controlled by the county commissioners, and subject to inspection by the State Board of Education. There are no county boards of education, county superintendents, county teachers' examinations or certificates, or county school tax. The next administrative unit for schools below the state is the town, or independent district. All towns are required to maintain thirty-six weeks of school in all schools, under penalty of forfeiting all state aid. Every town having any local school fund must annually elect a treasurer to look after it, and towns having a town deposit fund must elect an agent to loan it out and care for it. Schools must be open to all children over five years of age, and may be thrown open to all over four years. Kindergartens may be established in any town, and may be open to all over three. Any town at its annual meeting may vote to provide free text books for all its school children, and, on petition of twenty voters, must submit the question to an election. Women may vote on school questions, and are eligible for school offices. If the town contains 10,000 or more inhabitants, it must, and smaller towns may, provide evening schools for the instruction of those over fourteen years of age. Evening schools must be maintained seventy-five evenings each year. Towns that neglect or refuse to provide proper school facilities forfeit to the state an amount equal to that which should have been raised. Any town may vote to establish a trade school for the instruction of those over sixteen years of age, or may unite with other towns for this purpose. Any town may employ a superintendent of schools, or unite with other towns for the purpose, the state paying half of the superintendent's salary. If a town has less than twenty teachers, which is the case in more than two thirds of the towns, it may petition the State Board of Education for a superintendent, and this board will then designate an agent (super-

intendent), who supervises the schools and reports to the State Board of Education. The State Board will also pay three fourths of his salary. Every town must see that its school-houses are kept clean and in a sanitary condition; may appoint a school physician to examine teachers, janitors, buildings, and children, and to serve as medical inspector; and may appoint a matron or nurse.

The schools of the town are operated as a unit by the town school committee, consisting of three, six, nine, or twelve members, as the selectmen of the town may determine. They are elected by ballot in the annual town meeting, and one third go out of office each year. If the town has formerly been managed under the district system, the town school committee succeeds to all the functions of the various district committees, board of school visitors, and high school committees, which it supersedes. This town school committee maintains as many schools as it deems necessary in the different parts of the town; may close small schools, and provide transportation to other schools instead; manages the school property; examines, employs, pays, and dismisses teachers; determines the number and the qualifications of the pupils to be admitted to the different schools, and determines the school boundary lines; may elect a town superintendent of schools, and fix his salary; compiles, or has compiled, an annual school census of all children four to sixteen years of age, by ages and by school attendance; determines each year, in conjunction with the selectmen of the town, the amount of money necessary to maintain the schools during the ensuing year; compiles an annual financial statement and report, and submits a copy to the annual town meeting; and has control of the high schools of the town.

Certain cities, originally districts of the towns, have been organized as special districts. Fourteen districts or towns have been organized under special laws, in which the school affairs are under the control of a board of education, possessing the powers of a town school committee with certain additional powers granted to it under the special law of organization. (See special articles on HARTFORD, and NEW HAVEN, as examples of such special city districts.)

**School Support.**—Most of the money expended on schools in Connecticut comes from local sources. The last report of the Secretary of the State Board gives the following summary of receipts:—

Income on State School Fund . . .	2.88 per cent
Income on Town Deposit Fund . . .	.69 per cent
Income on local permanent funds . . .	.22 per cent
Income from state taxes for schools . . .	1.08 per cent
Income from town taxes . . . . .	60.21 per cent
Income from district taxes . . . . .	19.51 per cent
Income from voluntary contributions . . . . .	1.08 per cent
Income from tuition fees . . . . .	.98 per cent
Income from other sources . . . . .	3.62 per cent
Income from state grants for attendance, evening schools, libraries, supervision and administration . . . . .	9.73 per cent

The state gives to each town \$2.25 direct for every child four to sixteen years of age on the census rolls; \$2.25 per pupil in average attendance seventy-five evenings in evening schools; pays two thirds (up to \$30) of the tuition fees of high school pupils from towns where no high school is maintained, and one half (up to \$20) of the annual transportation expenses for attending; pays one half (maximum grant, \$800) of the salary of town superintendents of schools in supervisory unions, and three fourths of the salary of an agent (superintendent) appointed by the State Board of Education to towns having less than twenty teachers; pays a grant of \$5 per year per 100 pupils to schools for a school library, provided they raise a similar amount for the same purpose; and grants \$50,000 per year to towns (limited at present to two) to help in maintaining a town trade school, the town being required to duplicate the amount given. Since 1903 the state has also granted extra aid to any town applying for it which has a valuation of less than half a million dollars. In 1907 this was extended to towns having a valuation of less than one million, and in 1909 to towns having a valuation up to one and three quarter millions. Such aid is granted on application to such eligible towns as collect and expend for schools for maintenance only the following amounts: If not over \$500,000 valuation, a tax of three mills; if over \$500,000 and less than \$1,000,000, a tax of three and one half mills; if over \$1,000,000 and less than \$1,250,000, a tax of four mills; if over \$1,250,000 and less than \$1,750,000, a tax of six mills. The amount so granted is such as will enable the town to expend \$25 per year per pupil in average daily attendance, the grant to be used for teachers' wages only. This grant, on the average, paid 60 per cent of the teachers' wages in the aided towns, and enabled such towns to pay \$38 to \$40 a month to their teachers. Only about three fifths of the eligible towns had availed themselves of the grant by 1906. The remainder of the school money, aside from the income from permanent funds, comes from taxes levied by the town school committee, acting in conjunction with the selectmen of the towns. Any amount expended in excess of their estimates must be raised in the districts.

The total expenditure for education in Connecticut during the last year for which statistics are available was \$4,968,700. Based on the total population of the state, this was equal to a per capita expenditure of \$4.79 a year. In expenditure for schools the state stands somewhat above the average for the United States as a whole, but below that of any adjoining state. The average expenditure per pupil per day was 19.1 cents, as compared with 20.2 cents in Rhode Island, 22.94 cents in Massachusetts, and 26.94 cents in New York. In amount raised per child five to eighteen years of age (\$21.15); in amount raised per adult male

(\$15.71); or on the expenditure for schools on the \$100 of wealth (25.8 cents at last report); Connecticut occupies about the same relative position. In most items of expenditure Connecticut expends about the same amount as the states of the North Central Division, but due to its much greater density of population and much smaller percentage of children of school age (22.9 per cent as against 28.2 per cent for the North Central Division), Connecticut should be able to do much more each year with the money it has than the North Central states are able to do. In increase of school expenditure during the past thirty years, Connecticut has been outstripped by its neighbors.

**Educational Conditions.**—Connecticut has long been noted for its vigilance in the matter of the attendance of its pupils at school, and in the protection of its children. The school attendance and child labor laws, and the enforcement of them, are among the best in the Union. All children seven to sixteen years of age must attend schools while they are in session; children over fourteen years of age may be excused from attendance, if their education is satisfactory, and if they are at work; no child under fourteen can be employed in any mechanical, mercantile, or manufacturing establishment at all, and no child under sixteen unless provided with a proper certificate. Employers must keep age and schooling certificates on file; agents are appointed to enforce the law; and heavy fines are imposed for violations. Each town is also charged with the duty of enforcing these laws. The school term required is long (nine months), and the average number of days attended by each pupil enrolled (141.2 days) is only exceeded by three other states, all being in the North Atlantic group. Massachusetts was highest, with 154 days, while the average for the United States as a whole was but 109.8 days. In the percentage of average daily attendance based on the number enrolled, Connecticut, with 76.5 per cent, was exceeded by nine other states only, Massachusetts again being highest, with 81.9 per cent.

Only five states, two of them in the West, with a high percentage of men, have less children five to eighteen years of age in the total population than has Connecticut, with 22.9 per cent. Nevada is lowest, with 21.3 per cent; South Carolina is highest, with 31.6 per cent; while the average for the United States as a whole is 28.3 per cent. In illiteracy, 5.9 per cent of the total population ten years of age or over was illiterate in 1900, but this large illiteracy is confined almost entirely to the foreign-born element in the population (26.6 per cent of the total), which has crowded into the cities and manufacturing towns within recent years. In an effort to cut down and keep down this illiteracy, school attendance has been rigidly insisted on, and to enforce the attendance laws better all private schools have been required,

since 1888, to keep a state school register and to report full statistics on all items except finance to the public school authorities. Attendance at private schools is enforced on the same basis as attendance at public schools. Of the total enrollment in all schools in 1908, 17 per cent were enrolled in private schools, and 12.5 per cent in parochial schools. The parochial schools, nearly all Catholic, are well organized, and enroll a large proportion of the children in the manufacturing towns, and in towns having a large foreign population.

The large towns and cities are well equipped with good school buildings and teaching appliances, have good teachers, pay good salaries, and have excellent schools. Thus they are able to do with ease and on a low tax rate, because of their greater wealth and density of population, and because of the long-established state policy of requiring that the school system be supported largely by local taxation. On the other hand, the schools in many of the smaller and poorer towns are badly supplied with buildings or teaching equipment, pay small wages, have untrained teachers, and maintain inefficient schools, because, under a system of local support, the best that they can provide is inadequate to meet present-day needs. Of the teachers of the state, 2.5 per cent are still paid less than \$25 per month. The rural school-houses have been greatly improved within recent years, especially from a sanitary point of view, but many still leave much to be desired, and about two thirds of the school buildings and about one eighth of the teachers belong to the single-room district school class.

Kindergartens are maintained by 32 towns, 31 towns maintain evening schools for those over 14 years of age, and 9 towns or districts offer instruction in manual training. After forty years of granting small subsidies, but little has been done toward building up school libraries, as not more than 112 out of 168 towns report schools as having school libraries, and the 914 school libraries in 1908 averaged only twenty-five volumes to the library. The state, on the other hand, is well supplied with public libraries, which are under the supervision of a State Library Commission of five, appointed by the State Board of Education to travel about, give advice, and assist the public libraries of the state. Each public library receives \$100 a year aid from the state for books approved by the Library Commission, provided the library raises a similar sum.

**Teachers and Training.** — The state certification plan, by which the State Board of Education gives examinations and grants certificates, valid in any town or district in the state, has made headway slowly since its inauguration in 1884, but so far only about 25 per cent of the 5025 teachers employed in the state hold state certificates. The remainder of the teachers secured their certificates from the local authorities. Boards of education in cities, and town

school committees in the towns, or committees appointed by them, are authorized to examine all applicants as to their moral character, and in reading, writing, arithmetic, and grammar, and in the rudiments of geography, history, and drawing. If the candidate is to teach above the third grade, the examination must include temperance, physiology, and hygiene. Certificates valid to teach in the town are granted to teachers meeting this test, which is not generally administered in a severe manner, though the certificate may be limited in time and to a particular district, or school, if the examining authorities so decide. The state examinations are much more rigidly conducted, and the certificates granted represent a much higher standard than most town certificates. The State Board grants certificates on examination, as follows: (1) statutory certificates, on the statutory school subjects, and strictly limited in time and to a particular town; (2) elementary certificates of two grades, based on an examination in additional subjects, and valid in any school in the state; (3) certificates of special preparation, of two grades; (4) kindergarten certificates, of two grades; (5) supervisory certificates, of two grades. Evidence of education and preparation is required in advance of the examination, and may be accepted in lieu of certain parts of it. No provision exists as yet for the certification of normal or college graduates on credentials, or for the recognition of teachers' certificates from other states.

The State Board of Education maintains four state normal schools for the preparation of teachers, located at Danbury, New Britain, New Haven, and Willimantic, and the city of Bridgeport maintains a city normal school. About 45 per cent of the teachers of the state have attended some normal school, but the normal graduates are located almost entirely in the cities. For the improvement of those in service the state appropriates \$3000 each year to enable the State Board of Education to hold teachers' meetings at various points in the state.

**Secondary Education.** — Public high schools were maintained in sixty-one towns and eighteen districts. Besides these, eighty-three additional towns provide for their high school pupils in adjoining towns, and sixty-seven of the eighty-three provide transportation for the pupils in addition. The State Board has approved five private academies for the attendance of non-resident pupils from towns not maintaining high schools, something which would not be permissible in most states. Any town may establish a high school, build a building, and levy a high school tax, but as one third of the towns have less than nine, and one half of the towns have less than thirteen teachers employed, a high school in every town is obviously unnecessary. Towns not maintaining high schools, but which agree to pay the tuition fees of their high school pupils in the high school or academy

of some neighboring town, as well as the expenses of transportation incident to such attendance, both of which are still optional with the town, will be reimbursed for two thirds of the tuition and one half of the transportation paid, up to a maximum state grant of \$30 for tuition and \$20 for transportation per pupil per year.

Evening high schools are maintained by thirty-one towns for the instruction of those over fourteen years of age, and the state has recently (1907) agreed to pay one half of the expense, with a maximum grant of not over \$25,000 a year each for not over two schools, of maintaining an efficient town trade school for the education of those over sixteen years of age, who have completed the eighth grade of the public schools. Buildings, equipment, course of study, and qualifications of the teachers are in such cases to be approved by the State Board of Education.

**Higher and Special Education.**—There is no state university maintained by the state. The Connecticut Agricultural College at Storrs (*q.v.*), opened in 1881, is a land-grant college offering instruction in agriculture and domestic science to a small student body, to which the state makes but a small appropriation for support (\$20,000 in 1907-1908). The state maintains the Connecticut (industrial) School for Boys, at Meriden; and the Industrial School for Girls, at Middletown, both of which are reformatory institutions. The state also maintains the Connecticut Institute for the Blind, at Hartford; the American School for the Deaf, at Hartford; and the Oral School for the Deaf, at Mystic.

Yale University (*q.v.*) at New Haven, opened in 1701; Trinity College (*q.v.*) at Hartford, opened in 1824; and Wesleyan University (*q.v.*) at Middletown, opened in 1831, are three non-sectarian institutions of higher learning, for men only, maintained by private funds within the state. There are no institutions of higher learning in the state which are open to women, except the State Agricultural College, which offers courses only in agricultural and household economy. In 1911 Morton P. Plant gave \$1,000,000 to found the Connecticut College for Women to be located at New London. E. P. C.

**CONNOTATION.**—See MEANING; TERMS.

**CONSCIENCE CLAUSE.**—A provision inserted in the English Education Act of 1870 to safeguard the religious beliefs of children attending public elementary schools. The clause by the Education Act of 1902 was made applicable to all institutions receiving state grants. In schools provided out of public rates the Cowper Temple Clause (*q.v.*) applies. The Conscience Clause of 1870 runs as follows: "It shall not be required, as a condition of any child being admitted into or continuing in the school, that he shall attend or abstain from attending any Sunday School, or any place of religious worship, or that he shall attend any religious observance or any instruction in religious subjects in the school or elsewhere, from which observance or instruction he may be withdrawn by his parent, or that he shall, if withdrawn by his parent, attend the school on any day exclusively set apart for religious observance by the religious body to which his parent belongs."

See BIBLE IN THE SCHOOLS; ENGLAND, EDUCATION IN; RELIGIOUS EDUCATION.

**CONSCIOUSNESS.**—A general term intended to include all the mental states of an individual. Our experiences from moment to moment, such as sensations and ideas, thoughts and feelings, perceptions and volitions, comprise the facts of consciousness. Its particular characteristics and varieties, with the conditions, both physical and mental, which determine their appearance, modification, and disappearance, constitute the topics of psychology. What it is to be in a state of consciousness can be told, not by definition, but by description. "What we are when we are awake, and what we are not when we fall into a quiet dreamless sleep; what we are when we go about our daily work, and what we are not when an overpowering blow upon the head is received,—that it is 'to be conscious'" (Ladd). This "vague and treacherous word 'consciousness'" (Ward) has given rise to much debate in the history of psychology. Etymologically it refers to intellectual activity, and an early meaning interpreted it as designating the particular power by which the mind knows its own states or processes, or as the faculty which causes the mind to come to self-knowledge. At times even it has been used to specify a real entity.

The most striking and significant traits of consciousness, particularly that of man, are its increasing complexity and its development, whether regarded in the individual or in the race. The presence of these characteristics leads one to understand why a scientific study of mental facts requires the consistent maintenance of both a cross-sectional, analytic point of view (as in descriptive psychology), and a longitudinal or functional point of view (as in genetic psychology). Both standpoints are necessary in order to prevent an oversight of important facts and a neglect of their later significance in the modification of experience.

Consciousness may be studied in its entirety and as a unit (as, e.g. James, Ladd, Morgan), or it may be approached through an analysis of its processes and their functions (as, e.g. Angell, Judd, Thorndike). By the former mode, it is discovered to be a "stream," made up of a succession of "conscious fields," which differ in extent, intensity, or vividness, predominant quality, rate of movement, and is always marked by an exercise of a selective activity and by a tendency to become "personal," yet breaking up into parts such as "focal" and "marginal," or "substantive" and "transitive." By the other mode of approach, we have brought to our attention the different kinds of mental facts, their leading qualities and significances being exhibited in the various classifications proposed: such as, the activities of knowing, feeling, willing (Ward); sensation factors, relations between sensations, attitudes, memory contributions to experience, and ideational relations (Judd); or, mental states which are what they stand for, those which are like what they stand for, and those which are unlike what they stand for (Thorndike).

Inasmuch as consciousness always tends to serve certain ends, and is interested more in the results than in the processes of actions, the functional point of view has recently come forward, placing emphasis upon the contribution made by the mind in the adjustment of the organism to its environment. When sufficient facts have been gathered under the direction of this principle, which is showing itself applicable to animal as well as to human consciousness, there will be at hand as a distinct result a phylogenetic picture of the evolution of consciousness as it makes its manifestations in the upward scale of zoölogical life.

The dependence of changes in consciousness in man upon physical and neural conditions, such as external stimulations, blood supply, fatigue and rest, etc., as well as upon the specific activities of more or less definite organs or areas in the nervous system, has been clearly set forth in the numerous studies in physiological psychology.

It is most important to observe that education as a process must always be regarded in terms of consciousness. This is the single channel through which all teaching and non-

teaching educative agencies can make their appeal to the individual. All sensory discriminations, useful images, formation of judgments, purposeful direction of movements, and every other occurrence required in the course of training and instruction must appear in the mind of the given person before education can be said to take place. An orderly control over the initial sequences of the conscious experiences of the child after its mental development has gone far enough to differentiate its chief processes, constitutes the fine art of teaching. Consciousness unifies capacities and actions by "dislocating experiences" (Minot) from their original setting and putting them into new relations which come to have directive significance for later interests and actions. When pupils are aware of the results desired, teachers realize that their efforts increase in efficiency. The different forms of learning are constantly dependent upon the presence of some conscious activity which leads the way to the next important thing to be done. The elimination of useless movements, in which all learning may be said to consist, finds its most favorable condition to be in a discrimination of those factors which are essential as contrasted with those which are unessential to the end to be attained. The services which consciousness seems to have performed in the indefinitely long series of organic changes called evolution, as well as the extraordinary development it has attained in man, alike indicate something of its supreme importance both as a means and as an end in human education. That there are certain mechanical and physiological stages set up through some conscious processes slipping into the background as experiences move forward (acquired reflexes, habits, association), shows still more conclusively the central position which consciousness occupies in education.

**CONSCIOUSNESS, CRITERIA OF.** — See ANIMAL PSYCHOLOGY.

**CONSOLIDATION OF SCHOOLS.** — Fifty years ago there was no country school problem. The country school and the city school were much alike. Each had small, cheap buildings, poor equipment, and practically no teaching apparatus. Each drew its teachers from the same source and paid them about the same salaries. Trained teachers, skilled supervision, teaching equipment, special instruction, an enriched curriculum, these and other things with which we are now so familiar were practically

unknown in city and country. But fifty years have seen great changes in American education, and in these changes the country school has been left far behind. The concentration of wealth has made it possible and the concentration of people has made it necessary that the cities should develop a class of schools capable of meeting the changed conditions of our life. They have provided more liberally for their schools, have drawn the best teachers to them, have developed high schools and supervision, have organized kindergartens, have provided laboratory and other teaching equipment, have added manual training, cooking, drawing, music, and nature study, and have done many other things which have made city schools attractive to parents who are solicitous for the education of their children. The smaller cities have made similar progress, and even the small village has a graded school and often a high school, good teachers, a system of supervision, teaching equipment, a course of study which includes some of the special branches, and a social spirit pervading the school which is of fine quality and of the first importance in the education of children.

The country school, on the contrary, has made little progress beyond where it was a generation ago. In many states it has been graded, to be sure, and uniform textbooks and a uniform course of study introduced, but these have usually added to the burdens of the teacher. The schools have been graded and the uniform examinations introduced as a test of efficiency, but this has too often served as a temptation to the teacher to neglect the younger pupils for the older ones who are to pass. Whenever the number of pupils has risen sufficiently high to make possible the employment of two teachers, the desire to have "a school close at home" has led to the division of the district. With the better preparation of teachers, in general, the quality of the country teaching has been improved, but even the best of teachers can make but little headway against such odds, and they leave at the first opportunity. The country school is poor, often miserably poor, compared with a good town school. This is chiefly due to its numerous classes, overburdened program, lack of equipment, and, above all, to its isolation and lack of that stimulus that comes only from numbers. The attendance is small, the children come from the same locality and have the same interests, and a majority are from related families. They bring no new interests to the school, there is little impulse to activity, and the school suffers from this lack of new ideas and impulse to action. Under present conditions the country school realizes but a small percentage of its possible efficiency, and many parents leave the farm and move to the town or the city, for the life of which they are not fitted, in order to give their children the advantages of a good education.

In regions where the population is sufficiently

numerous, the remedy for this condition of affairs lies in the concentration of a number of these small, scattered, inefficient rural schools into a union consolidated school of two, three, or four rooms; in the provision of a good corps of teachers; and then in the transportation of the children from their homes to the school in the morning, and back to their homes in the evening, paying the expense of such transportation out of the school funds. This is what is known as consolidation of schools, and the transportation of pupils. The plan, in brief, is as follows: Two, three, four, five, or more existing school districts, each maintaining a small, inefficient rural school, vote to unite their schools to form a union school or are consolidated by some central authority. A three or four-room schoolhouse, built on modern lines and well heated, lighted, and ventilated, is erected at a central location. Arrangements are made for the daily transportation of all pupils living at a distance. One of the teachers is usually a person of some experience, often a man, and is designated as principal. Often three or four of these union schools unite again in the employment of a supervising principal and sometimes of teachers of special branches, each of whom devotes such time to each of the union schools as is agreed upon or as is necessary, and is paid in proportion by the different unions. In a number of places where this plan has been tried, the stimulus to better schools has been so great that the same unions have united to form a high school, thus providing a city school system in the country, consisting of a high school, graded elementary schools, superintendent, principals, teachers, and janitors. Instead of a city in compact form, it is a city spread out. Coöperation of communities for greater effectiveness is the central principle, and the advantages are those which come from organized coöperation. The new element which makes this coöperation possible is transportation, — the carrying of the child to the school. This is only an old idea in a new form. For seventy-five years we have maintained that it was the duty of the state to provide each child with the opportunity to secure an education. In carrying out this idea we have carried the school to the child. This has led to the division of districts and the multiplication of small schools. These have been found to be expensive and inefficient. The new plan merely proposes to reverse the process and to carry the child to the school, — even more, to carry the child some distance to a much better school than he now has near at home.

The consolidation of rural schools and the formation of unions naturally cannot take place everywhere. Schools in mountainous districts, or where the roads are impassable, or where population is sparse, cannot well be consolidated. These will have to remain about as they are for some time, — probably for a long time to come. But in the better settled regions

there are certain natural concentrating centers, where unions could be formed with advantage, and in these places such unions should be formed as soon as the prejudices and the conservatism of communities can be overcome. Such a plan naturally possesses certain advantages, and also certain real or imaginary disadvantages. These may be stated, as follows, enumerating first the advantages, and then the disadvantages. The first and most important advantage is that such concentration means better schools. Fewer teachers will be needed, but better ones will be demanded and retained. The union school, with its graded rooms, will be such as to offer inducements to good teachers. Owing to the larger number of pupils in each grade, there will be present in the recitation work that stimulus which comes only from numbers. Owing to the larger number of pupils in the school as a whole and the new interests which this larger number will bring, there will be a social spirit present on the playground and in the school which will contribute greatly to the value of the education given. As a result of the presence of more than one teacher in the school, there will be developed a professional enthusiasm unknown in the isolated school. A second advantage will be a partial equalization of opportunities and advantages as between the boy in the city and the boy in the country, by bringing a school equal to a well-organized city school, with its many advantages, within reach of the boy on the farm. A third advantage is that such a combination of schools for greater effectiveness is also cheaper, though this cannot be made the chief reason for consolidation. The experience of states where the plan has been put into operation is that, in general, a better quality of education and a longer term of school, as well as transportation, can be provided at no greater expense than the aggregate cost of maintenance of a number of separate inefficient schools. In many unions a decided saving has been made, even after providing a better school and additional educational advantages. Another marked advantage of the plan is the greatly increased interest taken in the school by the people of the union district, after the school has once been established. The larger and better school develops a broader and a better educational spirit. More interest is taken in the larger school, better men are selected as trustees, better teachers are employed, a longer term of school is usually provided, school attendance is improved, the teaching equipment is increased, and the attitude of the community toward the school is changed. The school becomes a matter of pride instead of a matter of indifference to the community. The testimony on this point is universal.

In localities where the plan has not been tried it is often bitterly opposed, while in localities where the plan has been given a fair trial the people are strong in its support. In Massachusetts, Connecticut, Ohio, and Indiana, the most

vigorous opponents of the plan, at the time of its introduction, were later among its strongest supporters. The objections usually advanced to the plan by those who have not tried it, include these: It is claimed that it is impractical, but the experience of a dozen states disproves this. Some parents object to sending children "so far away from home," but, so long as the child is well cared for, the difference between one mile and five miles is negligible. Five miles with transportation is really nearer than one mile of walking. The ride is objected to by some, but it is better to take the child from his door and deliver him at the schoolhouse in the morning, safe, warm, and dry, and return him to his home each evening, than that he should walk even half a mile and miss school whenever the weather is bad. The argument that the country boy needs exercise is no argument, as he has more than enough exercise at home. A common argument against the plan is that the removal of the little local schoolhouse causes a depreciation in farm property in the immediate neighborhood, with a corresponding increase at the concentrating center. This appeals at once to local jealousy and to the pocketbook, and is an idea that is hard to eradicate. Experience elsewhere, however, is all on the other side. A schoolhouse on a farm does not necessarily make farm land valuable. What is wanted is that the opportunity of attending a good school be within easy reach of the children, and a good school six miles away, with transportation, will add more to the value of farm property than a poor school brought to within a quarter of a mile. Such, at least, is the experience of states where the plan has been tried. The novelty of the idea is to many an objection. Most communities move and think slowly, and many are content with things as they are, and oppose efforts looking toward change and improvement. For such people no amount of argument is so effective as a successful, centralized school in the vicinity. It was very difficult to introduce the first centralized schools of Ohio and Indiana, and the movement began slowly and, in Ohio, under carefully devised restrictions imposed by the legislature; now centralization is in process throughout the entire region, and the restrictions have all been removed.

The first state to pass an act permitting the consolidation of schools was New York (Union School Law of 1853, amended and incorporated as Title IX of the Consolidated School Act of 1864). This was followed by the passing of an act permitting both the consolidation of schools and the expenditure of funds for transportation by Massachusetts, in 1869. In 1874 the law was put into operation for the first time by the town of Quincy, but it was not until 1890 that the movement gained much headway, or the expense for transportation in the state reached \$25,000. Since that time the progress of the movement has been rapid. The movement was not taken

up in any other state until 1889, when the Connecticut legislature first authorized the consolidation of districts. The next legislation was in 1893, when Connecticut authorized the expenditure of funds for transportation, and Maine authorized the consolidation of schools. Rhode Island and New Hampshire followed in 1898, and Vermont in 1902. Pennsylvania authorized the expenditure of school money for transportation in 1897, and the consolidation of schools in 1901. Ohio first authorized the consolidation of one township in 1894; permitted consolidation in three counties in 1896, and made the law state-wide in 1898. Indiana first authorized consolidation and transportation in 1899. In some of these states local school authorities had previously initiated such plans without state authorization.

Partly due to the greater density of population, and partly due to the large number of small schools previously maintained, the movement has made much headway in the New England states. In Massachusetts no figures as to the cost for transportation were kept before 1889, when the yearly expense reached \$22,118. By 1897 it had exceeded \$100,000; by 1905 it had exceeded \$200,000; and at present amounts to close on \$300,000 a year. This is equal to about 14 per cent of the total cost of the school system of the state. In Connecticut 81 of the 168 towns had consolidated schools and were transporting pupils by 1909, and from 45 to 80 schools are being closed each year. The cost for transportation here is about 1 per cent of the cost of the system. In Vermont and Maine nearly 4 per cent of the total cost of the schools is expended for the transportation of pupils from abandoned schools. Towns in Rhode Island and schools in New Jersey are given an additional appropriation each year of \$200 for every school they have abandoned in the process of forming a consolidated school. Pennsylvania and New York have as yet done little with the idea, though the possibilities in each state are large.

Perhaps the greatest development of the plan has been in the states of the North Central Division, all of which, except Illinois, have laws permitting the formation of consolidated schools and the transportation of pupils. All new laws enacted in this group of states have been passed since 1894. In Ohio, Indiana, and Iowa perhaps the greatest success has been attained, and Indiana has probably done more with the plan than any other state in the Union. The great success of the plan in Indiana has been in great part due to the absence of the district system, and the consequent freedom for an intelligent township officer to go ahead and do what ought to be done. In the ten years from 1899, when the first law was passed, to 1909, the number of schools of less than twenty children was reduced from 4180 to 1755; 1611 small schools were abandoned;

and more or less complete consolidation was effected in 486 of the 1017 townships in the state, or, stated better, in 486 of the 595 townships in the state reporting roads which would permit of the consolidation of schools. Approximately 25,000 children are transported to and from school each day at public expense, and about 2500 privately. 1116 transportation wagons are used each day, at an average cost of \$2.07 per wagon, and about 500 children are transported daily in interurban trolley cars. Michigan, Wisconsin, Minnesota, and Nebraska have also made some good progress in inaugurating consolidation and transportation, and every other state in the division except Illinois has made a beginning.

Among the Southern states, some marked progress in the consolidation of small and unnecessary schools has been effected, since 1900, North Carolina, Georgia, Florida, and Louisiana having been most conspicuous in the work. On the other hand, no provision whatever for consolidation or transportation has so far been made in the laws in four other Southern states. The county system of school administration which prevails in most of the Southern states makes it easy to effect the consolidation of small and unprofitable schools.

In the states of the Western Division little has been accomplished, due largely to the distances between schools and to the scarcity of population. In five states and territories no laws have been enacted, while in the others the laws are merely permissive and are rather difficult to put into operation. All Western Division laws on the subject have been enacted since 1902. Except in a few rather well-populated portions of some of the Western states, the need is for more rather than for fewer districts.

All forms of transportation are employed. The Connecticut school reports list the different means employed in Connecticut, the number transported by each, and the daily and total cost. Transportation wagons, steam and electric cars, butcher and milk wagons, and allowances of money to parents are employed. The same is true of all of New England. In Ohio and Indiana we have the best examples of a well worked-out plan of transportation, with a special type of school transportation wagon, definite routes, yearly competitive bids and written contracts, drivers acting as truant officers and under bonds for the faithful performance of their contracts and for the proper care of the children, etc. The cost of transportation is relatively small, and usually very material gains in money as well as in educational efficiency are made by consolidating schools and transporting the pupils. In Indiana the average cost per wagon per day is \$2.07, which is equal to eleven cents per pupil per day, or \$13.20 per year for a six months' school. In Connecticut and Vermont the cost varies from year to year, but averages about

\$16 per pupil per year, though for a longer term of school. E. P. C.

CONSONANCE AND DISSONANCE. —

These terms refer to the relative agreement or disagreement of a combination of simultaneous tones. (See CHORD, DISCORD.) Three stages are usually distinguished: perfect consonance, imperfect consonance, and dissonance, although there is no sharp line of demarcation between them. Consonance is usually pleasant and dissonance unpleasant, but this is largely a matter of taste and mode of use. Consonance gives a feeling of rest, while dissonance gives rise to unrest, and must always be resolved before the end of a movement. The degree of agreement or disagreement varies with the complexity of the ratio which denotes the interval (*q.v.*), or the relation of the vibration frequencies of the combining tones. Thus, the octave, 1:2, and the fifth, 2:3, are perfect consonances; the major third, 4:5, the minor third, 5:6, and the minor sixth, 5:8, are imperfect consonances; combinations with more complex ratios are considered dissonant. There is great disagreement between musicians on the nature and limits of these demarcations. "Consonance and dissonance have been explained; (1) by an uncon-

scious apprehension of, and a conscious satisfaction and dissatisfaction with, simple and complex vibration ratios (Lipps); (2) by the presence or absence of beats (*q.v.*) (Helmholtz); (3) by degree of direct tone relationship (Wundt); (4) by degree of fusion of constituent tones (Stumpf, Külpe)." CONSTITUTIONAL PROVISIONS RELATING TO EDUCATION. —

Education was not mentioned in the Federal Constitution, this matter being one of a number which was left to the states to deal with as they saw fit. The failure to mention the subject in any way is easily understood. At that time education was not a national interest, but a purely local matter. The need of general education at that time was small indeed. The industrial development, which began with the Embargo of 1807 and the War of 1812, resulting in the development of the factory system and the specialization of labor; the development of new means of intercommunication, which began with the steamboat and the steam engine, and which substituted interdependence for the independence which had previously existed; and the development of labor organizations and the awakening of the many humanitarian movements, after about 1820, all of which began to claim education as a right and to demand tax-supported schools;—none of these had as yet manifested themselves when the Federal Constitution was formed. For the most part education was not then considered as a function of the State, and except in New England it was left to religious societies and to private individuals to provide for those who felt a need for it, and were able to pay for it.

Gradually this condition of indifference was changed to one of interest in public education, though the change took place but slowly and only after great efforts. The change was everywhere a gradual one, and it was accomplished only after vigorous campaigning, and against much opposition. The land grants of Congress to the new states for the benefit of common schools greatly stimulated the movement. The idea that education was a birthright and that free education was an economic and a political necessity was advanced, and was accepted gradually by our people. Just when this change took place cannot be definitely stated. In a general way it had clearly begun by 1830, but was not accomplished in many states even of the North until after the Civil War. The vital educational awakening of the people of the South is a matter of the last decade. (See

SOUTHERN EDUCATIONAL MOVEMENT.) Today the right to a full and complete education at public expense may be regarded as a settled conviction of our people, and education has become to-day one of the greatest interests of the states and of the nation.

In May, 1776, the Continental Congress recommended that the states, where the existing governments were not sufficient, "adopt such government as shall, in the opinion of the representatives of the people, best conduce to the happiness and safety of their constituents in particular and America in general." All of the states except Connecticut and Rhode Island, which considered their colonial charters sufficient, drew up and adopted more or less perfectly worked out constitutions. Most of the states revised their constitutions at the time of entering the Union, and a number amended their constitutions one or more times during the first two or three decades of their national life. Three new states, Vermont in 1791, Kentucky in 1792, and Tennessee in 1796, entered the Union before 1800, and likewise framed constitutions. During the next fifty years fifteen additional states were admitted to the Union, and these included every state east of the Mississippi River and all of the states in the first tier west of the river except Minnesota.

An analysis of the provisions contained in these early constitutional provisions reveals much as to the feeling at that time toward education as an interest of the state. Seven of the first constitutions in the eleven original states framing them made no mention of the subject; Georgia authorized its legislatures to establish schools, according to its discretion; Pennsylvania and North Carolina directed their legislatures to establish schools, in which the masters, owing to subsidies, should "instruct at low prices." Massachusetts made careful provision for the safety and perpetuity of Harvard College, and added a general section on the encouragement of learning, which has remained unchanged ever since. When New Hampshire was admitted as a separate state it copied the Massachusetts general section. Pennsylvania, in its second constitution of 1790, made provision for the organization of charity schools in the state. In some of the states the first constitutional mention of education does not occur until well along toward the middle of the nineteenth century, and in most of the Southern states no definite provision for a system of education was made until after the Civil War.

The constitutions of the New England states have been changed but little, and are representative alike of the earlier conditions and the earlier theory of government. The educational provisions in the constitutions of Connecticut, Massachusetts, and New Hampshire, for example, are simple and indefinite. Little was put into the constitutions in this earlier time, and much was left to the legislature to deter-

mine. As time revealed the defects in the earlier theory of government, and as the suffrage was widened to include numbers of relatively unintelligent voters, we find the constitutions becoming longer and more explicit. The New York constitutions of 1778, 1822, 1846, and 1894 are examples of this. Each is longer than that preceding it, and with reference to education the constitution has changed from no mention at all to very specific commands.

The New York constitution of 1778, and the amendments of 1801, made no mention of schools or education. The constitution of 1822 merely defined the common school fund, and declared that the interest on it should be applied to the support of common schools. The constitution of 1846 declared the common school fund, the literature fund, and the United States Deposit fund to be inviolate funds, and definitely appropriated the income. The constitution of 1894 contained four sections on education instead of one. The first section laid a definite mandate on the legislature to "provide for the maintenance and support of a system of free common schools" throughout the state; the second continued the Board of Regents of the University of the State of New York, but subjected them and their work to the control of the legislature; the third reproduced the educational section of the constitution of 1846, with reference to the educational funds and their use; and the fourth forbade the use of public funds to aid sectarian or denominational schools.

As the land-grant policy of the national government began to influence and stimulate educational development, we find the people throwing more and more carefully devised safeguards around these endowments to prevent their loss or misappropriation. Ohio is the first state (1802) to show this in its constitution. In many of the earlier constitutions in the land-grant states, the article on education contained little or nothing else than such safeguards. The demand for the division of the school funds and state aid and support for parochial schools, made by the Catholics, after the new city and state school systems began to assume proportions and to exert an influence, which everywhere met with failure after 1840, resulted first in laws, and later in constitutional prohibitions, forbidding the diversion of public school funds or the appropriation of money in aid of any private, sectarian, or denominational teaching in the public schools. (See PAROCHIAL SCHOOL SYSTEM.) The first state to insert such a prohibition was New Jersey, 1844, and, since 1865, almost every state admitted to the Union or which has revised its constitution has included such a provision; Illinois, in 1870, added an elaborate and a very stringent provision prohibiting such aid or the introduction of sectarian instruction, and this has been copied by Missouri, Montana, and Idaho. One state west of the Mississippi River, three states not located

along the Atlantic seaboard, and only twelve states in all do not have such a constitutional prohibition.

With the gradual change in the conception of education, which took place quite generally in the Northern states by 1850, we find not only a more definite statement of what is to be done, but also an extension of the provisions for education by the state. Constitutions consequently became more bulky, definitions were made more exact, and duties were more explicitly laid down. This tendency became very marked in the Southern states after the Civil War, and has also been characteristic of the constitutions of the newer Western states. Almost every constitution adopted since 1865 has contained a long article on education, outlining a school system for the state. Land grants, permanent funds, executive boards and officers, taxation for education, the extent of the system, universities, normal schools, textbooks, — these and other features have been defined and explicitly provided for. Each revision of a constitution has tended toward more perfect safeguards, clearer definitions, the change of consent to command, more extensive requirements, and very clear and very positive mandates to the legislature to provide "a uniform system of free public instruction for all the children of the state." At times, advantage has been taken of the opportunity to insert requirements into a new constitution which the people, as represented in their legislatures, have not, up to that time, thought advisable or possible, but gradually the more enlightened public opinion of the state has made itself felt, the advanced provisions have proved useful, and lasting results have been attained. **CONSTRUCTIVE GEOMETRY.** — A term applied to early steps in the use of the compasses and the straight edge in effecting geometric constructions. An effort has of late been made to introduce this subject into the elementary grades, usually in the seventh and eighth school years. Several textbooks relating to the subject have appeared, and in some schools it is required. One reason for this is the fact that the art work of the schools has become less mechanical, and the drawing of geometric figures has practically ceased to be included. As a phase of manual training this work has

some value, especially if some motive is furnished, as when it is correlated with woodwork or design. When, however, it is not related to other interests of the pupil it has generally proved to be rather barren of results. At the present time considerable work of this kind is being done, by many teachers, as a preliminary to the study of demonstrative geometry, and with gratifying results. The pupil is thus introduced to the use of the tools of his subject, and is given some motive for the demonstrative work. The constructing of simple patterns of artistic form is in itself a motive that usually appeals to pupils, so that the work is pleasurable and profitable. The work also has a value because it requires the use of the same tools that are employed by the artisan in preparing his working drawings. D. E. S.

**CONTAGIOUS DISEASES.** — The aim of school hygiene is to protect a child from his foes. The most fatal of these are the diarrhea diseases of the first year of life, tuberculosis, and the contagious diseases, the so-called school diseases, of which the chief are diphtheria, scarlet fever, measles, and whooping cough. Extensive studies indicate that over ninety per cent of the deaths from these contagious diseases occur before the age of ten. Even those diseases not ordinarily considered especially serious, such as measles and whooping cough, are often fatal in these early years. In the case of measles, for example, there is great mortality in the early years of life among the children of the poorer classes, at least in European cities, where extensive investigations have been made.

Contagious disease is also a great handicap to school instruction. The great injury to school work from epidemics of disease has been pointed out recently by Secretary Martin in a report to the Massachusetts Board of Education. He writes: "In consequence of the presence of some infectious disease, chiefly diphtheria, scarlet fever, or measles, during the school year of 1906-1907, 318 schoolrooms were closed and classes dismissed. These rooms were in seventy towns. The classes included 12,122 children. The closure lasted from one day to four weeks. The waste of money involved in the cessation of work for days or weeks of more than 300 teachers and the loss of schooling suffered by the 12,000 children is a matter of no small moment; but

what we may read in the statistics of diseases and defects not numerous or serious enough to cause the closure of the school is of much greater moment." Thus here as elsewhere it is for the interest of the school to make adequate provision for the hygiene of childhood.

The health of children is determined largely by three factors: heredity, the home, and the school. While the first two of these factors cannot be controlled by the community, the third factor, the school, can be regulated in the interests of health. Thus the school, where practically all of the children of the community are brought together, offers a most favorable opportunity for controlling and averting disease, and on the other hand a most dangerous center for the spread of disease. That the school is an important factor in spreading contagious diseases, has been shown, not only by everyday experience, but also by the results of special investigation. Koroosi, for example, long ago found, during the three quarters of the year when the school was in session, 4400 cases of measles per month, but for the vacation month of August, only 780 cases; for the month of September, the first of the school year, only 639; and only 1695 for October. Taking the four quarters of the year, there were for the three months of vacation only 3054 cases, while for the first quarter of the year there were 11,865; for the second, 13,358; for the third, 13,147. In part this might be accounted for by the influence of the seasons and other factors, but further proof of the causal relation between school attendance and the spread of measles was the fact that when the time of vacation was changed—as occurred one year on account of the cholera—the period of minimal number of cases was altered correspondingly. Dr. Hodge found similar results in Worcester.

Scarlet fever, diphtheria, and whooping cough, are also spread by the school. Dr. McCollom's studies (see accompanying chart) give an interesting illustration of the incidence of diphtheria and scarlatina during the months of the year. We have, then, the following facts. These contagious diseases occur especially in the early years; the mortality is greatest in the early years; they occur most frequently during the months of the school session; the danger of infection seems to be usually greatest in the early stage of these diseases. The aim of hygiene is to postpone contagious diseases to as late an age as possible. Epidemics should be kept out of the kindergarten, at whatever cost to school work. The postponement of such diseases even to the elementary grades means that a smaller number of children will have them at an early age, and hence that there will be a smaller number of fatal cases. And the aim is also to make the time between epidemics as long as possible; for this again means that fewer young children will have the disease.

The objection may be made that postponement of an epidemic to the higher grades of the school will not save the younger children in the homes from contagion. This of course is true, but the children in the higher grades

Diphtheria, 51,621 cases. Scarlatina, 33,455 cases. Vacation, July and August, average number of cases of diphtheria, 3067. Term time, average number of cases of diphtheria, by months, 4548. Vacation, July and August, average number of cases of scarlatina, 1622. Term time, average number of cases of scarlatina, by months, 3021.

are likely to have fewer young brothers and sisters at home than children in the lower grades.

Among the means by which contagious diseases may be spread in the schools are the following: the dust of the schoolroom, common drinking cups, common towels, flies, and textbooks, slates, pencils, and the like. But the most important means is that of contact with other children who are infected. All other means seem insignificant as compared to this. In case of diphtheria the germs are often carried by healthy individuals, and such "carriers" are perhaps the most common and dangerous means of spreading the infection. While the State compels children to attend school, there is morally no option about making school conditions hygienic. And further the interests of the taxpayer as well as the demands of pedagogy and the higher claims of humanity require scientific management of school diseases.

As regards details, the regulation of contagious diseases in this country is left largely to the local authorities. The Massachusetts law is perhaps a fair sample of the state legislation. As amended by the acts of 1906 and 1907 it is as follows: "A child who has not been vaccinated shall not be admitted to a

public school except upon presentation of a certificate granted for cause stated therein, signed by a regular practicing physician, that he is not a fit subject for vaccination. A child who is a member of a household in which a person is ill with smallpox, diphtheria, scarlet fever, measles, or any other infectious or contagious disease, or of a household exposed to such contagion from another household as aforesaid, shall not attend any public school during such illness until the teacher of the school has been furnished with a certificate from the board of health of the city or town, or from the attending physician of such person, stating that danger of conveying such disease by such child has passed."

The important points as regards the period of incubation, the duration of infectiousness, and the period of isolation that should be required are given by Dr. Herrman in the following table based upon experience and practice in New York City:—

which may indicate the onset of a contagious disease. (See below.) (2) Pupils who have been excluded on account of contagious diseases. (3) Pupils who have been absent for three or more days on account of sickness of any kind.

"Pupils presenting one or more of the following symptoms may be regarded as suspicious. Marked pallor, flushing of the face, or any eruption upon the face, head or hands. Peeling of the skin, red eyes, running nose, or any discharge from the ears or nose. Swelling of the face or neck. Hoarseness, croupy cough, vomiting. Also those who complain of feeling chilly, feverish, having a sore throat or headache. Do not depend on your own diagnosis. Notify inspector if several cases of one contagious disease occur in your classroom, and if any case is not reported on the daily list.

"Symptoms which may indicate the onset of a contagious disease:—

DISEASE	INCUBATION PERIOD	INCUBATION PERIOD IN THE MAJORITY OF CASES	INCUBATION PERIOD IN THE GREATEST NUMBER	DURATION OF INFECTIOUSNESS	PERIOD OF ISOLATION		DURATION ISOLATION OF OTHER MEMBERS OF FAMILY, WHO REMOVED IMMEDIATELY
					Mild cases	Severe cases	
	Days	Days	Days		Days	Days	Days
Scarlet Fever . . .	1-8	2-4	2-4	4-8 weeks. While there is a discharge. Chiefly in early stage.	28	56	8
Measles . . . . .	8-16	10-13	11	2 weeks? Chiefly from the appearance of catarrh to eruption.	10	21	14
Diphtheria . . . . .	2-7	2-4	2-4	Until culture is negative. Usually 10-21 days.	10	28	4
Chicken Pox . . . .	13-19	14-17	15	Until the removal of the scabs, 2 weeks.	14	21	17 (Not excluded if have had.)
Whooping Cough . .	7-14	10-14	14	Usually 6 weeks from beginning of the whoop. Until no spasmodic cough.	21	56	14 (Not excluded if have had.)
Mumps . . . . .	14-28	17-20	19	2 weeks.	14	28	20 (Not excluded.)
German Measles . .	12-22	14-17	16	1 week? (Probably less.)	7	10	17 (Not excluded.)

In order to control contagious diseases, medical inspection, the services of school nurses, and the cooperation of teachers, are all required. The school physicians should visit the schools daily for the detection of contagious diseases; school nurses should follow up these cases in the home; and teachers should be trained to detect the symptoms of such diseases in their incipient stage. Dr. Herrman has formulated the following helpful list of suggestions to teachers regarding medical inspection: "Please send to the medical inspector: (1) Pupils who show any symptoms

"Scarlet fever: vomiting, flushed face. Advanced cases: peeling of the skin of the hands, or a discharge from the nose or ears. Measles: sneezing, cough, redness of the inner corner of the eye, sensitiveness to light, running of the nose. Diphtheria: sore throat or pain on swallowing, even if slight; hoarseness, a croupy cough, irritating discharge from the nose. Mumps: pain in front of the ear in eating or talking, swelling in front of and under the ear. Whooping cough: a spasmodic cough in which the child strains himself and the face becomes somewhat red. Later

there may be vomiting or a whoop. Chicken-pox: an eruption of small blisters on the face or scalp. German measles: red spots on the face. Influenza: redness of the eyes, running nose, soreness of the throat, headache, soreness of the entire body. The teacher should keep a list of the pupils absent on account of contagious disease. This should include the name, disease, date of exclusion or absence, and date of return."

The important means of controlling the contagious school diseases may be summed up as follows: (1) Daily medical inspection of all pupils. If teachers are trained to intelligent cooperation with the medical inspector, contagious diseases should be detected in their first stages by such daily inspection. (2) In order to control contagious diseases, cases must be followed into the homes, and for this purpose school nurses are necessary. (3) Not only is the exclusion of all cases of contagious diseases from the school necessary, but also all children from the same families should be excluded for a suitable period, except in the case of measles. Children of the same family who have already had measles may be permitted to attend the school, since this disease is not carried by a well person. (4) School closure in case of need should be resorted to. Whether or not school closure is an advantage depends upon the special situation and the disease in question. Usually in case of diphtheria, for example, the disease can be regulated better with competent medical inspection if the schools are continued than by closing; for in case of closure there is no guarantee on reopening the school that the children are not still bearers of the disease. In the case of measles, on the other hand, it is often an advantage to close the school some seven days after the detection of the first case, so that the second crop may occur when the children are at home. (5) Registration of all cases of contagious disease and a complete morbidity record for each pupil are necessary so that school officials and medical inspectors can always know just how much susceptible material exists. W. H. B.

**CONTENT.**—In the discussion of mental processes it is convenient to distinguish between the form of the organization of these processes and the factors which enter into the processes. The factors which go to make up any mental process are designated content. The sensory elements of experience, such as the blueness of a given surface, may be recognized as content. The form in which this surface appears, its relation to other objects, and especially its relation to processes of volition, may be distinguished from its content. In educational discussions the subject matter of a study constitutes its natural content and questions relating to subject matter very frequently depend upon very different principles from those which are involved in the discussion of organization and arrangement.

**CONTENT SUBJECTS.**—A phrase applied to those common school subjects where formal or conventional facts are relatively less important and therefore less emphasized than natural facts. Geography, elementary science, nature study, history, civics, literature, etc., have usually been regarded as content subjects. Arithmetic, reading, writing, spelling, penmanship, etc., have usually been regarded as formal subjects. The distinction is now much less used, as it is much less valid for present day teaching. Every subject may be said to have its formal and content aspects. H. S.

See COURSES OF STUDY; DUALISM; FORMAL SUBJECTS.

**CONTEXTUAL METHOD.**—A special method employed in teaching the meaning of new words in reading, language, or spelling. The child is given the word in various language settings, so that each situation will help to convey its significance, care being taken that the context is familiar. The contextual method usually supplements the "definition" or "dictionary" method, and the "objective" method. The "contextual" method is also used in testing the child's mastery of the meaning of words, the word to be tested being dictated in the context of a sentence. H. S.

**CONTINUATION EDUCATION.**—The term "Continuation School" has recently been coming into vogue to describe comprehensively any kind of training which is adapted to people

who are already at work. A detailed description of various types of continuation schools will be found under the terms: APPRENTICESHIP EDUCATION; EVENING SCHOOLS; CORRESPONDENCE SCHOOLS; INDUSTRIAL EDUCATION; YOUNG MEN'S CHRISTIAN ASSOCIATION, and UNIVERSITY EXTENSION; also, since this form of education had its origin in Germany, and has to-day its most extensive development in that country and in England, special consideration will be given to it in the articles devoted to education in those countries.

The German continuation schools are of two principal types—general and industrial. Both had their beginnings many centuries ago, in the attempts to provide more adequate instruction in Christian doctrine and in industrial subjects for young people. Since 1870 both types have developed rapidly, and the general trend has been, in view of the universal prevalence of compulsory general education, to make them reinforce industrial training. In 1891 appeared an imperial decree, making it compulsory upon employers and parents to send their children to continuation schools wherever these might be established by the State. Only rarely does the imperial government of Germany attempt to regulate education, and naturally this decree has attracted widespread attention; as a result of it, attendance on continuation schools has become obligatory in many of the smaller states of Germany, and in parts of Prussia. The tendency is to substitute, for continuation work on Sunday and evenings, six or eight hours per week of the day period. In the industrial schools there is, as a rule, no concrete or practical teaching, the studies being mainly of a technical character and connecting rather intimately with the practical work pursued by the apprentice during the day.

In England continuation work has found its development in a very extensive system of evening schools (*q.v.*) a considerable number of which have been designed primarily to give a further industrial education of young persons already employed. The national government assists these evening schools by generous grants, but nowhere is attendance obligatory. In some cities the attempt is made to have the same students devote part of their time to technical studies, part to cultural pursuits, and part to physical drill and recreation. The total attendance in the continuation schools of England is very large, but many of the conditions are unsatisfactory. Attendance in the evening, when the youths are tired, fails to provide the requisite energy and alertness for the learning, especially of the different technical subjects. Teachers cannot be trained specially for this work, and satisfactory supervision of it is yet difficult.

In America an extensive system of public evening school education is to be found in the larger cities; relatively little of it is of an industrial character as yet, but the tendency is to increase the opportunities for technical training.

In some cities continuation education in English for foreigners has attained considerable proportions. In a few cities a distinctive type of cultural work, corresponding to that found in secondary schools, has been developed, but in few cases have the evening high schools yet succeeded in covering all of a regular high school course. A great variety of continuation work is to be found in American cities under religious and philanthropic auspices; this will be discussed under the topics suggested above.

The present trend of public opinion in all countries having continuation work is that so much of such work as presupposes hard work and a state of mental alertness (such as technical, language, and other studies pursued for the purposes of distinct achievement) should be placed in day, rather than evening hours, and that the evening schools should be reserved for work more distinctly recreative in character, or cultural, in the sense that its effects can be realized without too great exertion on the part of the student; in other words, lectures, music, drama, and general information courses can be given in the evening, as well as swimming, gymnastics, military drill, dancing, and games designed for physical development; but drawing, mathematics, science, economics, and the other studies designed to promote efficiency for industrial purposes, or other studies like history, literature, and science, taken for cultural purposes, but with the aim of securing a diploma, should be reserved to day hours. This generalization, of course, applies primarily to youths under seventeen or eighteen years of age who are still plastic in bodily development, and whose need of rest is considerable. For people beyond these ages, evening schools of various types may continue to provide the necessary means of further training or culture. It will be noted that the placing of continuation work during day hours will make it possible to develop a special teaching force for it, inasmuch as it would be arranged that the pupils should appear in relays, the same teacher dealing with successive groups; in this way, a specialized teaching force could be developed for the handling of any special phase of continuation work.

The above-mentioned tendencies in continuation work will require the coöperation of employers, and will probably demand compulsory legislation. The logic of the situation is clear to students of education, and it is probably true that Germany, in this respect, is simply anticipating a development that will soon become prevalent wherever continuation work is found.

**CONTRACTILITY.** — The power of protoplasm, or of living cells, to undergo transformations in form by contraction or expansion in response to incident forces is known as contractility. The muscle cell possesses this power in a high degree of development, and it is by virtue of the contractility of muscles that the higher organism moves. Amœboid movements, ciliary movements, and the movements (contractile or expansile) of muscle cells are varied expressions of the property of contractility.

**CONTRAST.** — When two mental processes are of the same general type but fundamentally different in quality, attention is drawn to both mental processes through this fundamental difference. The difference itself is described as the contrast and the value of studying contrast in psychology and in education depends upon the fact that attention can be aroused through contrast. Thus two colors which differ radically from each other in quality, as, for example, two complementary colors, exhibit a sharp contrast. A transition from a high shrill tone to a low dull tone gives a contrast which will draw attention to both of the tones. Changes in subject matter and in forms of presenting subject matter constitute contrasts which are advantageous because of the attention which they arouse. C. H. J.

See ANALOGY; ASSOCIATION.

**CONTROL.** — The conception of control, borrowed from biological considerations, is destined to an important rôle in the philosophy of education. Under the caption of adaptation (*q.v.*) it has been pointed out that active adaptation involves a capacity to modify the environment or medium of life in the interest of the purposes of the organism. Inanimate things manifest no power to subject the environment to the maintenance of their own individual character; while the higher the type of life the more highly developed is this function of control. Every physiological organ, every instinct, every habit and every so-called mental faculty is to be regarded as a more or less specialized instrumentality of control of some corresponding phase of the physical and social environment. Accordingly the principle acquires significant application to education in all matters of psychophysical and also logical training. The useful habits of action and of

thought which pupils are to acquire are to be conceived as so many modes of control of conditions for the sake of ends. These habits — even those of a more theoretical character — represent so many efficiencies, not so many self-justifying ends. (See PRAGMATISM.)

Looked at as methods of control, our mental powers may be classified as direct and indirect agencies of subordinating the environment to the ends of life. Seeing, hearing, handling, touching, smelling and tasting, locomotion, reaching, etc., *i.e.* all the sensible and motor activities, represent direct means of controlling the environment, touch being the most immediate mode, and the higher or intellectual senses, seeing or hearing, the more mediate modes. Thinking and its instrument, language, represent, on the other hand, the indirect forms of control. Hence they are not directed or discharged at once upon the external world of nature and society, but have to do with elaborating plans and methods by which the direct (the sensorimotor) organs may better perform their functions. When it is said, for example, that an idea is inherently a "plan of action," it is meant that an idea is such an interpretation of sensory stimuli as enables them to evoke more comprehensive and significant types of action and values of objects than they would excite if left to themselves. In this way modern functional logic gets beyond the onesidedness of both historic empiricism and rationalism. Recognizing with empiricism the part played by sensation in building up the higher forms of mental life, it still holds that an idea is never a mere composite or associated aggregate of sensations, since it always involves selective arrangement of sensations with reference to a future more complete mode of activity. In like fashion, functional logic recognizes with rationalism the constructive and organized rôle of thoughts (which in the case of some ideas may be sufficiently commanding to entitle them to be named "categories" of experience), but instead of regarding this power as an absolute and independent, or *a priori*, possession of thought, it is regarded as arising out of the need of better control of the sensorimotor organs, and as requiring to be experimentally tested. All genuine thoughts are *a priori*, but only in the sense that they anticipate and endeavor to regulate some future experience, *i.e.* they are plans of action. Their degree of failure or success in the work of anticipation and control nullifies or corroborates them and leads to further revision and perfecting. So far as control becomes perfect, the thought ceases to be thought and becomes an automatic habit; so far as it lapses, under changed conditions into an inadequate mode of control of a future experience, reflection is again set up. J. D.

See CONFLICT.

**CONTROL (PSYCHOLOGICAL).** — This term has come into technical use to indicate a

phase of development which is superior to habit. It refers to the fact that after a habit has been formed its use in a given situation depends upon the intelligent direction of this habit toward clearly recognized ends. Thus one may have a certain habit of facial expression. If in addition to the habit he is able to control the facial expression, he may employ the expression at such times as shall be advantageous for purposes of social communication. Lack of control signifies an inability to utilize a habit intelligently. Thus one is not always able to control his tendencies toward such a form of expression as yawning or sneezing. The development of control in connection with the training of habits is of the highest importance. The mere training of an automatic movement may be of relatively little value from an educational point of view, but the development of control is of the highest significance. C. H. J.

See ACTIVITY; ATTENTION; HABIT.

**CONVENT SCHOOLS.** — The term "convent," originally referred to the local organization or community as distinguished from the house or the order; by popular usage, however, "convent" refers to such a home or order for women, while "monastery" in a similar way refers to those for men. Convent schools owe their origin to the monastic settlements of women which began to spring up in the fourth century, but the education of young women for the world, which in our day has called into existence so many teaching communities, formed no part of the original purpose of the early settlements of women that looked to St. Basil and St. Augustine (*q.v.*) for direction. The impulse which peopled the desert of Egypt with hermits moved many Christian women in the upper ranks of Roman society to abandon the luxury of the world and to seek in the seclusion of the cloister an opportunity to put into daily practice the evangelical counsels and to seek to realize in their lives the lofty ideals of Christian virtue. The educational work carried on by these early communities was directed chiefly to the preparation of their own members for the worthy discharge of the duties of the monastic life.

With the invasion of the barbarian tribes of the north, monasticism for women entered upon a new phase, and the convent school took on a different character. In the early days of the invasion the men among the upper classes of the Germans and Franks evinced little inclination for the monastic life. Many tempting careers were open to them in the Roman world. Moreover, their time was largely occupied in petty warfare. But with the women of the upper classes the case was very different. Accustomed for generations to wield authority among their own people, and possessed of no less restless energy than their brothers, they found all avenues in the Roman world closed to them. Under those circumstances many of them left the court to seek in the cloister protection from the

turbulence of the times and to pursue the Roman culture which still survived in the convents. These royal ladies, however, were not characterized by meekness and humility. They not infrequently adopted the religious life as a profession. They took with them a domineering character, a quick determination, and a clear-sighted appreciation of the possibilities which the monastic life opened up to them. Many of them, however, were transformed by the religious spirit and the discipline of the convent, and rose to great heights of sanctity. From the sixth to the thirteenth century many monasteries for women were founded by members of the royal family. The abbesses of these houses were not infrequently the wives or daughters of reigning princes. While living in the convent, these ladies kept in touch with worldly affairs and took a large part in shaping the nascent nationalities and in developing the civilization of western Europe. These convents were enriched by grants of land from their royal patrons, and they obtained many privileges from the Roman pontiffs. They usually sided with the Pope, and were frequently involved in contentions with local ecclesiastical authorities. This phase of convent life attained its most characteristic development in Saxony. The abbesses of the Saxon monasteries were usually members of the royal family, and held a place of authority second to no woman in the land. They held their abbeys from the King, which precluded a dependent relation on lords temporal or spiritual. The Abbess of Gandersheim, one of the most famous of these convents, held rights of overlordship over many miles of the surrounding country. She exercised the right of ban. She issued summons to her dependents when war had been declared, and sent her contingent of armed knights into the field. She issued summons to attend her court, and was in turn summoned to the Imperial Diet. The Abbesses of Quedlinburg and Gandersheim held the right of striking coin in the reign of Otto I. During the minority of Otto III, his mother, together with his aunt Mathilde, Abbess of Quedlinburg, practically ruled the empire, and during a prolonged visit of the Emperor in Rome in 997 the management of affairs was given to the Abbess Mathilde, who has often been praised for the determined measures which she took to oppose the invading Wends. In 999, on her own authority, she summoned a diet at Dornburg. A similar state of affairs obtained in other parts of Europe. In England the abbesses of many monasteries ranked with barons.

The educational activity of the convents during this period may be seen from many documents which have come down to us. Cæsarius, Bishop of Arles, 501-573, wrote a rule for a community of nuns which he established in his diocese under the government of his sister Cæsaria. The nuns were forbidden to take children under the age of six or seven, and were cautioned against readily accepting the daughters

of nobles or lowly born girls to be brought up and educated in the convent. Considerable time was to be devoted to the study of music, with a view to preparing the nuns to take part in the chants and choir singing in connection with the religious exercises of the convent. A training in reading and writing was prescribed for all the members of the community. Spinning and weaving woolen fabrics from which the nuns made their own garments constituted a part of their work, but their highest efforts in weaving and in artistic needlework were devoted to the making of church hangings and vestments. This rule reveals a transitional phase in the educational work of the convent between that of the early monasteries, which was exclusively for the nuns, and the later convents, which became the home of learning and the recognized schools for the daughters of the upper classes. The educational side of convent life perhaps reached its highest development in Saxony. Many of the children who went to these Saxon convents on completing their education joined the community, while others returned to the world to be married. Widows often returned to the convent to spend their declining years in the home of their childhood. The convents of Herford, Gandersheim, Essen, and Quedlinburg gave a domestic and intellectual training of a very high order. The term "college" in its modern sense has often been applied to these institutions, and rightly so, for they not only gave the best education of the times to the girls who assembled there, but they were the permanent homes of many learned women who devoted their lives to literature and the fine arts. A convent school education in those days conferred distinction on all those who were fortunate enough to receive it.

Bede (*q.v.*) writing of Anglo-Saxon England in the seventh century, says: "Many were wont for the sake of the monastic mode of life to go from Britain to the monasteries of France and Gaul. They also sent their daughters to the same to be instructed." In Anglo-Saxon England the first monastery for women was probably that founded by Eanswith, daughter of King Eadbald, in 630. The convent of Lining was founded by Queen Ethelburg about the middle of the seventh century, and that of Sheppey a few years later by Queen Sexburg. From a charter of privileges granted by King Wiltred and Queen Werburg between 696 and 716, we learn that there were at that time in the province of Kent alone five monasteries governed by lady-abbesses. In Northumbria the Abbess Hild founded a monastery at Hartlepool about the year 617 and another at Whitby a few years later. These monasteries were richly endowed by Oswin, who sent his daughter Elfred to Hild to be educated by her and to become a member of her community. Hild did not confine her educational endeavors to women. Bede, after speaking in the highest terms of the religious discipline maintained at

Whitby under Hild, says: "Moreover, her prudence was so great that not only did ordinary persons, but sometimes even kings and princes seek and receive counsel of her in their necessities. She made those who were under her direction give so much time to the reading of the sacred Scriptures and exercise themselves so much in works of righteousness that very many, it appears, could readily be found there who could worthily enter upon the ecclesiastical grade, that is, the service of the altar." Five of her pupils did, in fact, become bishops. Shortly after this time many monasteries for women sprang up in all parts of England. From this time to the middle of the thirteenth century the educational activity of the convents ran parallel to that which obtained in similar institutions on the continent.

Many of the women educated in the convents of western Europe between the sixth and the thirteenth century gave abundant evidence of the thorough training which they had received. Among many others may be mentioned the nun Roswitha, who, in the latter half of the tenth century, attained enduring fame as a poetess and historian. Erbert says of her (*Allgemeine Geschichte der Litteratur des Abendlandes*, 1887): "This fruitful poetic talent which lacks not the inspiration and the courage of genius to enter upon new ground, evinces how the Saxon element was chosen to guide the German nation in the domain of art." Roswitha wrote metrical legends for the edification of the nuns; she wrote contemporary history in metrical form; and composed seven Latin dramas written in the style of Terrence. As an historian, Giesbrecht classes her with Wittikind and Routger, but as a writer of Latin drama in the Middle Ages she stands alone. Herrad, Abbess of Hohenburg in Alsace, gives a glimpse into the artistic activities of the convents of the twelfth century. Few illuminated manuscripts have acquired a fame so well deserved as her *Hortus Deliciarum*, in which she attempted to embody in an encyclopedic work, both in writing and in pictures, the knowledge of her times. The text of this work perished with the library of Strassburg in 1870, but a collection of some 200 pictures copied from it has been preserved. Hildegard of Bingen, 1098-1178, and Elizabeth of Schönau, 1129-1165, are chiefly known through their political writings, which show us the active part that nuns continued to take at this late date in the affairs of the nation. Their writings possess another interest for the student of convent school education, exhibiting as they do the growth of mysticism, which was soon to play so large a rôle in the decline of the educational activities of the nuns.

The convent schools of the Middle Ages reached their highest development about the middle of the thirteenth century, at which time many influences conspired to bring about their gradual decline. From the sixth to the thirteenth century the convents afforded the

women of the upper classes a secure shelter from the turbulence of the times. During the Crusades they offered the only safe refuge for the wives and daughters of the knights who were embarking on perilous enterprises with large chances of never returning to their families. With the more settled conditions of the thirteenth century these motives for entering the convent ceased. From this time on an ever-increasing number of the women who entered the convent did so in pursuit of purely religious ideas. The reaction against the rationalism of Abelard (*q.v.*) and the heresies of a somewhat later date resulted in the rapid development of mysticism in the convents. This impulse, which contributed so powerfully to the development of art in all its forms, gradually narrowed the educational horizon of the convent. The rise of the mendicant orders and the religious reforms of the times all tended to bring about a greater seclusion of the nuns and to limit their intercourse with the outer world. The passing of the feudal system and the growth of the townships gave a wide scope to the development of art outside the monastery which heretofore had been its only home. The printing press removed the necessity of copying manuscripts and thus cut off a hitherto powerful stimulus to the educational activity of the convent. In the meanwhile the universities drew to themselves the intellectual men from the world and from the various ranks of the clergy and the religious orders of men. The nuns and women in general were practically excluded from the intellectual life of the university. It is not a matter of surprise, therefore, that the standard of education in the convents gradually deteriorated. It should be remembered, however, that the convents of this period, though not holding their own with the universities, offered the only available schools for women. This phase of the convent schools terminates with the suppression of the convents in England and in Northern Europe in the troublous times following the Protestant Reformation. Convent schools, however, did not cease to exist in Catholic countries. The daughters of English Catholic families in the early days of the Reformation received their education in convent schools on the Continent. During the seventeenth and eighteenth centuries many daughters of non-Catholic families were sent to convent schools where their parents sought to shelter them from the loose manners of the times. This was particularly true in the court circles of France.

The last century witnessed a very rapid development of the convent school. With the spread of popular education, a multitude of teaching communities were called into existence for the express purpose of educating girls. In England the pioneer among the post-Reformation convent schools was Bar Convent at York, founded by Mary Ward in 1688 for the education of English girls of the upper class. For

more than a century the penal laws prevented these ladies from assuming religious names or the religious garb. From the year 1790, in which the institution assumed the outward appearance of a convent, the community has grown very rapidly. At the present time it conducts 180 schools in England. A multitude of convent schools grew up in England during the latter half of the nineteenth century. Many of the secondary schools conducted by the various teaching sisterhoods are recognized by the Board of Education and receive support from the State, but many of them, while recognized by the Board of Education, refuse State aid, and they thus retain a greater measure of independence both as regards the admission of pupils and in the regulation of their courses of study. The central purpose of convent school education is the imparting of a thorough religious training, but at the same time it keeps fully abreast with the non-Catholic school in scholastic efficiency. Government inspectors and examiners have frequently borne willing testimony to the excellent scholastic training as well as to the religious atmosphere of the convent schools. Apart from the multitude of parochial schools (*q.v.*) conducted by the teaching sisterhoods, there are at present something over two hundred academies or secondary schools in England conducted by the members of some sixty different teaching communities. There are two training colleges devoted exclusively to the preparation of teachers for secondary schools. The largest of these is St. Mary's Hall, Liverpool, conducted by the Sisters of Notre Dame of Namur; the other at Cavendish Square, London, conducted by the Sisters of the Holy Child Jesus. The sisters of the various communities who teach in the primary Catholic schools of the kingdom for the most part receive their professional training in one of the six recognized Catholic training colleges for primary teachers. The first of these was established in Liverpool by the Sisters of Notre Dame, two of these training schools are conducted by the Sisters of the Sacred Heart, one by the nuns of La Sainte Union, another by the Faithful Companions, and the sixth by the Sisters of Mercy. A certificate of graduation from one of these schools, together with two years' successful teaching in any one school of the Kingdom, entitles the candidate to a certificate from the Board of Education. The convent schools of Ireland and Scotland are on practically the same plane as those of England.

The first convent school established within the present limits of the United States was that founded in New Orleans by the Ursulines from France in the year 1727. The French government subsidized this school. From a copy of the rule of this community, published in Paris in 1705, it appears that: "The Ursuline order has been instituted, not only for the salvation and perfection of its members, but also in order

that these may help and serve their neighbor by the instruction of young girls, whom they must labor to bring up in the fear and love of God, leading them in the way of salvation, teaching them every social and Christian virtue, and preparing them to be a source of edification to others by the practice of these virtues." Concerning the preparation of the teachers, the same rule says: "The principal end of the Ursuline's education being to give a good and solid education to young persons, according to their condition, all the teaching religious ought to prepare themselves in the sciences and arts so as to be always capable of meeting the exigencies and to be thoroughly master of all they may be called upon to teach." The first curriculum of this school in New Orleans included reading, writing, arithmetic, Christian doctrine, and industrial training. The Ursulines employed pupil teachers called "dizainieres." These were selected from among the brightest and best-behaved girls. Their office was to assist the teachers in class work and in the maintenance of discipline. Each pupil teacher was assigned a group of eight or ten children. In this respect the convent school anticipated Lancaster (*q.v.*) by almost a century. The Ursulines also employed special teachers for handwriting, arithmetic, and industrial training. The system of training here outlined is practically that adopted by the various teaching communities who were brought to this country from Europe during the eighteenth century or were founded here with a view to meeting the special needs of American girls. The novitiates of these orders constituted the first training schools for teachers in the United States, some of them antedating by twenty years the first public normal school. At the present time there are in the United States more than a hundred distinct teaching orders of women, and if the independent foundations of some of these orders, such as the Visitandines, Ursulines, Dominicans, Franciscans, Sisters of Mercy, and Sisters of Charity be counted, the number reaches some 300. The official directory, January, 1910, gives the number of academies conducted by sisters in the United States as 709. Among the pupils of these schools there are a great many non-Catholic girls. The course given in the secular branches, in most instances, is equivalent to that given in a first-class high school, with the addition of religious instruction and a training in domestic occupations. Within the last few years a number of these communities have established colleges which maintain a high academic standard. In the novitiate schools of the various teaching orders the teachers for both the parochial schools and the academies receive their professional training.

In its general purpose the convent school expresses the idea that beyond a certain age girls should be educated apart from boys. This is the traditional practice of the Catholic Church,

and it is in keeping with the principle that education must conform to natural requirements. Neither the arguments in favor of coeducation nor the results which it has produced have so far outweighed the reasons on which the convent school is based. The same reasons, of course, are emphasized in those non-Catholic academics and colleges which provide separate education for girls, however closely they follow the courses and methods of instruction which are pursued in colleges for men. As a special feature, the convent school implies that the student shall reside, during the academic year, within the institution, and shall observe the rules which it prescribes. It is considered advantageous that girls should live under a discipline adapted to their mental and physical needs, with a well-defined series of occupations and a proper distribution of time that secures regular hours for study and recreation. It is, in particular, desirable that the student be withdrawn from distracting influences and trained in those habits of concentration which are essential to intellectual work. Still greater importance is attached to the development of those virtues which form the moral strength and beauty of Christian womanhood, and the best preparation for the duties incumbent on wife and mother. While residence in the convent is a safeguard, the example of teachers whose lives are consecrated to God's service acts as a constant stimulus to moral endeavor. It is chiefly, however, through the knowledge of religious truth which permeates the entire course of instruction and through the regular practice of religious duties that the convent school performs its educational function. So far as it is successful in this respect, it imparts to its students a delicacy of feeling and a firmness in right-doing which, along with mental culture, are the purest sources of woman's influence for good in the home and in the social sphere.

**CONVENTIONS, SCHOOL BOARD.** — A term employed with increasing frequency in recent years to signify the periodical (usually annual) gatherings of the members and officers of local boards of education for conference and instruction upon matters pertaining to the general administration, welfare, and progress of public schools. In its narrower application the term has lately come to be restricted to those meetings for the organization and the holding of which special legal provisions have been made in several states. Up to the present time nine states, Idaho (1909), Michigan (1909), Minnesota (1903), North Dakota (1903), Oregon (1907), Pennsylvania (1903), South Dakota (1901), Washington (1907), and Wisconsin (1905), authorize the county superintendent of schools, or corresponding officer, to hold at some central point an annual meeting of the members and officers of district and other school boards in the county. While in some instances attendance is voluntary, the tendency has been to require each board to send at least one representative. The more significant of these laws contain provisions for a per diem compensation and mileage. The meetings usually continue for one or two days, and are devoted to general discussion of matters and problems of local moment.

The high degree of decentralization characteristic of the administrative control of elementary and secondary public education in the majority of American states has caused the local boards of laymen to become determining and dominating factors. This is especially the case in the rural sections of those Western and Northern states in which the district, having a board of from three to five members, is the unit for educational administration. Under such circumstances the total number of lay school officials becomes abnormally large and frequently exceeds the total number of teachers in the state. In the absence of continuous and expert professional supervision the efficiency of the school is largely a matter of the efficiency of the lay board. These school board conventions become, as it were, agencies for the unification of educational effort and schools of instruction for laymen charged with the powers and responsibilities of local educational administration. The county superintendent of schools has generally the immediate oversight of the convention, while the state superintendent of public instruction exercises a general influence in directing subjects for discussion. Experience has shown that these conventions have resulted in a broader interest, a sounder knowledge of

educational issues, and a higher sense of official responsibility on the part of laymen.

In addition to these conventions, voluntary independent associations of the members of local boards of school control, organized, and meeting at stated intervals, for the purposes of stimulating discussion and of promoting efficiency in the lay administration of education, are not uncommon. In a number of instances state associations of this character exist (*e.g.* Ohio, Maryland); in others, county or district associations have been formed (*e.g.* New Jersey). Not infrequently these associations are affiliated with, or are integral parts of, state or local teachers' associations. E. C. E.

ELLIOTT, E. C. A Type of Positive Educational Reform. *Educ. Rev.*, Vol. 33, pp. 344-355.

**CONVERGENCE.** — That position of the two lines of regard (*q.v.*) of the eyes in which they meet in a single point in front of the eyes. Also applied to the sensory-motor processes by which such a position is attained. The point referred to is called the fixation point. (See **FIXATION**.) Movements of the eyes from a more distant to a nearer fixation point involve an increase, and, from a nearer to a more distant point, a decrease in convergence. Convergent eye movements (which are symmetrical movements) may occur along with asymmetrical binocular movements, in order to fixate, without movement of the head, points in peripheral portions of the field of regard (*q.v.*). R. P. A.

Reference: —

SCHAEFER, E. A. *Textbook of Physiology*, Vol. II, pp. 1131-1132. (Edinburgh, 1898-1900.)

**CONVERGENT ASSOCIATION.** — Whenever a system of ideas is so organized that they tend to bring the mind back to a single central principle or idea, all of the associations are said to converge upon this one idea, and the whole system is said to constitute a system of convergent associations. The principles of correlation (*q.v.*) and concentration (*q.v.*) of studies emphasize in a practical way the importance of these convergent associations as distinguished from divergent associations.

See **ANALOGY**; **ASSOCIATION**.

**CONVERSATIONAL METHOD.** — A method of teaching through conversation: (1) An oral method, representing a reaction against the previous method of conducting class exercises by means of formal questions and answers in favor of a more natural and sociable manner of teaching. In this sense it is much used in the teaching of the so-called content subjects (*q.v.*), such as nature study, geography, etc., the conversational lesson being a means of reporting, comparing, and organizing the results of observation and readings. Conversational lessons are frequently utilized in the so-called formal

subjects, such as composition, beginning reading, spelling, as a means of giving a content basis preliminary to developing the technical or formal elements in writing, reading, and spelling. (2) This method as applied to the teaching of foreign languages implies an effort to teach a foreign language nearer to the manner of acquiring the vernacular. The spoken language, mainly through conversation about familiar objects, is made the basis of reading. In other cases such conversational work is a mere supplement to grammatical work and reading. H. S.

See COMPOSITION; ENGLISH LANGUAGE, TEACHING OF; MODERN LANGUAGES, TEACHING OF.

**CONVERSE COLLEGE, SPARTANBURG, S.C.** — An institution for the higher education of women, opened in 1890. Collegiate, musical, and fine arts departments are maintained. Students are admitted to the college courses which lead to degrees either by certificate from an accredited high school or by examination. There is a faculty of twenty-four.

**CONVEYANCE OF CHILDREN TO SCHOOL.** — See CONSOLIDATION OF SCHOOLS.

**CONVOCAATION.** — An assembly at the English universities with various powers of legislation and recommendation in matters concerning the universities. At Oxford and Durham universities convocation consists of all officials and all graduates holding degrees of doctor and master in any faculty and of Bachelors of Divinity, who have kept their names on the college books, that is, have paid the statutory fees. The convocations at these universities have power to legislate and must be consulted whenever decrees or statutes are to be revoked or altered. At Cambridge University the composition and duties of the Senate are similar to those of the convocations at Oxford and Durham. At the newer universities convocation consists of the officers of the universities and registered graduates who have paid the necessary fees; usually graduates are not eligible until three years after taking their first degree. Convocations here have only the power of making recommendations and expressing opinions on any matter affecting the university to the smaller legislative council or senate or court, and of electing the chancellor and representatives to the legislative assemblies. While the latter type of convocation is a medium for retaining the interest of graduates in the progress and welfare of their *alma mater*, the danger is avoided of submitting legislation to a large and cumbersome body of members who are often out of touch with the changing needs of the modern university and who more often than not exercise their votes in the interests of reaction, as at Oxford and Cambridge. At the same time the legislative body, whatever its title may be in

the different universities, is small and has the benefit of the recommendations of the graduate body, which it may reject or accept, as the case demands.

See CAMBRIDGE; OXFORD; UNIVERSITIES.

**CONVULSION OR FIT.** — An involuntary hyperkinetic or increased motility condition closely associated in a physiological way with spasms and with tremors. When the movements are of parts of members, or of independent small groups of muscles, or of parts of muscles, and not forcible, they are called tremors; when a muscle or group of muscles contracts unconsciously and forcibly, the condition is called a spasm; and when the spasms are repeated and are widespread, they are called a convulsion. In a convulsion, the movements may be long-continued contractions, in which case the convulsion is called tonic; or there may be alternate contractions and relaxations, in which case the convulsion is called clonic. Many convulsions are of a mixed character, and in some there are found distinct clonic and tonic phases.

Convulsions are found as a symptom in a variety of nervous diseases; they may result from the action of certain poisons or from other kinds of irritation to the nervous system. Uremia, anemia of the cerebrum, cerebral hemorrhage, and the excitation of the cerebral cortex by a spicule of bone are very different causes, but all produce convulsions of a similar nature, and of a type difficult or impossible to distinguish from those produced by the action of strychnine, or of absinthie, and resembling those found in epilepsy (*q.v.*). Any long-continued irritation of the nervous system may produce convulsions. We may note as examples, on the peripheral side, the pain irritation from erupting teeth and the long-continued gastro-intestinal disturbances in children; in the spinal cord, poisons like strychnine; and in the cerebrum, drugs like cocaine and carbolic acid, and autotoxins formed in certain diseases, *e.g.* tetanus and hydrophobia.

Convulsions of cerebral origin are often preceded by a peculiar sensation, vague feeling, or bodily warning, called an *aura*. This accompaniment of convulsion is frequently found in the so-called idiopathic epilepsies, and is often sufficiently antecedent to the convulsion to enable the sufferer to seek a suitable place in which he may lie down. At times convulsions are accompanied by partial or total loss of consciousness, by absence of voluntary control, and by loss of control of certain reflexes, such as those of the bladder and rectum. Certain convulsions are known to start in a group of muscles and to extend first to those most closely related, and finally to those all over the body. In others, the whole body appears to be thrown into movement at once. These characteristics are important to note, that the physician may be able to make a proper diag-

nosis and to analyze the causative factors. The movements of the jaws, tongue, and cheeks churn the saliva in the mouth and frequently produce a frothing, which, if the tongue has been bitten, is stained with blood. The special type of convulsion due to cold, or to the feeling of cold, is given the name "chill." This kind of convulsion is normally found in patients with malaria, who feel cold, but who have a distinct rise in temperature (fever). S. I. F.

**COOKERY.** — See DOMESTIC SCIENCE; HOUSEHOLD ARTS.

**COOPER COLLEGE, STERLING, KAN.**

— Founded in 1881, under the auspices of the Synod of Kansas of the United Presbyterian Church. It is a coeducational institution, maintaining preparatory, collegiate, normal, and musical and arts departments. Students are admitted to the college by either examination or graduation from an accredited high school. The normal course leads to the state certificate. There is a faculty of eighteen.

**COOPER, MYLES** (1735-1785). — Educator; born in England and educated at the University of Oxford. For two years he was a fellow in Queen's College. He accepted a professorship in Columbia College (then King's) in 1762, and a year later was made president. In 1774, he was accused of the authorship of a pamphlet which contained outspoken loyalist sentiments, and he fled to England to escape mob violence. He was subsequently a preacher at Oxford. W. S. M.

**COOPER-POUCHER, MATILDA S.** (1839-1900). — A teacher for forty-four years in the Oswego normal school; was educated in the public schools of New York State, and at the Albany normal school. She was associated with Dr. Sheldon in the Oswego normal school from its inception to the time of her death. W. S. M.

**COOPER, THOMAS** (1759-1839). — Educator, graduated from the University of Oxford (England), 1781. He came to America with Joseph Priestley (*q.v.*) in 1794, and was professor of chemistry at Dickinson College and the University of Pennsylvania. He subsequently became president of the University of South Carolina. Author of textbooks on chemistry and political economy. W. S. M.

**COOPER UNION.** — An educational institution, established in 1859, for the advancement of science and art, by Peter Cooper, a foremost citizen, philanthropist, and merchant of New York. From the first, the most important work of the institution has been performed through its evening classes, in which 142,155 students were enrolled during the first fifty years of its existence. The evening courses at present represented in the institution include a five-year course in general science, a five-year course in chemistry, a four-year course in electrical engineering, and courses of shorter length in mechanical, architectural, and freehand drawing, decorative design, and clay modeling. The so-called course in general science, which has been in operation since 1864, is a distinctive feature of the institution. This course, which draws ambitious and strong-purposed young men from the drafting rooms, engineering offices, and shops of the city, has gradually become a course in the fundamentals of mechanical and civil engineering, embracing instruction in mathematics, science, drawing, and technology, and requiring attendance for four or five evenings a week for a period of five years. The enrollment in the fifth year of this course is about 50 per cent of that in the first year. During the fifty years of its existence, it has graduated some 793 students, many of whom now fill positions of much responsibility in various lines of engineering, business, and manufacture. A Day Technical School has been maintained since 1900. The four-year course embraces instruction in mathematics, science, and technology, and affords training in civil, mechanical, and electrical engineering. The Woman's Art School for instruction in the arts of design, has been a feature of the institution since its foundation. In addition, day courses in stenography and telegraphy are maintained. The enrollment for the year 1909-1910 was 2524 in the evening courses, and 626 in the day courses. A free public library, especially strong in technical and art works, is maintained by the Union, as well as a museum of decorative art, containing very valuable and comprehensive collections. All instruction at Cooper Union is free. The budget for the year ending July 1, 1910, was \$166,395. The institution is mainly supported by endowment funds amounting to \$2,797,727.67. Charles R. Richards, B.S., is director. C. R. R.

**COÖPERATIVE HOLIDAYS ASSOCIATION, ENGLAND.** — An association "which offers a cheap and healthy holiday on simple lines combining all physical and intellectual enjoyment." The movement is distinguished from the Chautauqua Movement (*q.v.*) in America by the fact that it aims to reach those who work in the mills, in the shops and stores, and that more emphasis is placed on healthy physical recreation than upon intellectual improvement. It arose out of a rambling club

organized in 1887 by Mr. T. A. Leonard, the present secretary of the Association, and at that time pastor of the Congregational church at Colne, Lancashire. The chief aim then was to teach the working classes of Lancashire how to spend their leisure time. Out of the rambles grew a week-end holiday in the Lake District, spent in healthy walking amid some of the finest scenery that England has to offer, with intervals devoted to inspiring addresses—a strange contrast to the hustling, roystering crowds herded together in lodging houses amid the dust and noise of “towns by the sea.” Gradually longer holidays were taken; women were admitted as well as men; members of all denominations were welcomed. In 1896 the sphere of work was further extended by affiliation with the National Home Reading Union (*q.v.*). In 1897, under the influence of Dr. Paton of Nottingham, the pioneer in the N.H. R.U. movement, a company was formed, under the title of the Coöperative Holiday Association; to rent, and later to purchase, guesthouses. The dividend is limited to 5 per cent. Thirteen centers are now maintained in Great Britain and Ireland, France, Germany, and Switzerland, some open only in summer and autumn, others throughout the year. A large part of the work of management is voluntary. At each center there are a secretary, hostesses, and lecturers, and a paid manageress who looks after the culinary and service departments. The problem of domestic help has been solved in two ways: in some centers the guests perform their share of service; in others helpers are engaged at fair wages, and after their work is done they mingle with the other guests. At the center the greater part of the day is spent in rambles under guidance of men who have a strong interest in nature study and natural history and understand the beauties of nature. The evenings are devoted to lectures, music, or games. At some centers short summer schools of one or two weeks' duration are maintained; last year series of lectures were given in geology and music at two centers. Simplicity, cheapness, self-help, and comradeship are among the aims of the Association. The great end to be attained is to teach the town worker how to spend his holidays rationally to the benefit of his mind and body. For the present, in spite of limited accommodations, the Association succeeds in reaching about 10,000 men and women each year. An outcome of the Association has been the formation of rambling clubs throughout the country. A magazine, *Comradeship*, is issued monthly as the organ of the Association, in connection with the National Home Reading Union. The central offices are in Manchester.

**COÖRDINATION, PSYCHOLOGICAL.**—The numerous muscles of the arm must contract in a certain sequence and with graded intensities, if the arm is to move through space and reach its goal with precision. That the

trained arm is capable of movement with precision is due to the distribution of motor impulses properly timed and graded in intensity. The nerve centers must develop inner connections in order to send out these motor impulses. When such inner connections are developed, the centers are said to be coördinating centers, and the muscles are said to be coördinated. An example of muscular coördination appears in the ability of the trained penman to move his thumb, forefinger, and middle finger in such a way as to form letters without mutual interference. The term “coördination” as thus exemplified in trained muscular activity is capable of application to more elaborate functions. Conduct may be well coördinated when its elements are harmoniously organized to attain certain ends. Thought processes may be well coördinated. All these processes depend on a highly organized nervous center wherein the impulses are properly related so as to produce efficient results. The goal of education can be very properly described as the coördination of all the individual's functions.

C. H. J.

For coördination as a method of teaching, see **CONCENTRATION**. See also **DIFFUSION**.

**COÖRDINATION OF HOME AND SCHOOL.**—See **FAMILY, EDUCATION IN THE; PARENTS AND THE SCHOOL**.

**COOTE, EDMUND.**—An English schoolmaster of the first half of the seventeenth century. After being educated at Cambridge, he became headmaster of the grammar school at Bury St. Edmunds. He was the author of a most popular grammar intended for beginners. The book was entitled, *The English Schoolmaster, Teaching all his Scholars of what age soever the most easie, short and perfect order of distinct Reading and true Writing our English tongue, that hath ever been known or published by any*. The book had reached its forty-second edition in 1684, and was recommended by Brinsley (*q.v.*) and Hoole (*q.v.*). Not only does the book contain the alphabet and spelling lessons, but a short catechism, some psalms, a chronology, and a few pages on arithmetic. The *English Schoolmaster* is an important contribution not only to a knowledge of the method of teaching reading at the period, but of the contemporary elementary, petty, or dame schools. The book makes a special appeal to “such men and women of trade as tailors, weavers, shopkeepers, seamsters, and such others as have undertaken the charge of teaching others. . . . Thou mayst sit on thy shop board, at thy books, or thy needle, and never hinder any work to hear thy scholars.” The manual contains a well known “school code”

in nine stanzas addressed by *The Schoolmaster to his Scholars*.

**COPPÉE, HENRY** (1821–1895). — Educator; graduated from Yale in 1839 and the West Point Military Academy in 1845. He was eight years instructor at West Point, thirty years professor at Lehigh University, and nine years (1866–1875) president of the latter institution. Author of textbooks on logic, rhetoric and English literature. W. S. M.

**COPYBOOK.** — A book used in the teaching of penmanship in which copies are printed or written as models for the imitation of learners. See PENMANSHIP, TEACHING OF.

**COPYING.** — The method of copying or transcription is sometimes used in the teaching of spelling and composition, and in the memorization of literary selections. The method is used on the assumption that the motor accompaniment of writing in the process of copying helps to fix the spelling or literary form, as the case may be. The worth of the method depends largely upon concrete conditions. The pupil may or may not copy mechanically, he may or may not have his attention on all the elements necessary to right learning, — to the meaning, the sound, etc., as well as to the written form. The practice of writing words, once misspelled, a hundred times, from a copy of the correct spelling set by the teacher, is an instance of the ease with which the method of copying is applied in a mechanical way, with resulting failure.

See MEMORIZATION; SPELLING, TEACHING OF.

**COPY SETTING.** — A term used when the teacher writes or sets the copy, model, or example of penmanship which is to be transcribed and practiced by the pupils. Sometimes one copy is set upon the blackboard to be copied by all; at other times the teacher sets the copy on long slips of paper which are distributed to the pupils, each of whom practices and corrects his work by the copy or model on the slip.

**CORD WORK.** — See HOUSEHOLD ARTS.

**CORDERIUS, MATURINUS, or CORDIER, MATURIN** (1479–1564). — A French Protestant, at one time a teacher, and later a follower of Calvin. He was one of the most devoted schoolmasters of the period. In 1527 he resigned the chair of rhetoric in the Collège de la Marche to teach grammar in a school in order to evolve a good method for the teaching of Latin. The result of this work was the book

*De Corrupti Sermonis Emendatione Libellus* (A book for the purification of corrupt speech). In this he builds up a knowledge of Latin after using the vernacular as an aid in teaching beginners. At the age of forty-four he resigned a professorship at the Collège de la Rive in Geneva, in order to devote himself to teaching the lower forms, which he considered as deserving greater attention than they received. His fame rests on the *Colloquia, or Dialogues*, which he published in 1564, and which at once became established as a school textbook. (The full title of the work deserves notice: *Colloquiorum Scholasticorum, libri IV ad pueros in Sermone Latino paulatim exercendos recogniti*.) The work enjoyed as great a popularity as the *Colloquies* of Erasmus. They are marked as much by the attention paid to the training in citizenship, religion, and morals, as by the selection of topics of immediate interest to boys. Both Brinsley (*q.v.*) about 1612 and Hoole (*q.v.*) in 1657 translated the *Colloquies*. Several other translations continued to appear until the beginning of the nineteenth century. The work, especially in the form of *Select Centuries*, was used in schools in England until about 1840.

**CORK, UNIVERSITY COLLEGE.** — See NATIONAL UNIVERSITY OF IRELAND.

**CORNELL COLLEGE, MOUNT VERNON, IA.** — Founded in 1853 as the Iowa Conference Seminary; present title obtained by charter in 1857. It is a coeducational institution under the patronage of the Methodist Episcopal Church. Academic, collegiate, commercial, and fine arts departments are maintained. Fifteen units of high school work are required for admission to the freshman year in college. Students are admitted either by examination or on a certificate from an accredited high school. The courses which are offered in the college lead to the degrees of B. A., B. S., and B. S. in Civil Engineering. Students who complete a course in education receive a first-class five years' state certificate without examination. In 1910–11 there were 741 students enrolled in the college. There is a faculty of twenty-three professors and nineteen instructors and assistants.

**CORNELL, EZRA** (1807–1874). — The founder of Cornell University (*q.v.*); born at

Westchester Landing, N.Y., on the 11th of January, 1807. He received his education in the common schools and in business life. Besides an active business career, he served for several terms in the legislature of New York. He founded the Cornell Free Library at Ithaca, N.Y., in 1863, and two years later he founded the university that bears his name. He died on the 9th of December, 1874. W. S. M.

#### CORNELL UNIVERSITY, ITHACA, N.Y.

-- One of the most recent of the great non-state universities, incorporated in 1865 and opened in 1868. The opening of Cornell marked a new era in the history of higher education in America, illustrating as it did that the university can maintain high scholastic and cultural ideals while at the same time meeting modern needs and requirements. The establishment of the university was made possible through the sagacity and far-sighted administrative ability of Ezra Cornell. A practical man in intimate touch with the scientific requirements demanded by the rapid progress of his day, he saw the need of trained and practical scientists. He himself had amassed a large fortune, and he wished to found an institution where any person could find instruction in any study. As one of the trustees of the State Agricultural College at Ovid he was impressed with the importance of providing instruction in agricultural and mechanical arts. When Congress made the land grants under the Morrill Acts (*q.v.*) Cornell proposed that an institution carrying out the objects of the grants should be established at Ithaca for which he would provide the land, building, and equipment, if the land grant were transferred to this institution. After considerable political agitation, since there was a contemporary proposal to divide the grant, Cornell's scheme was approved by the New York Legislature in 1865. The charter was drawn up in that year with the assistance of the Hon. Andrew D. White, who gave valuable advice on the educational aspects. The aims of the institution are expressed in the words of Cornell: "I would found an institution where any person can find instruction in any study." Hence it was provided that students should be admitted "at the lowest rate of expense consistent with welfare and efficiency." To place the new university on a secure basis Cornell purchased land scrip granted to New York State, and held it until the prices should rise; the profits on the sales were to go to Cornell University. He personally supervised the location of the land in different states. His integrity was attacked by political opponents, but he successfully vindicated himself. His policy to hold the land until a favorable opportunity for selling arose was the means of securing an endowment for the university which assured future progress. In much of his labors he was assisted by H. W. Sage, himself an ardent supporter and patron of the university. Since the

state was making some contribution to the funds, it was provided in the charter that it should be represented. The Board of Trustees now includes the Governor, Lieutenant-Governor, Commissioner of Education, the President of the State Agricultural Society, the Commissioner of Agriculture, the Librarian of the Cornell Library, and the President of the University, all *ex officio*, fifteen trustees elected by the board, ten trustees elected by the alumni, and one by the New York State Grange. Further provision was made for the admission of students winning state scholarships.

Under the system which was introduced from the beginning provision was made for non-resident professors who should deliver courses at the university. Among these have been Louis Agassiz, James Russell Lowell, Theodore W. Dwight, and George W. Curtis. In 1868 Professor Goldwin Smith of Oxford, England, who was in full sympathy with a movement which Matthew Arnold thought was opposed to the ideals of culture, was appointed to the chair in English History. Hon. Andrew D. White, LL.D., became the first president of the university, and remained in that position for twenty years, while the young institution was finding a secure foundation. He was succeeded in 1885 by Charles Kendall Adams, who retired in 1892.

The university was opened for work in 1868. It was located at Ithaca, where Cornell already had purchased some land. The campus, which now covers an area of about 1100 acres, is situated in the heart of a most picturesque country. It overlooks Lake Cayuga, and is surrounded by beautiful waterfalls, cascades, and gorges, which have been preserved with great effort as the university gradually expanded. Among the more prominent of the numerous buildings are the University Library, which contains a library of 385,000 volumes, including the Andrew White collection of books bearing on the French Revolution, and the Fiske Dante collection of books and pamphlets; Boardman Hall, Stimson Hall, Sibley College, the Goldwin Smith Hall of Humanities, the Morse Hall of Chemistry, the Rockefeller Hall of Physics, the building of the New York State College of Agriculture, and the Sage Chapel. Although the establishment of the university was facilitated by the Morrill Acts, and the agricultural and engineering departments have developed rapidly, the other studies have not been crowded out, and a strong school in the humanities is maintained. The agricultural department is known as the "New York State College of Agriculture at Cornell University," and stands in intimate relation with the state, which made the erection of buildings possible in 1904. Students in this department who are residents of New York State pay no tuition fees. In addition to the college of agriculture, the university also includes the college of arts and sciences, law, architecture, civil engineering, the New York State Veterinary College, medical college (at New York

CORNELL UNIVERSITY.

and Ithaca), Sibley College of Mechanical Engineering and Mechanic Arts, and a graduate school. Students are admitted by examination of the university or of the College Entrance Examination Board (*q.v.*) or by certificate from accredited schools. Candidates for admission to the medical college must be either graduates from an approved college or scientific school or seniors in the university. Two courses are offered in law, one of three years and the other of four; candidates for the former are required to have had one year of college work, leading to an A.B. degree. The university is coeducational, special provision being made for the residence of women in the Sage College and Cottage. After an interesting struggle to become established, the fraternities have developed an active life. Besides a large number of local societies, chapters of nearly all the national fraternities have been established at Cornell, as well as four sororities. The Medical College at New York has chapters of Alpha Kappa Kappa, and Omega Upsilon Phi. The students generally live in fraternity and club houses or in private lodgings. The enrollment in 1909-1910 was 4227 students, distributed as follows: graduate department, 309; graduate students in undergraduate courses, 240; arts and sciences, 970; law, 264; medicine, 201; agriculture, 539; veterinary medicine, 100; architecture, 140; civil engineering, 559; mechanical engineering, 1186. In addition there were 987 students in the summer school of 1910. The faculty consisted of 138 professors, 82 assistant professors, 5 lecturers, 210 instructors, and 201 assistants, etc. The net income as reported for 1909-10 was \$1,637,299.25. The average salary of full professors is over \$3000. Jacob Gould Schurman, A.M., D.Sc., LL.D., is the president.

**CORPORAL PUNISHMENT.**—See **PUNISHMENT, CORPORAL.**

**CORPORATION SCHOOL.**—See **APPRENTICESHIP EDUCATION; FACTORY SCHOOLS; INDUSTRIAL EDUCATION.**

**CORPS.**—The name of one type of Student Association in the German universities. They originated at the beginning of the last century out of the *Landsmannschaften* (*q.v.*) and secret orders of the period. These associations are somewhat exclusive; they are bound by a rigorous code of honor and make a strong feature of dueling (*q.v.*) and the *Mensur* or fencing bout. Equality and brotherhood are assumed among all members of all corps. "The corps have always had the reputation of being on the right side politically," although politics play no part in the organizations. The members are recruited from the upper classes of society. The names are taken from different districts of Germany, but the membership of each corps is not restricted by residence qualifications any longer. Since 1853 the *Köseuer Senioren-Konvent* has served as a central representative body of all the corps. The *Akademische Monatsheft* is the organ of these associations.

**CORRECTION, HOUSE OF.**—The institutions to which this term is applied are not commonly educational, as might be inferred. It is applied to a variety of institutions for adults whose offenses are not felonies. Vagrants, drunkards, and deserting husbands are most commonly assigned to houses of correction, partly with the idea of obviating some of the moral effects which would follow commitment to a jail or prison, and partly in the belief that a term in the house of correction will tend to make the offender reform and lead a better life. It is agreed by penologists that the educational aspect of the institution has not yet been developed.

See **CORRECTIONAL EDUCATION; PENOLOGY, EDUCATIONAL ASPECT OF.**

**CORRECTION OF ERRORS, METHODS OF.**—Teaching methods may be grouped into two classes as they deal with two differing mental situations. One class of methods aims primarily to extend the power of the child over new facts, relations, forms, conventions, etc.; another group is primarily designed to correct the misinterpretation of facts and the misuse of forms, symbols, etc. In the first instance successful teaching proceeds from ignorance to knowledge, in the second from error to knowledge. The first situation is uncomplicated,

and the method of its treatment is direct and constructive. The second situation is complex, as there are facts and connections established in an erroneous manner. Here, the method aims at the modification of an old series of associations, or at its elimination and the substitution of a new series. In a general sense, methods of this second class are spoken of as "methods for the correction of errors." In current usage the phrase is more frequently applied to that narrower and more specialized group of methods employed in the correction of purely formal errors, or errors of convention, as in the correction of mistakes in spelling, language, arithmetic, and other so-called "formal subjects."

Too frequently the methods of correcting language and other errors are inadequate. They do not involve a sufficiently varied or continued treatment. A sound psychological method would distinguish three distinct stages in the correction of errors in linguistic habit. (1) The error or variation from established usage must be sensed by the child. This may be done by calling the error to his attention deliberately or by sensitizing him to the possibility of error when there is a conflict between his own usage and that of others. (2) The right form must become known to the child, and clearly comprehended by him. There are a number of ways by which this may be done. The teacher may simply tell him the correct usage, he may find it himself by reference to the dictionary or grammatical rules, or he may gather it from usage itself. (3) The knowledge of the right form must be converted into a practiced and habitual use that permits no lapses into the previous error. Continuous re-impression of the right form in connection with the idea of its meaning is necessary here. This last stage of treatment requires considerable time and effort, which most teachers and parents do not give. Even after the teacher's efforts to habituate the new usage have commenced, the child will continue to use the old and incorrect form in the spontaneous speech of his everyday life outside the school-room. Later he will use the wrong and the right forms interchangeably. This is the promising period. If the teacher's efforts are still maintained, the correct form will become dominant, and the error stand corrected.

Owing to the influence of bad example and the constant practice of wrong habits which the natural life of the child affords, the school works at a disadvantage in the correction of errors. In order to compete, the school should center its efforts on the most important errors, letting the minor ones go for the time being. As children write less than they speak outside of the classroom, errors peculiar to written language, such as capitalization and punctuation, may be corrected more rapidly than those of oral expression. Only a single correct form should be brought into competition with an incorrect

usage for the time being. The possession of one accurate form should take precedence over versatility in speech. A controversy exists as to whether errors of language should be corrected as soon as they occur, or brought to attention later. On the basis of what has been said of the stages in the correction of errors, it is apparent that complete correction cannot be achieved merely through a momentary interruption of speech for the purpose of calling the attention of the student to his mistake. Such treatment leaves much to be done later, and only breaks the thread of thought. The method of immediate correction would seem less useful as the children are young and lack self-command.

There is a considerable difference between correction by the teacher and self-correction. In the first case, the teacher may note the wrong usage, provide the right one, and conduct the exercise that will lead to a new habit. In the second case the child himself must discover his own error through his quick sensitiveness to the difference between his own and another's speech; he must be able to consult authoritative works and determine the right and wrong of usage; and finally he must have the initiative and persistence to drill himself in the right form. The school must use both methods, that of correction by the teacher and that of self-correction, inasmuch as they are supplementary.

**CORRECTIONAL EDUCATION.**—The progress of social economy during the nineteenth century differentiated many aspects of dealing with the delinquent or prospectively delinquent. Out of the science of penology, (*q.v.*) came the study of reformatory education, and the system of public schools developed parental schools, truant schools, and disciplinary schools. The aim of the various types of education here considered is correctional, that is, it aims to correct the bad habits, vicious knowledge, or wrong predispositions already formed in the bad environment or possibly in connection with an unfortunate heredity, and in accordance with the age and circumstances of the pupil to make of him, by special educational methods, a better citizen. Reformatory education (*q.v.*) commonly deals with first offenders and others of an age ranging from sixteen to twenty-five. These must be confined in essentially prisonlike institutions and be committed through due process of law. The education becomes increasingly industrial in character, and a system of indeterminate sentence coupled

with release on parole has complicated and rendered the entire system more efficient.

Reform schools (*q.v.*) are designed to receive legally committed offenders under the age of sixteen, and usually do not keep these beyond eighteen. Here again the education is industrial in character, with especially strong moral features. Owing to better means of control, these schools tend less to resemble prisons.

Parental Schools (*q.v.*) are boarding schools like reform schools, and their inmates are usually of the same age and general characteristics, but their commitment is due to habitual truancy and their incorrigibility in the school sense.

Truant Schools (*q.v.*) are sometimes parental schools under another name and sometimes day schools in which the truant is set apart for special educational treatment. Disciplinary classes (*q.v.*) are special or ungraded schools formed within the ordinary public school, and design and make possible the special treatment of boys and girls who are hard to discipline in the ordinary schools. These are yet experimental in character.

Special modifications of the above forms are found. Reform schools, receiving children under fourteen and not technically criminal, exist to some extent under philanthropy. Special industrial schools for negroes present peculiar problems, partly in view of the fact that most of those committed are usually the victims of neglect. A number of states and philanthropic bodies maintain special industrial or reform schools for girls. A few juvenile reform schools under private direction have become self-governing communities. A special form of day truant school is found in English cities, in which the children, usually those whose parents both work, stay in the school the entire day and return home only when the parents have arrived from work. (See INDUSTRIAL SCHOOLS.) Houses of correction are usually short-term prisons and do not employ educational methods in the sense above implied, but it must be noted that the science of penology is to an increasing extent becoming an educational science, in that reformation, more than punishment for its deterrent effect, is to an increasing extent the controlling aim.

Various phases of correctional education will be treated under the heads above mentioned.

**CORRECTIVE METHODS.**—Any methods primarily intended for the correction of knowledge or conduct. In the use of "corrective" methods, the error or wrong is assumed to exist. Corrective methods are usually contrasted with "preventive" methods, where the intent is to safeguard against a specific fault

likely to arise. Where "corrective" methods are applied to conduct, they are frequently termed "correctional" methods, hence "correctional institutions," "houses of correction," etc.

H. S.

SEE CORRECTION OF ERRORS, METHODS OF; PREVENTIVE METHODS; METHODS, TEACHING; TYPES OF TEACHING.

**CORRELATION.**—As applied to the work of education, this means the interrelation of studies so that the material of each lesson is made interesting and intelligible through its connection with the points involved in others. In general three reasons for correlation have been urged. First, correlation enables the child to comprehend better the meaning and bearings of what he studies. The more thorough the correlation, the richer the intension of the ideas that are presented. Without correlation study is irrational, wooden. It becomes a mere appeal to mechanical memory. The proper interrelation of the material of instruction makes it intelligible, more easily memorized and retained, and more significant. Second, correlation is held to make study interesting, for it connects the work of the lesson with what the child already knows and is interested in. To find in the new the familiar is ever a source of pleasure. To be able to unravel, explain, perhaps anticipate the work of the new lesson, as a result of applying what is already learned, is a power the exercise of which is a continual delight to the pupil. Third, correlation makes the application of the knowledge gained in school to practice both within and without that environment far more easy, and so far more likely. This result is due, first to the fact that it cultivates in the child the tendency to apply his knowledge to the comprehension of new ideas and the solution of new problems and second to the enhanced power of recall that springs from the many associations which it establishes. To be able to apply knowledge, one must be accustomed to the practice of hunting within himself for ideas with which to deal with new situations, and the experience that he has already obtained must readily rise into memory when it is needed. Correlation cultivates the tendency to think, and facilitates the recall of resources to sustain the thinking process. The general conception of correlation is applied to the work of the school in a great variety of ways. These types of correlation may be reduced to three groups: (1) correlation within the content of a subject; (2) correlation among the different subjects in the course of study; (3) correlation between the school work and life outside.

1. The correlation of the material of a subject means, of course, that arrangement by which each topic is a natural outcome of the preceding one and a natural preparation for the next. It is the grading of the subject matter. Grading may follow either what is known as the logical order or the so-called psychological

order. The logical order implies any systematic development of the subject from premises to a logical conclusion. The psychological order implies such an arrangement as appeals to the child's interests and powers of comprehension. The psychological order involves certain logical principles of arrangement, but not all logical arrangement is effective in its psychological appeal. In learning written language, it is logical to begin with the letters. However, it is not a good psychological order to make such a beginning, especially with little children. Until they are combined in words, letters are meaningless, and, as a rule, uninteresting abstractions. The natural, or psychological, first step is to begin with words and sentences, which have meanings and may easily be interesting. The alphabetic method is logical but not psychological; the word method is both.

2. When one speaks of correlation in education, it is ordinarily the second type that is in mind, that is, the interrelation of subjects in the curriculum. Such correlation may be of two sorts, which may be called incidental and systematic. Incidental correlation is that which arises as a result of the broad presentation of a topic to a class. If the teacher is giving a history lesson on the discovery of America by Columbus, and makes use of arithmetic, geometry, geography, natural history, literature, and drawing as a means of developing interest in the class and giving a comprehensive notion of the event, she is employing correlation. Systematic correlation involves such arrangement of the content of the various subjects in the curriculum as makes them constantly bear upon each other. The day's work in arithmetic, for example, is planned, not merely to spring out of the preceding lesson in arithmetic and to lead to the following lesson in that subject, but also to be a natural outcome of the work which has just been done in geography, nature study, constructive work, or perhaps even history and literature, and to prepare for immediate onward progress in all these lines. Incidental correlation arises from day to day, and is a necessity of good teaching; systematic correlation requires a planning out of the whole course of study. Systematic correlation may be minute and specific, or merely general and loose in character. The daily work in each subject may be made to bear on the daily work in correlated ones. The topics may be selected to correspond as closely as possible. For example, the history, the geography, the drawing, the nature study, the arithmetic, the literature and composition might deal with the discovery of America. This would be close correlation. On the other hand, the curriculum may be planned merely to make it likely that when a topic is taken up in a certain subject, the pupil will be in the possession of such knowledge from other subjects as is necessary to its adequate comprehension. Close correlation is apt to become superficial and ridiculous. For example,

the topic of the school day might be the egg, which could be studied not only from the point of view of nature study, but as the theme of other lessons. It could be drawn, measured, and weighed. It could be studied as an article of trade in commercial geography. Literature dealing with the egg might be found; if nothing else, then Humpty Dumpty from *Mother Goose* or the tale of the Roc's Egg from the *Arabian Nights*. In history the legend of Columbus and his problem of standing an egg on end might be read. To conclude, the composition work might bear on the same theme. Such close correlation has undoubtedly done much to discredit the idea altogether. The difficulty arises because close correlation seems to demand that the same topics as well as the same principles shall run through the lessons that are studied each day. Indeed, it seems difficult to provide a specific correlation of principles without unity of topics. Now, while the topics of some subjects, such as history and geography, can be fairly easily made to correspond, it is evident that others will not fit so well; for example, natural science and literature. Close correlation usually culminates in a scheme of concentration (*q.v.*) where there is one central subject, for instance, history, which constitutes the core of the curriculum; other subjects are studied only as they contribute to the comprehension of the topic of the day in this central subject, or as they contain topics which can be related to this.

3. The third type of correlation is that between school work and the life outside. Of this we may note three phases, the correlation of school and home, of school and vocation, and of school and the entire present or future outside activity of the pupil. The last sort of correlation includes, of course, both the others, but it also goes beyond them. The correlation of home and school aims primarily at discipline and moral culture. It presents two phases, first the introduction of a home atmosphere into the school, and second the endeavor on the part of the school to secure the assistance of the home in controlling the child and in interesting him in its work. Further results follow from the establishment of cordial relations between the two institutions. These are: (1) The school is able to learn more about the individuality of the pupils by getting the suggestions of the parents and by studying home environments and hereditary traits. (2) The school gets the co-operation of parents not only in discipline, but also in connection with the studies pursued. Hence we have home work, report cards, and similar practices. (3) The school endeavors to transform the home through its educative influence on the children. In this connection the clubs of the school, parents' meetings, etc., are utilized.

The problem of correlating the school with the vocation has led to the rise of vocational schools and the issue of vocational education.

This is discussed in special articles. The idea of relating the school to life in general has involved especially the attempt to transform the school activities so that they should so far as possible resemble the concrete situations in the world at large. The endeavor to bring about this result is one of the leading features of school reform to-day. It has taken the form of attempts to make the school a place of social co-operation rather than of individual learning; to connect theory with practice by causing the child to apply whatever he learns, or to learn through doing, or perhaps merely as an incident to the solution of certain practical problems that arise in the school life; and finally, to make sure that the problems of the school represent typical ones in real life. (See EXPERIMENTAL SCHOOLS.)

The principle of correlation has appeared wherever educational reform has reacted against the isolation and mechanical character of school work. It is especially in evidence in the criticisms of the realists of the seventeenth and eighteenth centuries upon the linguistic instruction in the secondary schools. It was urged that knowledge should be made more practical, that words should be taught only in connection with things, and that living as well as dead languages should receive attention in the schools. Comenius (*q.v.*) especially may be regarded as an advocate of correlation between language and science, school and home, theory and practice. The French reformer, Jacotot (*q.v.*), pushed the idea to a somewhat extreme conclusion in his maxim "all is in all," a practical application of which is found in his view that a thorough study of the *Télémaque* of Fénelon would involve a complete education. It is, however, especially to Herbart and his followers that we owe the modern emphasis upon the principle under discussion. His notion of apperception, when applied both to method and to the course of study, meant constant interrelation of the material of instruction. Indeed, his followers interpreted this system and unity to involve concentration. Utilizing certain hints of the master, Ziller (*q.v.*) developed therefrom the plan of instruction, having history as its center and the notion of the culture epochs (*q.v.*) as its principle of arrangement. The idea of correlation was made prominent in the United States through the influence of the Herbartians, and the brilliant advocacy of Colonel Parker (*q.v.*). It seized the attention of the teachers in general, and was made the central principle in a proposed reorganization of the secondary school program submitted by the Committee of Ten (*q.v.*), to the National Educational Association in 1894. This was followed by a similar scheme proposed for elementary education by the Committee of Fifteen (*q.v.*) and reported to the same Association in 1895. These schemes have been criticized as not providing genuine correlation, but they mark the point of highest general interest

in this specific topic in the United States. It is interesting to note that the committees emphasized especially the disciplinary effect of studies. (See FORMAL DISCIPLINE.) It was assumed that each subject gives a special sort of discipline, that enhances the ability to deal with any subject where similar mental powers are required. Correlation here means the proper organization of these disciplines, so that we have as a result both the highest degree of mutual assistance among the forms of training, and the all-round development of the individual. One of the most recent notable attempts at correlation is that suggested by Professor Dewey for the Experimental School at the University of Chicago. It was essentially a plan for concentration about the social life of the school. E. N. H.

*Mental and Social Measurements*. (New York, 1904.)

**CORRESPONDENCE SCHOOLS.** — As the name indicates, these are educational institutions in which instruction is carried on by correspondence. They differ from the ordinary schools chiefly in the fact that their students, instead of being required to reside at, or near, the institution, and to attend classes for the purpose of receiving oral instruction, are provided by their instructors with written or printed outlines of the course or courses to be pursued, sources of information, suggestions, directions, and questions, and are required to submit reports and answers in writing. The mails are the sole medium of communication between teachers and pupils. Such schools are well calculated to serve those who wish to study under expert direction, either for self-

improvement alone, or for any special purpose connected with a trade or calling, and who for any reason are unable to attend the regular sessions of an ordinary school, college, or university. At present there are, in the United States alone, more than two hundred correspondence schools. Some institutions calling themselves correspondence schools are little more than names, others are primarily organizations for the advertisement and sale of textbooks; but there are many which are legitimate educational institutions and provide excellent instruction. Schools of this latter class deserve and receive recognition as effective educational agencies, and their patronage shows an extraordinary demand for the kind of instruction they offer. A single correspondence school of the better class has had an enrollment, during its existence of twenty years, of 1,281,800 students. The teaching organization of this school falls into thirty divisions, and even the subjects of these divisions do not include all the branches in which courses are offered by other institutions of the same kind.

Systematic instruction by correspondence owes its origin to the University Extension movement which began in England in 1868. Soon after that time, an English society was formed for the encouragement of home study. It limited its offer of assistance to the well-to-do, and confined itself chiefly to providing plans of work without correspondence. In 1873 the idea was transplanted to America. In the autumn of that year a society was organized in Boston which called itself a "Society to Encourage Studies at Home," and which added to the plan of the English society regular correspondence with its members. In 1883 a "Correspondence University," consisting of an association of instructors from various colleges and universities, was formed with headquarters at Ithaca, N. Y. The object of this university, as expressed in its announcement, was "to supplement the work of other educational institutions, by instructing persons who from any cause are unable to attend them." Meanwhile, Dr. William R. Harper, then Professor of Hebrew in the Baptist Union Theological Seminary, was offering correspondence courses in Hebrew. Later, at Yale University, he offered additional courses in New Testament Greek and in Biblical Literature and Interpretation. When the University of Chicago was established in 1892, with Dr. Harper as president, teaching by correspondence was adopted as a method of university instruction through the Correspondence Division of the University Extension Department. The first correspondence study student was enrolled in October, 1892, the month in which the university opened. In the year 1908-1909, the number of students enrolled for correspondence study in that institution was 2386. One hundred and thirty-two teachers gave instruction in 335 courses. Other universities, notably Wisconsin,

Brown, and Nebraska, were quick to follow the initiative of the University of Chicago. Correspondence study thus had a university origin, and owes its recognition as a legitimate method of university instruction chiefly to Dr. William R. Harper, to whom credit is due also for the inspiration which led to the establishment of the first school based strictly upon the correspondence study idea, namely, the Sprague Correspondence School of Law, organized in 1890 and incorporated in 1891.

It is not to university sources alone, however, that the correspondence schools of to-day owe their idea and their origin. They have another and quite independent parentage. In a daily paper published in Shenandoah in the coal-mining district of eastern Pennsylvania, there was in the eighties a department devoted to the education of miners in the principles of mining and the methods of protecting themselves from the dangers of their calling. Mine foremen were required to pass an examination "in the laws of mine ventilation, safe methods of mining, and the means of controlling dangerous natural phenomena incident to coal-mining." The editor had organized a mining institute with an educational object, and had republished and circulated some of the best foreign books on the prevention of mine accidents. He then conceived the idea of devoting a column of his paper to questions and answers relating to mining. The questions of the Mine Examining Board were stated, explained, and illustrated. A small textbook on coal-mining was published for the use of mine foremen. In 1891 a course covering the subjects of coal-mining, mine-surveying, mine machinery, etc., was prepared and later developed into a complete coal-mining course. In the same year the plan of teaching by correspondence was adopted. From this simple beginning has developed the International Correspondence Schools of Scranton, Pa., with courses in more than two hundred subjects and with students in all civilized countries of the world.

The methods of instruction employed by the various correspondence schools differ in details, but in general they are practically as follows: A syllabus containing, perhaps, an outline of the course to be pursued, with lesson assignments or lesson papers, is sent to the student with special directions in regard to the work to be done. A report upon each lesson, with such questions as the student may desire to ask, is returned to the teacher, who corrects the errors of the report, writes upon it such criticisms and suggestions as he may desire to make, and returns it to the student. The time required for the completion of the course varies with the amount and difficulty of the work to be done. With this description of the method of instruction employed by correspondence schools, it will appear that some subjects lend themselves more readily than others to correspondence study. A course requiring elaborate

and expensive apparatus, or the facilities of an extensive library, cannot as well be conducted by correspondence as a course in the common branches, the languages, history, or literature. Many difficulties are overcome by the preparation of textbooks specially designed for correspondence teaching. The necessity imposed upon the student by the correspondence method of instruction of writing all answers to the questions of his instructor, as well as the questions presented by himself, is a distinct advantage over the classroom method, and it is the testimony of many of those engaged in correspondence teaching that the work done by correspondence is even better than that done in the classroom. Hence the correspondence school, both on account of the kind of work it may do, and the large number of persons to whom it brings educational opportunities not otherwise available, is a valuable and permanent agency in the work of education.

I. W. H.

**CORRESPONDING POINTS.** — These are points on the retina of the eyes whose impressions unite in binocular vision to give a single perception. All foveal points are thus correspondent, and in general any points of one retina are correspondent to geometrically similar points of the other. Any fixated object (foveal vision) thus yields but a single impression, and any points not fixated, but falling on corresponding points, appear to occupy the same position in relation to the point of fixation. Objects are seen double when they fall on non-corresponding points. Thus, if a finger of one hand is placed before the eyes and one of the other hand a little farther away, and either finger is then fixated, the other appears double.

**CORTEX.** — See NERVOUS SYSTEM.

**COST OF EDUCATION.** — As a general rule reports of cost of education have been almost valueless owing to lack of uniformity over large areas in the details reported or the facts evaluated. A flagrant example of useless reporting of cost of education is the listing of totals. Thus the statement that the cost of common schools in the United States during 1906-7 was \$336,898,333, and that the total cost has doubled within fourteen years is both meaningless and misleading, for while the actual expenditure for schools has doubled in this time, the expenditure per pupil in average daily attendance has increased only 52 per cent. To have any significance all statements as to cost must be reduced to relative terms and uniform standards must be adopted throughout the country. For cost of education in America see the articles on the State Systems; see also REPORTS AND RECORDS; BUDGET, SCHOOL.

**Other Countries.** — Owing to the varied standards used by different countries, it is impossible to utilize their statistical material in making more than a rough comparison of expenditures. The types of education vary largely even among different American states. In some cases all forms of current expenditure, including interest on bonds, are included, in other cases these are omitted. In France the payment of teachers' pensions is not reckoned in the cost of education, whereas in Germany it is. Secondary education, which is much more expensive than elementary, begins in European states earlier than in America, and in Germany its cost is always reckoned on a separate basis. For details of the cost of education see under the separate national systems, especially ENGLAND, EDUCATION IN; FRANCE, EDUCATION IN; GERMANY, EDUCATION IN.

D. S.

See BUDGET, SCHOOL; CITY SCHOOL ADMINISTRATION; REPORTS AND RECORDS.

**COSTA RICA, EDUCATION IN.** — The republic of Costa Rica extends over an area of 18,400 square miles occupying the southern part of Central America, and directly united by the Isthmus of Panama with South America. By reason of its position this state has been more directly affected by the events that have made the United States government a controlling power in the affairs of the isthmus than any other division of Central America.

The constitution of Costa Rica, which forms the basis of the present political system, was promulgated in 1870, but has been frequently modified since. It was not until 1882, after a series of dictatorships, that the government really assumed the republican form. The central administration of public affairs is vested in four ministries, or executive departments, under the president of the republic. Public instruction and justice are both included in the ministry of foreign affairs. For local administration the republic is divided into five provinces and two *comarcas* (territories). The latter are Puntarenas, part of the Pacific coast line, and Limon, the whole of the Caribbean coast. The five provinces are as follows: San Juan (capital San José, also capital of the republic); Alajuela (capital Alajuela); Heredia (capital Heredia); Cartago (capital Cartago); Guanacaste (capital Liberia.) The population, as estimated Dec. 31, 1908, was 361,779, including between three and four thousand aborigines. The population of the chief cities and adjacent regions is chiefly of pure Spanish origin or descent. The state religion is Roman Catholic, but the constitution guarantees entire liberty of faith and worship.

At present the government is actively engaged in endeavors to develop the internal resources of the country, to encourage friendly relations with foreign powers, and to improve the social and intellectual condition of the people. These purposes impart new importance to the

system of public instruction, which is, theoretically, at least, well organized as a department in the ministry of foreign affairs and justice. The head of the department, at present, Señor Don R. Brenes Mesen, bears the official title of Subsecretario de Estado en el Despacho de Instrucción Pública. The secretary is assisted by a Council and an Inspector-General.

The political divisions of the country form areas for the administration of primary instruction. The provinces are divided into circuits, and the latter into districts. Each district has its school board, which looks after the financial interests of the schools; the governors of the several provinces are responsible for the execution of the school law in their jurisdiction. The technical direction of public primary schools, however, is entirely under the government inspectors, assigned to the several divisions, who are directly responsible to the central authority. At the head of each circuit of a division there is an assistant inspector who comes into immediate relation with the primary schools. Elementary education is by law compulsory for children seven to fourteen years of age, and is gratuitous in public primary schools. The schools are established and partly maintained by the district school boards, but the government pays the salaries of teachers and also augments the local school funds by grants from the treasury. Official statistics for 1908 give 30,000 pupils in average attendance at the public primary schools. This implies an enrollment of nearly 40,000, or at least 10 per cent of the population, which is an unusually high rate, considering the general circumstances of the country. The government appropriation for primary schools already amounts to \$325,000 annually, and this sum will be increased by the expenditure for the normal school, which has been projected on a large scale, and for the encouragement of industrial education. A decree of July 16, 1908, provided for the payment of a monthly subsidy of \$232.50 to the municipality of the central canton of the Province of Alajuela for the founding and support of a school to give instruction in the manufacture of all kinds of woven fabrics. On Sept. 25, 1909, President González Víquez signed decrees for the establishment of preparatory schools of arts and crafts (*Escuelas Preparatorias de Artes y Oficios*) and of schools of domestic instruction for women in the various provincial capitals. In addition to the regular scholastic course, the new regulations prescribe training in various manual branches, including carpentry, cabinet work, horseshoeing, tailoring, shoemaking, painting, and tinning. In the women's department, instruction will be given in cooking, washing and ironing, sewing, etc., and such branches of higher manual training as are applicable to household arts and home sanitation. To meet the increasing expense of maintaining the primary schools a law was passed on Sept. 24, 1908, establishing a tax of 10 cents per liter of alcohol and other liquor

sold in the national factory and its branches, the revenue thereby derived to go to a fund known as the "national education fund."

At the second Central American Conference, held at San Salvador in 1910, provision was made for establishing a pedagogic institute for Central America in Costa Rica. A suitable location for the buildings of the institute was selected in the vicinity of Barba and plans for the erection are in progress. This choice marks a fitting recognition of the educational progress of Costa Rica.

Public secondary and higher education are directly under the minister of public instruction. There are at present five public secondary schools, namely the Liceo de Costa Rica; the Colegio Superior de Señoritas; Liceo de Heredia; Instituto de Alajuela; and Colegio de Cartago. The first three are supported entirely by national funds, while the expenses of the last two are met equally by municipal and national funds. The Liceo de Costa Rica, for boys, has a department given over to normal training, as has also the Colegio Superior de Señoritas. The government divides 130 scholarships between the two institutions, and supplies the textbooks for the holders of the same.

The plan of studies adopted for the Liceo de Heredia illustrates the scope and character of secondary education. The entire course is arranged in two cycles; the first cycle, which is preceded by a preparatory year of elementary studies, comprises three years, with program as follows:—

SUBJECTS	HOURS A WEEK IN CLASS			
	FIRST YEAR	SECOND YEAR	THIRD YEAR	TOTAL
Moral and intellectual				
Spanish . . . . .	4	3	3	10
English . . . . .	4	4	3	11
French . . . . .		3	3	6
Geography . . . . .	3	3	3	9
History . . . . .	5	5	4	14
Mathematics . . . . .	2	2	3	7
Physics . . . . .	2	1	2	5
Chemistry . . . . .	1	1	2	4
Natural sciences . . . . .	1	1	1	3
Anthropology . . . . .	1	1	1	3
Hygiene . . . . .	1	1	1	3
Morals and civics . . . . .	1	1	1	3
Logic and ethics . . . . .				
Total . . . . .	22	24	24	70
Physical and æsthetic				
Drawing . . . . .	2	2	2	6
Writing . . . . .	2	1	1	4
Singing . . . . .	1	1	1	3
Gymnastics . . . . .	2	2	2	6
Manual training . . . . .	2	2	2	6
Total . . . . .	9	8	8	25
Grand total . . . . .	31	32	32	95

The second cycle of the secondary course, which comprises two years, is divided into four parallel sections, namely, section of humanities, and normal, commercial, and technical sections.

The program of the section of humanities is as follows:—

SUBJECTS	HOURS A WEEK IN CLASS		
	FOURTH YEAR	FIFTH YEAR	TOTAL
Spanish Grammar . . . . .	2	2	4
Classic literatures (studied by periods) . . . . .	3	3	6
English . . . . .	3	3	6
French . . . . .	3	3	6
History of civilization . . . . .	2	2	4
Mathematics . . . . .	2	2	4
Physics . . . . .	2	2	4
Chemistry . . . . .	1	1	2
Natural sciences . . . . .	2	2	4
Cosmography . . . . .	1	1	2
Psychology and logic . . . . .	2	2	4
Civics . . . . .	1	1	2
Drawing . . . . .	1	1	2
Gymnastics . . . . .	1	1	2
Practical manipulation . . . . .			
Physics . . . . .	1	1	2
Chemistry . . . . .	1	1	2
Natural sciences . . . . .	2	2	4
Total . . . . .	30	30	60

In the normal section pedagogy takes the place of classic literature, the time given to French and English is reduced, hygiene and school sanitation take the place of cosmography, and agriculture is introduced. The students also spend ten hours a week in teaching. The programs of the commercial and technical sections are confined to their respective specialties. The secondary schools, public and private, prepare for the specialized higher education, which is represented by the faculty of medicine at San José and by schools of dentistry, pharmacy, and law. The influence of the medical fraternity is indicated by the measures for promoting public sanitation. For this purpose the country is divided into twenty-six districts, each under a medical supervisor who receives an annual salary from the government. With a view to improving sanitary conditions in San José, the capital, and in the municipalities of Heredia, Santo Domingo, and Barba, the Department of Finance resolved, on Jan. 9, 1909, to issue two series of municipal sanitation bonds. The Fourth International Sanitation Conference of the American Republics was held at San José, in December, 1909, under the presidency of a distinguished Costa Rican, Dr. Juan J. Ulloa.

The development of the agricultural resources of the country is the purpose of the National Society of Agriculture, which was founded Apr. 28, 1903, and in March, 1909, adopted by-laws greatly extending the scope of its operations. The Secretary of State of Costa Rica is the honorary chairman of the society, and presides over its meetings, and the government lends active and powerful support to its operations.

**COTGRAVE, RANDLE.**—An English lexicographer who was educated at St. John's College, Cambridge, c. 1587, and became secretary to William Cecil, afterwards second Earl of Exeter. Cotgrave produced the great standard *Dictionnaire of the French and English Tongues* (London, 1611 fol.). This also contains, "Brief directions for such as desire to learn the French tongue." Miss Lucy E. Farrer, in a monograph in French on the life and works of Claudius Holyband (Paris, 1908), shows that Holyband's French and English Dictionary was already augmented by Randle Cotgrave in 1608, and his own great work thus took three years to complete. Cotgrave had as predecessors in writing French dictionaries, Jean Véron in 1552, John Baret, 1573 (*The Alcegaric*; see BARET, JOHN), and Holyband. But a comparison between these works and that of Cotgrave shows that the latter is of high preëminence. Cotgrave's *French Dictionary* appeared in 1611. In 1632 R. Sherwood "annexed a Dictionary of the English set before the French," and finally the definitive edition of Cotgrave was produced by James Howell with "animadversions and supplements" in 1650, 1660, 1672-1673, fol. F. W.

**COTNER UNIVERSITY, BETHANY, NEB.**

—A coeducational institution founded in 1888 under the auspices of the Churches of Christ in Nebraska. Academic, collegiate, normal, commercial, and fine arts courses are offered. Approximately fifteen units of high school work are required for the freshman year. Classical, sacred literature, philosophical, and collegiate normal courses are offered, leading to degrees. The teaching staff consists of thirty members.

**COTTEY COLLEGE, NEVADA, MO.**—

Founded in 1884 for the education of young ladies. Primary, academic, collegiate, and musical departments are maintained. Two years of collegiate work, based on four years of high school work, are given. There are five professors in the literary department.

**COULANGES, FUSTEL DE.** (1830-

1889).—One of the greatest antiquaries and historians of the last century. He was born in Paris, and for a time studied at the École Normale. He was a member of the French School at Athens, and as a result of researches there he published *Memoire sur l'Île de Chio*. As professor of history in turn at Amiens, Strass-

burg, and Paris, he insisted on the importance of original sources and material for a study of the subject. His lectures at the Sorbonne, where he was first professor of ancient and then of medieval history, attracted large audiences. The latter chair was established in his honor. For a short time he was also director of the *École Normale*. Coulanges won a great reputation through his excellent writings in history and sociology. The most important of these are *La Cité Antique* (1864), a book dealing with the religion, laws, and institutions of Greece and Rome, and *Histoire des Institutions politiques de l'ancienne France* (1875-1890). The latter work is not complete. Coulanges was a painstaking student who in his works combined ability in research with clearness and polish in style.

**COUNCIL OF EDUCATION.** — One of the departments of the National Educational Association, organized about 1884. It has a limited membership (sixty in 1906) elected out of the active members of the Association. The special purpose of the Council is to afford opportunity of closer study of problems which demand research and special investigation. When it is found that a special report is desirable, the Council makes recommendations to the Board of Directors to this end. A variety of reports like those of the Committee of Ten, (*q.v.*), the Committee of Twelve, the Committee of Fifteen (*q.v.*), and the Committee on teachers' salaries have been projected by the Council. In recent years a special feature of its meetings, which take place at the same time as those of the National Educational Association, has been a report on educational progress for the year.

See also NATIONAL EDUCATION ASSOCIATION.

**COUNTERPOINT.** — See MUSICAL TERMS.

**COUNTING.** — The first step in the historical development of arithmetic was to count things. The world seems to have taken this natural prerequisite step long before it had any idea of the operations on numbers. Indeed, certain lower forms of animals have a kind of pseudo-counting that enables them to distinguish between numbers of like objects up to five or six. The primitive savage seems to have been content to count only to two or three. These, therefore, were primitive limits that in time developed into primitive scales, so that hunters counted by braces as we count by tens, a custom that was found by the early explorers of Queensland and New Holland. Three seems to have been quite a general scale, and still has the primitive meaning of much or many, as in the Latin *ter felix*, and the English "thrice blessed." Four seems also to have been a radix for counting, as when fishermen count by throws or casts, and as in the Latin

*ter quaterque beati*. The first generally received radix was five, because of the five fingers on the hand, and there are many traces in language of the use of the word for hand to signify the number five. There are few traces of scales between five and ten, because a people that used the fingers of one hand for their radix would naturally use the fingers of two hands if they needed a larger radix. There seems at an early stage, however, to have been a rather extended use of the radix twelve, perhaps derived from the lunations, but probably because it is a more convenient radix than ten. The convenience of a radix depends upon two things: (1) its divisibility, allowing for numerous factors, and (2) its size. If a radix is too small, a written number becomes too long for convenience, thirty-two on a scale of two being written thus: 100,000, which is  $10^5 10$  meaning one two and no units. If a radix is too large, then too many different characters must be learned, the number of characters being the same as the radix. On account of its medium size and of its divisibility, twelve is a particularly desirable radix for a system of counting, and it is unfortunate, from the mathematical point of view, that mankind did not have twelve fingers so as to lead to counting on a duodecimal scale.

About the year 1880 considerable interest was manifested in educational circles in the counting method of teaching the number tables. This interest was due largely to the works of two German teachers, Tanek and Knilling. They asserted that number is not properly the subject of sense perception, as the followers of Pestalozzi had assumed, but that it was put into things by the mind. They, therefore, proposed to make much of the mere sequence of number names, and to utilize the child's love for the rhythm of counting. Hence they brought children as soon as possible to count rapidly, far beyond the numbers that they could visualize, allowing the association with large groups of objects merely to be suggested by the association with small groups. By this plan children count rapidly by twos, from one to nine and from two to ten, thus learning both the addition and the multiplication table of twos. They then count by threes from one to thirty-one, from two to thirty-two, and from three to thirty, thus learning the addition and multiplication tables of threes. In like manner they continue until they count by tens. If subtraction is taught by the addition method, no subtraction tables need be learned, although both Tanek and Knilling had the children count backwards so as to learn the subtraction tables as well. There have been recent improvements upon this method, children counting first by tens and by fives, and then by the other numbers to ten. The counting method has much to commend it if not carried beyond the proper limits. There is no reason, however, for counting by any number beyond ten times that number, or twelve times

the number if the multiplication table of twelves is to be learned. It is a fact that adults do not visualize numbers of any size, a name like "forty-seven" being merely a word in a series, representing four in a series of tens, plus seven in a series of units. In other words, we all use the series idea in dealing with numbers, and it is proper that the child, after he has learned to appreciate the meaning of the lower numbers, should do the same. Counting has the advantage of rhythm and of easily imparting the facts of the necessary number tables. If confined within reasonable limits, it is a valuable aid in the teaching of the elementary facts of number.

D. E. S.

#### COUNTY BOARDS OF EDUCATION. --

The County Board of Education, or its equivalent, is found chiefly in the South and along the Pacific Coast. West Virginia, Arkansas, Oklahoma, and Texas, alone of the states of the South Atlantic and South Central divisions, do not have a County Board of Education, though Arkansas and Texas have County Boards of Examiners, which perform some of the functions of County Boards of Education. Indiana, Iowa, and Missouri, alone of the Northern states; and California and Washington, alone of the Western states, have such a body. Minnesota has an *ex officio* board composed of county officers for unorganized territory only; Michigan and Oregon have a County Board of Examiners; and South Dakota has a County Textbook Commission. The terms County Board of Public Instruction, County School Commissioners, and County Board of School Directors, are sometimes used instead of County Board of Education.

The composition and method of appointment or election of the different County Boards vary greatly in the different states. In Iowa, Indiana, Virginia, and Kentucky, the County Boards are composed of *ex officio* county or school officers. The County Textbook Commission of South Dakota is a large and also an *ex officio* body. As with *ex officio* State Boards of Education, the powers and duties of these *ex officio* County Boards of Education are not very large. In Delaware and Maryland the County Boards are appointed by the Governor; in North Carolina they are elected by the legislature; in South Carolina they are appointed by the State Board of Education; in Georgia, they are elected by the Grand Juries; in Tennessee they are appointed by the County Courts; in Mississippi they are appointed by the County Superintendent; in Alabama, Florida, and Louisiana they are elected by the people; in Missouri one member is appointed by the County Court, and one by the State Board of Education; and in California and Washington, the members are appointed by the County Supervisors, or Commissioners. The Board of Examiners in Michigan, Oregon, and Texas are appointed by the County Superintendent.

No uniform practice prevails either with reference to the character or the qualifications of the persons elected or appointed. In California the law requires that a majority of the board members shall hold valid teachers' certificates; while in Louisiana the law provides that no teacher shall ever be eligible for election. In Washington the appointed members must all be experienced educators; while in the Southern states having elective boards, the members are usually lay members. In the Southern states, where the County Boards are elected or appointed, or are composed, *ex officio* of the head school officials of the county, they have been intrusted with much more important functions than is the case with the few County Boards of the North and West.

In the Southern states, the county system of school administration (*q.v.*) has in large part supplanted the district system, with the result that a strong centralized system of administration has supplanted the decentralized, and, in the South, extremely inefficient, district system of administration. It would not be possible to make any very substantial progress in the Southern states under the district system as found in many of the Northern and Western states. The common functions of the County Boards of Education in the Southern states are to divide the county into school districts, and to establish schools for the two races, as needed; to consolidate schools, and to transport pupils when deemed desirable; to employ all teachers, to fix their compensation, and to pay them their salaries; to acquire and hold the title of all school property, to keep the same in proper repair, and to purchase all school apparatus; to prescribe the branches of study, and to provide such graded and high schools as they deem necessary; to appoint a local representative, or trustee, for each school, to act as the representative of the board in each district; to determine the rate of county tax for schools; and, frequently, to elect the County Superintendent of Schools. The County Superintendent frequently acts as a member of, and more usually as the Secretary of the Board, and always as its executive officer. The future of the County Board of Education is not as yet definitely settled. With the centralization of power in the state these boards have recently lost some of their functions, such as the examination of teachers, the control of institutes, the adoption of textbooks, and the formulation of courses of study. On the other hand, the same tendency toward centralization has given the County Boards many functions formerly possessed by the school district authorities. With the tendency manifest on all sides toward the centralization of authority to secure efficiency, there is every prospect that more states will adopt the plan, and that the County Board of Education will in time become a strong and a useful body.

The success of such boards depends in large

measure upon a clear differentiation of legislative and executive functions, and on the personnel of the board and the executive officer it selects. In a supervisory capacity, County Boards have seldom proved themselves to be of much service. If composed of teachers who are engaged in teaching themselves, they are too busy; if composed of laymen, they do not know enough about school work to keep from constant blundering. The best service will always be obtained from such bodies by giving them large legislative functions only, and the choice of properly qualified administrative officers to carry out what they decide. The principles underlying good city school administration apply equally well to county administration. Where it is composed of teachers, the board is useful chiefly in assisting the County Superintendent in conducting the examinations of pupils and teacher, in formulating a course of study for the schools, and in making rules and regulations for the government of pupils and teachers. A board made up of teachers alone is very likely to be so conservative, and to act so continually along traditional lines, that no progress of the kind needed will be possible.

For a more detailed statement of the method of appointment, powers, and duties of the County Boards of Education in the different states, see the articles on the different state school systems, — as ALABAMA, ARKANSAS, CALIFORNIA, etc. E. P. C.

**Reference: —**

A Tentative Plan for a County Board of Education. *Bull.* No. 2, of the Illinois Educational Commission. (Springfield, 1908.) 53 pp. Tabulates conditions in the different states. Contains a good bibliography of thirty-five titles.

**COUNTY BOARDS OF EXAMINATION. —**

See EXAMINATION BOARDS.

**COUNTY SUPERINTENDENT OF SCHOOLS. —** See COUNTY SYSTEM OF ADMINISTRATION; SUPERINTENDENT OF SCHOOLS.

**COUNTY SYSTEM OF ADMINISTRATION. —** A form of school administration in which the county is the administrative unit, all school business, outside of the cities, being handled by a County Board of Education instead of district boards of trustees. (See article on COUNTY BOARDS OF EDUCATION for an outline of the functions and duties of such boards under the county system of school administration.)

Advancing from the district system of school administration (see articles on DISTRICT SYSTEM, DISTRICT MEETING, and DISTRICT BOARDS OF TRUSTEES), with all of its evils and defects, we have first the town system (*q.v.*) of Massachusetts or the township system (*q.v.*) of Indiana; then as a further advance the division system (*q.v.*) of Kentucky; and then the

county system, as exemplified in the school systems of Florida, Georgia, Alabama, and Louisiana. (See articles on the state systems in these states for detailed accounts.)

Under the county system all of the schools of the county, — not organized under a separate city or independent district system, under a board of education of its own, and having a special supervisory officer appointed by its special board, — are placed under the control of a County Board of Education, of from three to five members, elected or appointed, varying in this in the different states. A desirable plan is a County Board of Education of five members, elected by the people of a county, either at large or from County Commissioner or County Supervisor election districts, and only a part going out of office at any one time. This board represents the people, and is responsible to them, but the board, and not the people, selects the County Superintendent of Schools and the teachers, and performs the executive functions which the people at present attempt to perform in so many states.

The county system of administration centralizes and standardizes the schools of a county, largely eliminates the local quarrels and friction which so often play havoc with the working of the schools, does away with the incompetent management on the part of elected trustees, makes it possible to secure adequate and professional supervision, and insures better educational returns for the money expended. In effect, the county system merely applies the well-established principles of good city school administration to the conduct of country schools. It raises the work of the County Superintendent of Schools from a political and a clerical status to that of an educational expert, selected and retained because of personal efficiency, and it applies the business methods of large business concerns to the conduct of the educational business of the county. If five men are able to handle successfully and efficiently the educational affairs of such a city as Boston, with nearly three thousand teachers employed, and an annual expenditure of nearly four millions of dollars, it does not require three trustees for every little rural school to maintain a county educational system. The schools of the county would be much better managed, both from a financial and an educational point of view, if they were controlled and managed by a central board with a sufficient force of executive and clerical assistants. E. P. C.

**COURSE OF STUDY, THEORY OF. —**

The course of study may be considered from two quite distinct points of view. On the one hand, we may accept the curriculum as it obtains at a given time, and consider how each constituent study may be treated so as to make it most effective; what materials are available and what methods of presentation

and enforcement are most successful. Arithmetic, geography, history, reading, spelling, and all the studies may be thus treated. The results constitute a very important part of pedagogy or educational doctrine. Treatment from this practical point of view may also be extended to take into account the arrangement of these studies from the standpoint of the working school program, their proper grouping simultaneous and successive, the allotment of time to each study, the alternation of study and recitation periods appropriate to each subject, etc.

On the other hand, there is the philosophical theory of the Course of Study. From this standpoint, the problem does not grow out of accepting the currently established curriculum and asking how it may be perfected in efficiency, but centers about the ground and justification of any body of subject matter, and the reason for being of each constituent ingredient as a special means, or division of labor, for fulfilling the function of subject matter as a whole. (See PHILOSOPHY OF EDUCATION.) However, it is neither necessary nor advisable to draw a sharp line between the more concrete or practical point of view and the more theoretical problem. In a transitional time like the present there is no absolutely fixed and established body of subject matter. From the practical standpoint certain subjects are relatively retiring from the field; new subjects are being introduced or are clamoring for recognition. A generalized conception of the function to be served by the subject matter of education, of the various phases and factors of this function, and of the relation of various types of study to these different factors, can hardly fail to throw some light on the problems of the conflict and respective claims of various studies. Questions of the practical adjustment and sequence of studies and topics also run into problems of correlation (*q.v.*), concentration (*q.v.*), and isolation, which have some philosophic basis and bearing. In this article, the philosophic aspect of the course of study is considered, and with reference to the following problems: (1) the significance of subject matter in general; (2) its relation to experience; (3) its classification.

1. Viewed externally, the various studies present many independent collections of facts and general principles, each of these collections having its own distinctive logical basis and organization. Some of the studies represent forms of skill or of special ability to be acquired, — reading, writing, drawing, etc. Regarded in this external way, there is a great gap between the experience of the pupil and the subject matter which he studies. Three points of contrast may be noted. The child's experience is intensely social and personal. Every parent and every teacher knows that children naturally respond with a personal association to any incident or fact; what cannot be translated into terms of something which they them-

selves have done, or something that is connected with the activities of their friends, is not comprehended, or leaves them cold and indifferent. Experience centers about persons; things that are noted and recalled are things that play some part in the lives of persons. The material of studies, on the other hand, is impersonal and objective. It extends beyond the little world of persons with which the child is acquainted; it ignores all that is peculiar and precious to each individual. Over against the limited but social field of familiar friends, studies introduce the external world, infinite in space and time. In the second place, there is a striking contrast between the fluid continuity of children's experience and the hard-and-fast subjects of the curriculum. The child passes quickly and readily from one incident, one place, one idea, to another, and each blends insensibly into the other. He is absorbed in the present, and the present melts vaguely in indefinite vistas. His world is too fluid to permit of sharp separations or isolations. There is not even a dividing line between man and nature, to say nothing of between various phases of man's activities and various aspects of nature. The specific studies that form the curriculum represent this dissolving unity precipitated into detached and rigid subjects. Its world of experience is partitioned off into independent compartments. The unity of life appears simply as an aggregate of separate parts, such as arithmetic, geography, astronomy, physics, etc. Finally, the connecting links of direct experience and of a study are of radically different sorts. Affections, sympathies, inclinations, interests are the axes which hold together the diversity of fact and episode of ordinary experience. In a subject of study, facts are torn away from this primitive matrix, and are classed in a new way on the basis of a principle which is abstract and intellectual. The meaning of facts consists no longer in what they are worth to a person, but in the capacity of one fact to stand, impartially and objectively, for another. The classes, the genera, of natural experience are things that *feel* alike or that have the same value; studies present groups of facts that may be logically derived from a common principle.

These three contrasts, the personal and narrow world of the child and the impersonal and indefinitely extended world of the studies, the fluid continuity of experience and the specialized divisions of the curriculum, the practical and emotional ties of life and the logical basis and system of subject matter, define the problem of the significance of subject matter. *The studies represent selections* and formulations of what is regarded as most important in the experience of the race, and hence most necessary to transmit for the sake of the future of society. Subject matter is to be regarded from a social point of view. Every human group, at every stage of development, from the tribes of savages, to the national states of the present day,

has certain customs and manners of living, with which are associated certain forms of skill, trained ability, accumulated knowledge, and practical and moral aims. To habituate the young to these customs, to discipline them in the acquired modes of skill, to inform with the knowledge possessed, and, above all, to permeate them with the current ideals, is necessary to the conservation of the type of social life in question. When community life is simple, the function of transmission is performed by personal contact and intercourse and by the sharing of the young and old in common activities. But as associated life becomes more complex, it becomes more and more impossible to secure the requisite continuity of institutions by such informal means. As the tribal traditions become richer and fuller, and the technique of the arts, industrial, military and magical, more elaborated, division of labor occurs, and certain persons are set aside, as it were, to attend particularly to these things and to their perpetuation. These persons become the instructors of the community, and through them certain bodies of knowledge and belief and certain modes of skill are more or less differentiated and isolated. Instead of existing in solution, as it were, in the ordinary experience of the members of the community, they are precipitated. The need of special instruction going along with specialized legends and activities is probably the chief motive force in compelling self-conscious, reflection upon naïve and customary experience. Instead of the development of sciences leading to instruction, the demand for instruction led to the selection and formulation into definite bodies of subject matter of achievements and traditions that had previously been carried by the main stream of direct social intercourse.

It is not intended to trace the historic process by which out of these early crude condensations of various forms of tribal custom, belief, and skill, our present curriculum has been built up. Reference to the simple and more primitive types of education is here made because of the light thrown upon our problem of the significance of subject matter in general. This reference enables us to see that, fundamentally, geography, history, arithmetic, grammar, physics, etc., do not exist as studies simply for the sake of affording material of discipline or of intellectual improvement or general culture to pupils, nor because knowledge is inherently desirable in the abstract, but because there are certain values, activities, purposes, and beliefs currently existing in social life which absolutely must be transmitted to the succeeding and immature generation if social life itself is not to relapse into barbarism and then into savagery. On its face, geography is so much systematized knowledge about the earth. Fundamentally, however, it does not enter into the course of study just because of the objective facts themselves, but because of the rôle these facts play in the social organization and intercourse of a people. The

same holds true, in its own way, of each factor of the course of study. Summing up, we may say that the significance of the subject matter that forms the material of the course of study is to present phases and results of community life having such typical value that it is necessary to insure their continuous transmission.

2. What is the relation of this subject matter to the ordinary, immediate experience of pupils? It is to be noted that when we consider the course of study from the social point of view, we gain a notion of this relationship, which is very different from that entertained when, as is too common, we regard it from a purely intellectual, or logical, point of view. If the course of study is regarded simply as a body of material which has its significance in itself (whether as pure objective information or as a collection of modes of technical skill), the three antitheses already mentioned are much accentuated. It is difficult to discover points of natural community and transition between the everyday experience of children, their activities, purposes, and methods of cognition out of school, and the elaborate intellectual subdivisions and systems of abstract bodies of knowledge regarded as ends in themselves. But if we treat the organized subject matter of textbooks and formulated curricula as indications of socially important results to be employed not as self-sufficient ends of learning, but as stimuli to the progressive induction of pupils into a richer and fuller life, the situation is quite different.

The experience of pupils is already more or less socialized. It has been built up through suggestions and interpretations derived from the social groups of which the child is already a member. It is already saturated with social values that are akin to those presented in the studies of the curriculum. When taken statically and in cross-section, these studies are ready-made; they are hard-and-fast classifications. But if we take them historically, we find that they are gradual growths and precipitates of the experience of the race. The race also began with a crude immature experience, and out of this condition has gradually evolved the richer and more exact experience represented in the course of study.

Since, therefore, these studies are social products of the same sort of powers and conditions that are now found in child experience, there must be many points of kinship and contact between them and the present embryonic experience of the child. The primary business of education is to discover these points of likeness, and to make them the starting points of a guided development. The child's present experience and the subject matter of instruction, instead of existing in two separate worlds, one wholly psychological, the other wholly logical, represent two changing or dynamic limits of one continuous social process.

Looking at the problem from the side of the child, we find that his experience is not a static

or finished thing needing to be stimulated to grow from without. It is transitive, full of motives and outreaching forces that compel its own modification and reconstruction. It is self-transforming, so that the problem of education is not to engraft foreign and remote material upon an indifferent, passive person, but to supply an environment which will direct the changes that are bound to occur anyway toward the desired social result. (See EXPERIENCE for the further development of this topic.)

3. Classification of Studies. — What has been said indicates a convenient and fruitful principle for classifying the subject matter of instruction. First come those studies which, looked at from the standpoint of the child, are not studies but modes of social activity and experience, and which, looked at from the standpoint of the educator, are typical embodiments of social values that represent important ends to be attained in instruction. Elementary education has already included within itself (for a variety of reasons) such activities as gardening, cooking, sewing and weaving, constructive work in paper, leather, wood, metal, care of animals, excursions, singing, story telling, dramatizations, drawing, painting, designing, sand molding, clay modeling, plays and games, etc. These modes of activity are not psychological merely; they do not simply appeal to and express the more native and spontaneous impulses of children; they also present important social processes; they typify occupations that are indispensable to the continued existence of community life. Moreover, as processes they condition intelligent study of social products. (See CULTURE EPOCH THEORY.)

Probably the main motives for introducing these activities into the primary curriculum have been psychological and utilitarian, rather than any conscious perception of their value as social types. That is to say, they have made their way because children were found to be interested in them, because they furnished devices for teaching the three R's more easily, because they afforded relief and recreation from more severe intellectual studies, and because they seemed to prepare children for the later business of making a living. For this reason, they have been inserted into the curriculum, or superimposed upon other studies, without any particular transformation of other studies, or any organic connection with them. They have been for the most part simply additional school studies. It remains to utilize them systematically as foundation stones for the other studies by teaching them as representatives of these social activities which are fundamental to the knowledge and modes of skill embodied in these other studies.

History and geography (including, for convenience, nature study under the latter term) are the members of our second group. They are to be considered as the *background* of the direct social processes exhibited in the group

just considered. History sets forth the temporal background; the evolution of the gradual control of the activities by which mankind has enriched and perfected its experience. From the pupil's standpoint, the direct activities in which he engages lead constantly out into this historic field. Children must begin naturally with simple operations, whether in cooking, weaving, woodwork, or whatever. These simple operations agree of necessity in their main features of crude material and simple tools and technique with the operations of men in the less developed, the earlier, periods of social life. In their contrast with the elaborate complicated products and machinery of contemporary occupations, they present the problem of the historic step by which the gap has been bridged. They introduce questions regarding the social effects of the industrial activities they typify, and the nature of the inventions by which the progress of society has been effectively secured. They lead, in other words, not only to the economic history of mankind, but to the political and scientific history associated with man's economic development.

On another side, these activities necessitate consideration of the natural background, a study of the globe from which materials are drawn, of the various plants, animals, minerals, etc., that supply the raw material, and the various conditions, climatic, physiographic, etc., under which these materials originate; they also require study of those physical and chemical energies that are involved in the tools and operations employed. In the history of the race, the sciences have been slowly developed out of practical necessities — anatomy and physiology out of sickness, accidents, and the need for keeping well; botany out of agriculture and the search for medicinal remedies; physics out of mechanical devices for getting results more economically and on a large scale; chemistry out of dyeing, metal working, the refining of crude natural products; geometry out of measuring land, erecting buildings, etc. The natural differentiation of studies with pupils follows the same general sequence of evolution.

There are also found in the curriculum various studies and aspects of studies that represent technical skill and intellectual or logical methods in the abstract, *i. e.* on purely intellectual grounds. From the standpoint of our fundamental criterion, the social, these abstract and technical methods signify the instrumentalities by which complex and progressive communities are maintained in being. From one standpoint, mathematics is a pure science, organized on logical grounds for the sole sake of the perfecting of knowledge. From another point of view, mathematics represents an absolutely indispensable organ, or method, of any social life that rises above barbarism. In like fashion, written and printed language, while, on its face, a purely symbolic device for the recording and communicating of thought and objective

information, is, in its concrete setting and function, a device of social life. Oral language is transitory; it leaves behind itself no permanent deposit. Where it alone has been achieved, social development is restricted to what can be carried by personal memory and communication. When written and printed symbols came into use, the net results of the past could be economically conserved, their transmission was facilitated, and they themselves were emancipated, by their symbolic or abstract representations, from all sorts of local and irrelevant associations. Generalization and organization of future activities were rendered possible. Now it follows, it goes without saying, that the educational significance and motivation of the studies that have to do with the mastery and use of symbols should be based, not upon their purely theoretical values, but upon their value as social methods and instrumentalities. This mode of approach is secured in the degree in which this class of studies is organically connected with the two classes previously described. While the reaction in the elementary curriculum against the domination of the "three R's" has proceeded practically and unconsciously in response to specific exigencies, its philosophical justification lies in the fact that it recognizes that studies dealing with formal or symbolic materials have to be motivated and led up to through educational content of a more direct and social character.

The scheme of classification indicated makes no provision for literature and the fine arts. Art — in the aesthetic as distinct from the technical and industrial sense — is to be regarded as a perfected expression of any crude or primitive mode of activity which has gained a recognized social value. It is essentially a *consummation*, a refinement and idealization of what is originally done and acquired from more direct and practical motives. It represents the end to which all other educational achievement should tend — its perfected goal. J. D.

**COURSES OF STUDY, or COURSES OF INSTRUCTION.**—A graded outline of the subjects of instruction, the order to be followed in pursuing them, and the amount of each to be completed in definite portions of time. Such an arrangement of studies is usually called a graded course. A daily arrangement of work in the different studies is called a *program*.

**The Prescription of Courses of Study.**—There is great divergence in the different states, counties, cities, and towns in the means by which courses of study are determined and in the amount that is prescribed by authority from above. Rhode Island, with nothing required but temperance physiology, and the maintenance of a high school or the provision of high school tuition, stands almost alone among the states in the absence of requirements. Almost everywhere certain statutory studies are enumerated in the school law, and districts are permitted to add other studies to those required to be taught, if they have the money to provide the extra instruction and the time in which to impart it. Almost everywhere the school law of the state requires that instruction shall be given in reading, writing, spelling, arithmetic, geography, and history of the United States. These studies are prescribed for all schools alike, and have been common requirements for years. Most states require also that all schools shall be taught in the English language, though in states where large numbers of Germans are found instruction in the German language for a part of each day has been authorized as a necessary concession to the German people. Similarly instruction in the French language has been authorized in Louisiana. Some of the Southern states require instruction in the history of their state, and a number of the Western states have recently added instruction in the elements of agriculture. Morals and manners, physiology and hygiene, and civics are required by a number of states, and music, drawing, elementary bookkeeping, humane education, domestic science, and manual training are also named as either optional or required studies by a few others. Even when named as required subjects in the law, such requirements are seldom stated otherwise than in the most

general terms, and the different school administrative units are left free to work out the details of such instruction in such form, and to provide the instruction only in such grades, as they see fit.

An exception to this rule is found everywhere in the case of temperance physiology. This most definite and compulsory requirement has been added to the list of required studies in every state and territory since 1880, as the result of the efforts made for it by the Woman's Christian Temperance Union. As generally stated, the statutes require that "the elements of physiology and hygiene, with special reference to the effect of alcohol and narcotics on the human system, shall be taught to the pupils of each grade of the public schools." In many states the teachers are required to state on oath that they have given the instruction as required by the law. (See article on TEMPERANCE, INSTRUCTION IN.) So long as the state merely enumerates the subjects of study, and leaves to the school units the working out of the outlines of instruction, such enumeration of statutory studies does not mean much. The old fundamental school studies would be taught in the schools if no statute requiring it existed. For such studies as music, drawing, manual training, and domestic science their enumeration in the statute does exert a certain amount of pressure, but the nature and the extent of the instruction is still left to the school units to determine. When the state, or the county, adopts a series of uniform textbooks for use in the schools, a new force tending toward more uniform and obligatory instruction is put into operation; and when the state, or the county, goes still further and issues an outline of work to be followed by the teachers in the schools, the force operating toward uniform instruction is greatly increased. A few states have outlined state courses of study, but county courses, with freedom to the cities, are much more common.

**State Courses of Study.** — Such courses are generally outlined by the State Board of Education or the State Superintendent of Public Instruction, though in a few cases a State Commission has been created, and in one state the State Teachers' Association has been the active body in working out the course. Such courses are based on the statutory school studies and the state series of textbooks, if such exist, and try to outline the minimum quantity of work for each school year. Outlines of courses of study for high schools are frequently included, and sometimes the accrediting of high schools is made dependent on the use of one or more of such high school courses. The outline usually is not in great detail, and leaves room for local options and initiative in carrying out the course. Not infrequently the state course of study issued is advisory rather than compulsory; the state courses of study issued by the State Boards of Education in Indiana and Massachusetts are

examples of such. In New York State the uniform effect of a rigid state course of study is produced by the system of state examinations, conducted by the State Department of Education at Albany, and by the issuance of syllabi of instruction upon which the examinations will be based.

Some examples of compulsory state courses may be mentioned. In Arkansas the State Superintendent of Public Instruction is directed by law to prepare an outline course of study for the schools; but as he is prohibited from referring to any textbooks, the course of study issued must be general and flexible. Oregon and Washington have state courses of study, the use of which is compulsory, except in the larger cities. North Carolina, Tennessee, and Maryland have state courses of study, the use of which is compulsory throughout the state, except in the largest cities. In Utah a law enacted in 1907 created a state commission, consisting of the Superintendent of Public Instruction, the Principal of the State Normal School, the Principal of the State Training School, and two county superintendents to be appointed by the State Board of Education, to meet, formulate, and prescribe a state course of study, which must then be used by all schools except county school districts of the first class, and cities of the first and second class.

(See special articles on the different state school systems.)

There is a tendency, though not marked as yet, for the states to take the matter of outlining courses of study upon themselves and away from the counties. So long as the course outlined represents minimum requirements and is flexible, the good that comes from such uniformity more than counterbalances any tendency toward dead uniformity. Detailed and specific requirements would prove more harmful than beneficial. The best progress has been made by leaving communities free to go beyond the average of work about them, and this right should always be maintained.

**County Courses of Study.** — County uniformity in courses of study is much more common than state uniformity. Outside of New England, where the county is not used as a unit of school administration, county uniformity, in some form or other, is found in practically every state not following a state course of study. In the Northern and Western states, cities of any size are exempted from following the county course of study, and in the Southern states the larger cities and the locally independent systems are likewise exempt. The cities in such cases are free to form their own courses of study, though cities and counties alike are required to include the statutory studies. Where the County System of School Administration (*q.v.*) prevails, as in certain Southern states, the county course of study naturally follows and is binding on all schools except those organized under special laws. Where a partial county system

prevails, as in the Western states, the county course of study is likewise found, and usually applies to all schools of the county except cities organized under boards of education and employing a superintendent of schools.

County courses of study are usually prepared by the County Board of Education, if such a body exists in the county, or by the County Superintendent, if there is no County Board. Often committees of teachers act unofficially in an advisory capacity. County courses of study, intended as they are for the use of rural and village teachers, are usually made out and printed in some detail, and the annual county examinations for promotion and graduation are based on the proper completion of certain portions of these outlined courses. In New England the town, or group of towns, where supervisory unions exist, is the administrative unit which outlines the course of study.

**City Courses of Study.** — Large cities practically everywhere have freedom to arrange their own courses of instruction and in their own way. While including all of the statutory school studies, and in about the same order as the rural and village schools, the work is done much more extensively and intensively, and calls for a different form of outline for the guidance of teachers. City courses of study are usually printed in much more detail, and many of the courses of study issued by the larger cities are elaborate and carefully worked out documents, the result of much careful work and much accumulated experience.

In the smaller cities the Superintendent of Schools usually prepares the course of study, and the Board of Education formally adopts it for use in the schools, though in many cities a committee of the Board of Education on course of study attempts to do what the laws generally give it the legal right to do, but which it is no longer competent to handle. In the larger cities the Superintendent and his assistants prepare the course of study, usually after conferences with committees selected from the teaching force, and the course is promulgated by the Superintendent and altered as necessity arises. In cities having a modern organization the right to formulate the course of study is guaranteed to the Superintendent and his assistants by the organic law for the city. E. P. C.

**England.** — There is no prescribed course of study for elementary schools in England. Each principal may draw up his own syllabus and time-table within the limits of subjects suggested by the Board of Education in the Elementary School Code. These are subject to the approval of His Majesty's Inspectors, who may, where they see fit, also approve of the inclusion of any subject not suggested by the board. The board does, however, issue *Suggestions for the Consideration of Teachers and Others*, which include specimen schemes or courses of study and discussions of methods. But these are merely by way of suggestion and

not prescription. The same practice of approving the curriculum and time-table as drawn up by the school principal is observed in secondary education.

**Germany.** — The practice in Germany is much the same as that in England, with the difference that the nature and extent of the subjects which are to be taught are definitely prescribed even so far as the time allotment. From this scheme only the larger towns vary. The course of study, as well as a diary of work done, are subject to inspection and approval.

**France.** — The course of study in France is rigorously prescribed by the central bureaucratic authority, and no subject may be added without its consent. The control is exercised through the Academy Inspectors. The tendency, at present, is to allow more local freedom and initiative, and the period, when the Minister of Education could look at his watch and say exactly what subject was being taught then throughout the country, is passing away.

See the separate articles on the various national systems.

**COURTIER, EDUCATION OF.** — See GENTRY AND NOBLES, EDUCATION OF; PRINCES, EDUCATION OF.

**COUSIN, VICTOR.** — The son of a watchmaker of Paris; was born in 1792 and died at Cannes in 1867. After a brilliant academic career, in which his love for music was shown and came near determining his future course of study, he finally decided to take up philosophy, largely as the result of the influence of Royer-Collard and Maine de Biran, his teachers. In 1815 he succeeded the former as professor at the Sorbonne, where he did much to promote the reaction against the sensualism of Condillac (*q.v.*). His system he himself calls eclecticism; but the influence of German idealism and Scottish realism are specially noticeable. He was a prolific and fruitful writer, and his career at the Sorbonne revived the halcyon days of Abélard (*q.v.*) and William de Champeaux (*q.v.*). So far as education is concerned, he, like many other teachers of the period of the Revolution, was chiefly interested in getting his fellow countrymen to reform the French system of public

instruction. He was for eight months (1840) Minister of Public Instruction under Thiers. Five years before (1835) he published his famous *Report on the State of Public Instruction*, a work which exercised considerable influence both in France and America at the time, and in which he shows, from the example of other countries, like Holland and Germany, that public utility necessitates the compulsory education of all children. His career was identified with the great struggle of France for civil and intellectual liberty, and the main purpose of his activity was to show that enlightenment and social progress are inseparable. He also aided in the work of reorganizing university instruction by his careful studies of educational systems abroad, especially in his two works, *De L'Instruction Publique dans quelques Pays de l'Allemagne et particulièrement en Prusse* (*Public Instruction in Germany*, 1833), and *De L'Instruction Publique en Hollande* (*Public Instruction in Holland*, 1837).

## COWLEY, ABRAHAM (1618-1667).—

Although best known as a poet, Cowley was the author of two interesting educational essays. About 1656 he wrote the *Plan of a Philosophical College or Proposition for the Advancement of Experimental Philosophy*, in which he combines the suggestions in Bacon's *New Atlantis* with those of Milton's *Tractate*. The college was to be founded with an endowment of £4000, but it would soon pay its own way, "for the industry of the College will in a short time so enrich itself as to get a far better stock," and owing "to the public benefit to accrue to mankind and chiefly to our nation," public liberality would continue. There were to be twenty professors, four of whom were to travel for three years into the four parts of the globe and send reports on "all things that belong to the learning and especially the natural experimental philosophy of those parts," and return with "books, simples, animals, stones, minerals, and metals." Emphasis was to be placed on the truth of the accounts. The resident professors were to lecture publicly and to study "all things contained in the catalogue of natural histories annexed to my Lord Bacon's *Organon*," and "every third year the college shall give an account in print in *proper and*

*ancient Latin* of the fruits of their triennial industry." To the college a school was to be attached, free and open to boys of thirteen. "A method was to be established for the infusing of knowledge and language at the same time to them and that this may be their apprenticeship in natural philosophy." Hence such of the classics as dealt with scientific subjects were to be read; in fact, the curriculum hardly differs from that suggested in Milton's *Tractate*, and has most of the features of the *Academics* (*q.v.*) which were then in the air.

In another work, *An Essay on Agriculture*, after dwelling on the advantages of that form of industry he advocates the establishment of one college in each university for this study, where the professors would not "read pompous and superficial lectures out of Vergil's *Elogues*, Pliny, Varro, or Columella, but instruct their pupils in the whole method and course of study," and the professors should be chosen "for solid and experimental knowledge."

Cowley had taken a great interest in the foundation of the Royal Society (*q.v.*), was an M.D. of Oxford, and wrote a poem in Latin, *Plantarum Libri Duo*, a work which shows his interest in scientific studies.

**COWPER-TEMPLE CLAUSE.**—The famous clause known by the name of its author, Mr. Cowper-Temple, M.P., which was inserted in the English Elementary Education Act of 1870, and frequently repeated since then. Subsection (2) of the 14th Section of the Act of 1870 runs as follows: "No religious catechism or religious formulary which is distinctive of any particular denomination shall be taught in the (public elementary) school"; that is, if any religious instruction is given in such a school, it must be undenominational in character.

See ENGLAND, EDUCATION IX.

**COWPER, WILLIAM** (1731-1800).—The poet, who throws light in some of his works on school conditions in the eighteenth century. Although himself of morbid and dependent temperament, his criticisms of the defects of the contemporary schools are frequently sound. He was unfortunate in his own school experiences, and accordingly in the poem *Tirocinium; or a Review of Schools*, he gives expression to the memories of his days at a private school and Westminster. The poem is dedicated in the following terms: "To the Rev. William Cawthorne Unwin, Rector of Stock in Essex, the tutor of his two sons, the following poem, recommending private tuition in preference to an education at school is inscribed." The chief indictment which Cowper brings is the lack of moral control and moral

training. If a boy shows brilliance at his books:—

"The pedagogue with self-complacent air,  
Claims more than half the praise as his due share.  
But if with all his genius he betray . . .  
Such vicious habits as disgrace his name . . .  
Though want of due restraint alone have bred  
The symptoms which you see with so much dread;  
Unenvied then, he may sustain alone  
The whole reproach, the fault was all his own."

In *The Task* Cowper continues the topic, lamenting the decline of *Discipline* and its effects.

**CRAMMING.**—A term used to describe a form of study which consists in memorizing hastily subject matter which the individual does not expect to retain permanently. Thus, a student prepares for examination a short time before the beginning of the test by learning the facts necessary to carry him through the brief interval. Criticism of this method of learning has frequently been made, and the criticism has sometimes been extended so as to include all forms of memory work. This extension of the criticism to cover all forms of memory work is not legitimate, since the essence of the process criticized is its lack of thoroughness. Furthermore, attention should be drawn to the fact that there is at times a practical demand in life for a brief retention of a mass of facts. The lawyer who prepares for a case learns a certain number of facts which he does not intend to retain permanently. The business man, undertaking a transaction, also equips himself with information which he does not intend to retain permanently. The ability to master for temporary use a large body of facts is, therefore, in some cases of value. In general, however, the work of the school is of a different type. Whatever is to be memorized should be memorized for the purpose of longer retention, and for the most part even mere memory work is not justifiable in education. H. S.

For a more complete discussion see article on MEMORY; MEMORIZATION.

**CRANIOMETRY.**—A division of craniology and a branch of anthropometry which studies by means of systematic measurements the proportions and geometrical characteristics of the human skull. It affords one of the chief means of racial classification in that the marked racial differences and individual variations of skulls may be measured with accuracy of detail. The first cranial measurements of note were made by Daubenton on the situation and direc-

tion of the *foramen magnum*, but it is now generally accepted that the first to write on craniometry in a scientific manner and to emphasize racial distinctions was Peter Camper who described the "Camper facial angle" in a lecture on art at the Academy of Fine Arts, Amsterdam, 1770. Among others who have contributed to the science are Morton, Thurman, Von Baer, Virchow, Flower, Broca, Ecker, Turner, Retgius, Bertillon, Welcher, and Topinard. Among the special forms of apparatus that have been used for craniometrical measurements are straight and sharp-pointed compasses, the ordinary anthropometric compass, Broca's stereograph and craniograph, diagraph of Gavart, diopter of Lucæ, Topinard's craniophore, craniometers, callipers, and cephalometers. The last three pieces of apparatus may be used on the living head as well as the skull. The most important measurements and characteristics in studying and comparing skulls are length, breadth, circumference, height, capacity, facial angle, degree of prognathism of jaw, facial index, form of the nasal skeleton, the orbital opening, and the form of the palate and dental arch.

The measurements of most general interest are those of length and breadth, which, when expressed in terms of per cent of the latter to the former, give a resulting complex value known as the *cephalic index*. The indices vary with the mode of measurement, but the points generally selected for determining the length, or antero-posterior diameter, are the nasion, globella, or ophryon in front, and the occipital point orinion behind. The width or biparietal diameter is the greatest transverse diameter above the supermastoid ridge. The resulting ratio would be  $\frac{100 \cdot W}{L}$ . When the per cent is low, the skull is long, and when it is high, short. Authorities differ somewhat in regard to the boundaries for each type of skull, but the following classification from Deniker is one of the best: dolichocephalic, less than 77; subdolichocephalic, 77 to 79.6; mesocephalic 79.7 to 81.9; subbrachycephalic, 82 to 85.2; brachycephalic, 85.3 to 86.9; hyperbrachycephalic, 87 and more.

There is a correlation between cephalic index and length of face, breadth of face, and stature. Boas has pointed out that while a cephalic index is a convenient, practical expression for the form of the head, it is not the expression of the law of direct relation between length and breadth of skull. "The relation between capacity and head diameters is found to be of fundamental importance, and among these the relation between transversal diameter and capacity is most significant. Since in measurements on the living we are unable to measure capacity of the head, it is necessary to find a substitute. It would seem that circumferences are the most available means for judging cranial size."

The circumference of the skull is taken in a horizontal plane through ophryon (sometimes)

through the globella) and the occipital point. In adults the average is about 52 cm. (20.5. in.) for males, and 50 cm. (19.7 in.) for females. Extremes of 17 inches (microcephalic head)

A, Alveolar Point; S, Subnasal point; N, Nasion; G, Globella; Op, Ophryon; Bg, Bregma; Ob, Obelion; L, Lambda; O, Occipital point; I, Inion; B, Basion; Pt, Pterion; St, Stethion; Gl, Glabella; NS, Nasal length; BN, Basinasal length; BA, Basialveolar length; NS, Nasal length.

and 26 inches (macrocephalic or hydrocephalic heads) are sometimes met with in cases of idiosy. The average at birth is from 38 to 42 cm. (Sach), or, according to Holt, 35.5 cm. (13.9 in.) for boys and 34.5 cm. (13.5 in.) for girls. Many other measurements are taken to determine more accurately the form of the skull.

The capacity of the skull, measured in many ways, offers some indications of brain development. Morton and Broca, filling the skull with small shot, measured or weighed the shot, to determine the cubical contents of the skull. Buck, Flower, Welcher, Tiederman, and others have pursued a similar method, using white mustard seed, pearl barley, small beads, etc. As a rule, skulls ranging from 1350 to 1450 cc. are mesocephalic (American Indians, Chinese); those over 1450 cc. macrocephalic (Japanese, Eskimos); and those under 1350 cc. microcephalic (Australians, Bushmen). There is no direct evidence that the size and shape of the skull are closely related to intelligence, but there are limitations beyond which the relationship is quite apparent. This is noticeable among many types of mentally deficient children.

There are four principal facial angles which may be seen in the accompanying diagram. The angle of Camper is the oldest. The angle of Geoffrey Saint-Hilaire and Cuvier (1795) has been abandoned. The angle of Jules Cloquet (1821) is a mean between the preceding two, and is probably the most important. The angle of Jacquart is the fourth.

In general, the facial angle serves to indicate the prognathion of the upper jaw, which is

significant in the anthropological classification of races. When the index is above 103, the skull is prognathous; when below 98, orthognathous; when between 98 and 103, mesognathous. The facial index is the relation of the breadth of the face to the length. The length is usually taken from ophryon or nasion to the mental point. The long face, or dolichofacial, has an index below 90, and the brachyfacial above 90. When the lower jaw is absent, the superior facial index is taken, and 50 is used in place of 90, the length being taken from nasion to the alveolar point. The nasal index is of much value, since there is little difference in size and shape between that of the skull and the living head. The height is measured from the nasion to the subnasal point, and the greatest transverse diameter of the anterior portion of the nasal aperture is taken as the width. Skulls with an index below 48 are leptorhine; from 48 to 53, mesorhine; and above 53, platyrhine. (Quain.) The orbital indices are of less value for racial comparisons. The forms of the palate and dental arch are compared for the palatal-maxillary index. The alveolar index (Flower) is the ratio of the length from the basion to the alveolar point, to the length from basion to the subnasal point or nasion. Many other diameters, angles, and indices have been

III', Horizontal of Camper; FF', Facial line of Camper; FAH, True angle of Camper; FBK, Angle of Geoffrey Saint Hilaire and Cuvier, its vertex at the edge of the incisors; LCM, Angle of Jules Cloquet, its vertex at the alveolar border; ODH', Angle of Jacquart, the sub-nasal point; OD, Facial line of Jacquart. (Topinard, P., *Anthropology*, p. 41, London, 1890.)

marked with more or less uniformity for purposes of anthropological and craniological investigation. B. T. B.

**CRATES OF MALLOS.** — A grammarian of the second century B.C. He was head of the Pergamene Library, which was founded by Eumenes II. It is probable that he was responsible for the lists of authors drawn up for the library and the prominence given to prose authors, especially orators. He wrote an allegorical and a critical commentary on Homer; some notes on Hesiod, and commentaries on Euripides and Aristophanes. In thought he belonged to the Stoic School of grammarians, and followed the view of Chrysippus that language was based on irregularity, the view of the anomalists, as against the view of Aristarchus and the Alexandrines that it is based on regularity and analogy. Crates founded a school of which Panætius, the Stoic philosopher, was the most eminent pupil. At some time between 169 and 159 B.C. Crates visited Rome, and, being detained there as the result of an accident, he seized the opportunity to give lectures on formal grammar and literature, and was influential in arousing an interest in literary study among the Romans.

**CREATIVE SYNTHESIS.** — This term is employed by Wundt (*Outlines of Psychology*) to indicate that the processes of apperception result in forms of thought which are in no wise explained by the elements of which these thoughts are composed. By combining the elements of experience a new product is put forth which is higher in its type than any other elements. Thus a work of art is a product of creative synthesis. An invention is a creative synthesis.

**CRESCENT COLLEGE FOR WOMEN, EUREKA SPRINGS, ARK.** — A school for girls and young women. Primary, preparatory, academic, musical, and art departments are maintained. Degrees of Bachelor and Master of Arts are granted.

**CRETE, EDUCATION IN.** — A melancholy interest attaches to the island of Crete, which shared in the glory of Greek civilization and in the ruthless splendor of Venetian rule before it fell under the Ottoman power, which held sway for four and a half centuries (1221 to 1660). Rescued from alien despotism and internal insurrection by the intervention of the four powers, Crete was constituted an autonomous state in 1898, subject nominally to the suzerainty of the Sultan. Through the right granted to the King of Greece in 1906, to propose the High Commissioner, the island has finally recovered political relations with Greece. It comprises, in an area of 3365 square miles, a population of 310,185. Of this number 269,848, or 87 per cent, belong to the Greek Church and are Hellenistic in traditions, sympathies, and tendencies. The Mohammedans, who are mostly Greek converts or their descendants, number 33,496, or 10 per cent of the population; the remainder are Jews and foreigners.

In accordance with the constitutional provisions, public instruction forms one of the five departments organized for the administration of public affairs; but as a consequence of the conditions which prevailed during the long period of Turkish rule, education is practically under church control. The Greek Church is represented by a Metropolitan, whose see is at Candia, and seven bishops, who keep careful watch over the religious training of the children. Secular instruction is assimilated to the system which prevails in Greece. Primary education, which is by law compulsory for all children six to ten years of age, is provided by parish schools, of which the large majority pertain to the Greek Church. There is freedom, nominally at least, in religious matters, and the Mohammedans conduct their separate schools without interference; but the laws require that there shall be at least thirty Mohammedan children for every public school teacher of that faith. Official statistics for 1907-1908 give a total of 640 primary schools. As regards religious affiliations, 621 of these schools were Christian, that is, pertained to the Greek Church. They had a total of 36,149 pupils (27,714 boys; 8435 girls). The remaining nineteen schools, with an enrollment of 1957 pupils (1213 boys; 744 girls), pertained to the Mohammedan faith.

The institutions for secondary education comprised four complete gymnasia, four gymnasia of inferior order, and twenty-one progymnasia, all modeled after German types. (See GERMANY, EDUCATION IN.) They enrolled 4174 pupils, of whom 435 were girls, and employed 75 teachers. For higher education, Cretan students repair to the University of Athens or to other Continental institutions.

The government contributes for the support of schools about 750,000 drachmas (\$144,750) annually.

**CRETINISM.**—A form of low-grade imbecility or idiocy, either endemic or sporadic, characterized by a peculiar stunting of growth and associated with the absence or disease of the thyroid gland. It is endemic in widely scattered localities throughout the world, but occurs most frequently in certain valleys and slopes of mountainous regions of Europe—in Switzerland, France, Spain, and Italy. Such an endemic has been reported in this country in certain parts of California, Vermont, Minnesota, Ontario, and elsewhere. The causes are not well understood, but are thought to be due to unhealthy conditions arising from the climate, soil, or water supply, coupled with the likelihood of some accumulation of hereditary weaknesses such as might, for example, arise through intermarriage in isolated communities.

Sporadic cretinism (cretinoid idiocy) is a relatively rare condition, due to the absence of the internal secretion of the thyroid gland. "The symptoms of cretinism in most cases make their appearance during the first year, but are sometimes so slight as not to be noticed until the seventh or eighth year. The general appearance of the cretin is striking, and so characteristic that when once seen the disease can hardly fail to be recognized. The body is greatly dwarfed, and children of fifteen years are often only two and a half or three feet in height. All the extremities, the fingers and the toes, are short and thick. The subcutaneous tissue seems very thick and boggy, but does not pit upon pressure like ordinary oedema. The facies is extremely characteristic. The head seems large for the body; the fontanel is open until the eighth or tenth year, and it may not be closed even in adults; the forehead is low and the base of the nose is broad, so that the eyes are wide apart; the lips are thick, the mouth half open, and the tongue usually protrudes slightly; the cheeks are baggy, the hair coarse, straight, and generally light-coloured. The teeth appear very late . . . and are apt to decay early." (Holt.)

The condition is one of mental and physical enfeeblement; walking and speech are acquired late, and "when fifteen or eighteen years old the cretins appear like children of two or three years." Emotionally, they are good-natured, seldom troublesome, and may show some affection. The treatment of sporadic cretinism, as of myxedema in general, by use of the thyroid glands of animals, furnishes one of the most brilliant chapters in medicine. "In acquired or operative myxedema thyroid feeding may be considered established as a curative treat-

ment. In cases of myxedematous retardation, its results appear equally brilliant. In sporadic cretinism it is capable of producing the most marvelous improvement, which is complete in proportion as it is adopted early in life. In endemic cretinism its effects are beneficial, but as yet its proper value is not established." (Church and Peterson.)

The chief difference between the sporadic and the endemic seems to be one of degree, physically the only distinction being the presence of the goitrous enlargement in the former. "The isolated examples of cretinism that are now found in this country and in England can hardly be called true cretinism, as lacking its intensity of coarseness and stupidity. These are, therefore, better classed as demi-cretins or *cretinoids*." (Barr.)

**CRIB.**—A colloquial expression for a theft. Hence, in common usage, anything used or copied by a person without due acknowledgment to the author. In college slang, any copied material used to cheat with in a test, recitation or examination. A "pony," or literal translation of a classic author, becomes a "crib" when used against the wishes of the teacher of languages. The term is also used in English school slang to refer to the person who "cribs."

See HONOR SYSTEM.

**CRICKET.**—The national game of Great Britain. It is played in every part of Great Britain and all the British colonies. Like other modern ball games, cricket has been developed from simpler games in which the characteristic was to strike a ball with a stick. The essential features of the present game have been traced to the game of *creag*, played in England during the thirteenth century. As in football, many efforts were made to suppress cricket. Edward III declared it unfit for any but the lower classes, and Edward IV made it illegal. In 1748 it was declared by law that cricket was "a very manly game, not bad in itself but only in the ill use of it by betting more than ten pounds on it." It soon became very popular, and was played by all classes, and by the end of the eighteenth century it had become the national game. Cricket is played by practically all students in every educational institution, from the elementary school to the university. It is played on a very smooth grass field by teams consisting of eleven players. The ball used is of cork bound with string and covered with cow-hide; it weighs four and a half ounces and measures nine inches in circumference; the bat

is thirty-eight inches long and four and one-half inches wide.

Many eminent educators, physicians, and statesmen have written on the value of cricket as a factor in physical and moral education. A great advantage of cricket is that, like golf, it may be played by young and old. Most of the American school and college sports are so violent that few of them can be indulged in by men in middle life, with the result that exercise is neglected by American men soon after they leave college. Not so with Englishmen, who continue to derive beneficial exercise and recreation from cricket practically all through life.

Cricket has never flourished in the United States, outside of a few clubs made up largely of Englishmen. At Harvard and a few other colleges cricket teams have been maintained by English students, but there is no indication that the game will be taken up by American students. The great popularity of baseball is undoubtedly responsible to a large extent for the lack of interest in cricket by the American students.

**CRIPPLED CHILDREN, EDUCATION OF.**—**Germany.**—The first attempt to educate crippled children in schools especially adapted to them was made in 1832 by Mr. Kurz, a citizen of Munich. He had observed the sad lot of the crippled children in the common schools, where they were the butt for the jokes of the healthy scholars. He had observed, also, the condition of the crippled children when, upon leaving school, they must choose an occupation. Then, as now, trades which required physical strength were closed to them.

In addition, the superstitious fear that these poor unfortunates would bring bad luck prevented their being taken into homes where lighter employment might have been found for them; so there was nothing left for them but to become a prey or burden on society. Mr. Kurz's plan was to give the crippled children a specially good education and an opportunity to learn a trade with which they could earn a livelihood. The Kurz Foundation had in the beginning many difficulties to contend with. However, King Ludwig I of Bavaria took an interest in the school for cripples, and transformed it into a state institution, thus making it independent of persons and securing its existence for all time. The Munich school for cripples was a model for nearly all the later foundations which have been created in Germany during the last century. It is a peculiarity of this school that its pupils receive not only instruction, but also food, clothing, and lodging. They are taken from the parental home, and return to the family only for a few months during the vacation. In the Munich state institution pupils are first admitted between the ages of eleven and fourteen, and remain for three years. The board of a crippled child for the three years amounts to 1400 marks. That the instruction is well-planned, giving the children a really definite education, is seen from the fact that out of the pupils who attended the Munich Institute from 1877 to 1902, 90 per cent were able afterwards to earn their livelihood. In Germany there are in all thirty-nine institutions, with 3371 beds; but the number of crippled children in the whole of Germany is 98,263. One of the most important of the newer schools was organized in Nowawes near Potsdam in 1886, and has an attendance of 200. The distinguishing mark of this school is its department for the education of children who are blind, deaf, dumb, and crippled. Of these especially afflicted children there are 215 in Prussia alone.

**Denmark.**—The model school of Europe for crippled men, women, and children was founded in Copenhagen in 1872, and is still the only one in Denmark. In this school the aim is to fit the pupils to go out into the world and take positions that will render them self-supporting. The institution has five divisions, namely: (1) *Workrooms*. (a) Bandage, mold, and corset making, saddlery, forging, and shoemaking are taught, the articles made being for the use of the cripples. Here are numbers of pupils without hands, wearing appliances which enable them to hold a tool and steady the material worked upon. (b) School of handicraft and manual work, consisting of wood carving, bookbinding, brush-making, joinery, dressmaking, weaving, needlework, housekeeping, cooking, and office work. The age of the pupils varies from fourteen to twenty-six. (2) *Child's School*, where the rudimentary branches are taught. Emphasis is laid upon

A Primary Class: in Adjustable Seats and Desks.

The Kindergarten Class: Listening to a Story.

The School Wagon.

SPECIAL CLASSES FOR CRIPPLED CHILDREN.

the musical training. (3) *Clinic*, where patients are treated and bandages, wooden legs, special corsets, boots, etc., are supplied. These are made by the pupils in the workshops, at the order of the surgeons in attendance, and of some former pupils who have become teachers. (4) *A home*, where pupils from the country live during apprenticeship. The furnishings of this home are made in the different workshops by these children. (5) *Recreation home*, at the seaside, for the most diseased patients, accommodating forty-four in 1909.

**Sweden.**—Industrial schools for adult cripples were established at Gothenburg and Karlskrona in 1885, at Helsingborg in 1887, and in Stockholm in 1879 and 1892. Crippled children are not admitted to the public schools, but special teachers are supplied by the school board to teach them in their homes after school hours. A most careful supervision is exercised over the physical condition of the public school pupils. In the case of defects, such as curvature of the spine, round shoulders, or faulty posture, the teacher sends the children to the royal gymnasium, where curative treatment is given free of charge to the poor. Stockholm has two schools supported solely by private contributions, one the "Society in Aid of the Deformed and Infirm," opened in 1892, an industrial school caring especially for thirty-five adults, enabling them to provide for themselves as far as possible; and the "Eugenia Hemmet's," opened in 1879 with an enrollment of 190, admitting both adults and children. This has the best equipment of any school in Europe. Here the stress is laid upon a good general education rather than a training for the trades. It makes provision in the classroom for a number of the children who are in bed.

**Norway.**—The large school for cripples is the "Sophie Minde" in Christiania. This school stands especially for manual training, and shows that the most helpless cripples are capable of the finest handicraft. Wonderful examples of self-dependence are seen: a man without fingers carves most intricate designs in furniture. By means of her teeth a girl with no arms makes most elaborate and exquisite lace.

**Great Britain.**—The schools for crippled children are a recognized part of the system of public instruction. They are in buildings of their own, and are equipped with furniture and appliances especially adapted to the needs of the crippled child. Each school has an ambulance or two especially constructed at great expense to admit children on stretchers and in invalid chairs, and all are conveyed to and from their homes. A nurse or a paid attendant accompanies each ambulance. When the ambulance arrives at school, the children are given cod liver oil and medicines prescribed by their physicians, and at the morning recess crackers and milk. The largest

number of schools is in London. Here there is provision for the instruction and physical improvement of crippled children which is far in advance of that of any other country. The first effort to provide for special education for crippled children in London was in 1886, when there was formed an Invalid Children's Aid Society, which made many experiments. Then Mrs. Humphry Ward became interested, and induced the London School Board to take up a scheme in 1898, which she had worked out at the Passmore Edwards Settlement in Farvistock Place. She had obtained the use of some ground-floor rooms leading out into a beautiful garden, with a nurse to superintend, and generously presented an ambulance to convey the twenty-five children to and from the settlement. As this effort was very successful, the board, in February, 1899, promptly put through a plan providing the teacher and school furniture. Thus the first "Invalid Center" was established. Since then twenty-three centers have been formed, with over 1880 children on the rolls. Mrs. Ward's school has been the model upon which the other centers have been formed. In making her experiment, Mrs. Ward saw that no school could be successfully carried on without a midday meal for the pupils, and she organized the "Crippled Children's Dinner Society" to provide a hot dinner daily. A good hot dinner of meat, vegetables, bread, and pudding is provided for 2*d.* The London School Board furnishes the kitchen, firing, and cook. The cook is responsible to the head teacher for the proper performance of her duties. The dinners are under the care of the above-mentioned society, one representative manager being elected from each school. The managers meet monthly, accounts and menus are examined, and every case of inability to pay 2*d.* is carefully considered. Free dinners are given only under exceptional circumstances, and it is a noteworthy fact that, although these children come from the lowest and poorest slums of London, in the report of 1907 only 4 per cent of free dinners were given. The "after training" of these children is under the care of the same society that controls the dinners. As the child nears sixteen, which is the age for leaving school, his achievements are carefully noted and brought before the committee, and work suited as far as possible to his particular requirements is found. In the Royal National Orthopedic Hospital, and in the Alexandra Hip Hospital, where special cases are admitted for very long periods, classes are formed under teachers of the London Board Schools. Thus these children do not retrograde mentally, in spite of prolonged hospital treatment, and are fit to take their places again in the "Special Centers," when they are discharged. The "Guild for the Brave Poor Things" at Chailey, is an invalid craft school founded by Mrs. Kimmins, and is also under the inspection of

the Board of Education. Here much attention is given to athletics, the boys playing football, the girls cricket, and both performing on all kinds of apparatus.

Next in importance to London, as regards schools for cripples, is Liverpool. The special schools are carried on under the Elementary Education Act of 1899, which empowers but does not require local authorities to provide for the instruction of physically and mentally defective children. Three of these provide for both the physical and mental defectives. Among other English cities the following have established similar schools: Leeds, one center, with sixty children; Birmingham, two centers, with a hundred children; Bristol, one center, with eighty children; Manchester, a residential school, with thirty children; Oldham, one center, with sixty children; Kingston-on-Thames, one center, with twenty children; West Kirby, Cheshire, a convalescent home school, with thirty-three children.

The especially noticeable feature of the Edinburgh school is the emphasis placed upon the surroundings of the school. The Willowbrae School has beautiful gardens and playgrounds. In the main playroom the south wall opens like a big door of a barn to admit fresh air and sunshine. In the winter this building is utilized for a playroom as a protection from the storms; in the summer, when necessary, as a classroom. In Glasgow there are four well-developed schools, the Freeland, Bridgeton, Finneston, and Hayfield schools, all in special buildings, or old buildings remodeled to fit the needs of these children. The Hayfield school is especially attractive; for though it is a separate new building, it is considered part of the large Hayfield School for normal children, which is a model building throughout. All chairs and reclining sofas are fitted to the children, and thereby add to the children's comfort. The Aid Society assists with the dinners.

**United States.** — *New York.* — In America the work for crippled children was begun in New York in 1861 by Dr. Knight and his daughter in their home on 6th Street. Out of this small combination of school and hospital there grew two years later the new Hospital for the Ruptured and Crippled on 42d Street. This was the first institution in America to employ teachers for crippled children. The Visiting Guild for Crippled Children of the Ethical Culture Society was started in 1892, and it is through their efforts that many children returned from hospitals were sought out and education brought to them. Following closely upon the work of the Guild was the Children's Aid Society. This society was the first to open schools. Special committees were formed to look after the providing of extra nourishment and special orthopedic apparatus. Provision was made for professional oversight and attendants to carry

children up and downstairs. The Aid Society in one year cared for over four hundred disabled children in some four of their schools. In 1898 Rev. Dr. J. Winthrop Hegeman founded "The Guild for Crippled Children of the Poor." The work grew in importance until, in January, 1903, the managers of the guild and its many auxiliaries brought about a coöperative conference. Among the guilds were: (a) the William Davis Free Industrial School, established in 1900; (b) the Crippled Children's East Side Free School, organized by Mrs. Daniel P. Hays in November, 1900; (c) the Day Home and School for Crippled Children, established Feb. 26, 1902; (d) the Crippled Children's West Side Free School, established in 1904. The second and third of these have since joined forces with the Board of Education. The second has a new model building erected by the "Lehman Foundation." The first has disbanded, and the children attend special classes in the public schools. The last is still an independent school. Many other organizations which are run independently are Hospital Schools, a branch at White Plains, the New York Home for Destitute Crippled Children, the Rhinelander School of the Children's Aid Society, the House of the Annunciation, the Association for the aid of Crippled Children, and the Darrach Home, founded by Dr. Darrach, one of the pioneers of this work.

There were many private endeavors to care for disabled children up to 1906. Then one of the first steps toward solving the problem of the education of these children by the public schools of New York City was made. The Board of Education joined forces with two private guilds, (a) and (c). The school equipment and teachers were supplied by the Board of Education; the buildings, transportation, nourishment, and general physical care were looked after by the guilds. This attempt proved successful, and a further advance was made a year later, in 1907, when classes for crippled children were added to the regular public schools whenever rooms were available. At present there are twenty-three classes for crippled children in the public school system of the city of New York. Children from five to sixteen are now in attendance, coming at nine, bringing a noonday lunch, and leaving at two. The expense of three stages for the transportation of these children is borne by the Board of Education, and of others by philanthropic institutions. The regularity of attendance, often 100 per cent, and the general progress made both mentally and physically, justify beyond doubt the existence of these schools. It is estimated that 18,000 crippled children are being treated at the various hospitals in New York City to-day. About 450 crippled children are enrolled in the public schools in Manhattan, and about 300 more in private schools. Through the efforts of the "Driving Fund Association," these crippled children are given

a ride at least once a week to Central Park and the different parks and gardens of the city, thus enabling them, while receiving benefits of fresh air and sunshine, to get glimpses of the outside world of nature and of life, and generally to enlarge their limited experiences. Another feature of the work in New York is "The Association of Public School Teachers of Crippled Children in the City of New York." This group of women is banded together to extend education to the crippled child and to study diseases most common to these afflicted ones, so as to be of service to this most neglected side of our education to-day.

*Chicago.* — The only other city in this country that has taken over the education of crippled children in a public way is Chicago. In January, 1899, the first school was established as part of the Chicago public school system. An act was passed authorizing school districts managed by boards of education to establish and maintain schools or classes for crippled children as part of the public school system, and authorizing payment therefor from the state common school funds. One school in a one-story model building having no stairs is set aside entirely for crippled children. In another part of the city a department in a regular school is set aside for crippled children. The total enrollment for 1910 in these two schools is 195. Hot meals are served to the children, and the stages for transportation are supplied by the Board of Education.

*Boston.* — Through the efforts of Dr. Bradford and Dr. Thorndike, who became acquainted with schools for cripples in Europe, the first school for the cripples and deformed of Boston was started in July, 1894, at the home of Dr. Thorndike, with eleven pupils and one teacher for primary and grammar studies. Later a room was given in a church by the rector, Dr. Kidner, and in Oct. 3, 1904, a new model building was completed which is still the model building of this country if not of the world. Its equipment is complete in every way to meet the needs of the helpless and unfortunate child. This school early in its career aimed to pay pupils for their work in the industrial departments, and the printing room was the first to prove its earning capacity.

*Philadelphia.* — The Widener Memorial Industrial Training School for Crippled Children was founded by Mr. P. A. B. Widener as a memorial to his wife and son. The endowment of this foundation is \$3,000,000. As soon after admission as the physical condition permits, every pupil receives two or more hours of schooling a day; the time increases as the pupils advance in the grades. Every child who has had no previous training is placed in the kindergarden. Pupils who show decided mental ability will receive a higher education in schools and colleges of Philadel-

phia. Likewise opportunities will be afforded to pupils to receive a business education, to study typewriting, bookkeeping, telegraphy, library work, secretary work, etc. A brass band, consisting of twelve horns and two drums, furnishes music for entertainments. There are at present (1910) a hundred children in attendance. As yet there are no public schools for the care of crippled children in Philadelphia although about fifty cripples are at the "Home of the Merciful Saviour," started in 1882, and there is also a school for colored crippled children established in 1887, the "House of St. Michael and All Angels."

*Massachusetts.* — The only state to provide an institution for the care and education of the crippled and deformed children of the commonwealth is Massachusetts. This is in Canton, near Boston, and promises to be the model of its kind. The institution was opened on Dec. 1, 1907. The work of organization progressed as rapidly as circumstances permitted, and on Jan. 14, 1908, when one dormitory was completed, four children were transferred from the State Hospital. During the year, 104 were admitted, 70 boys and 34 girls.

It is a growing conviction that the state has no option but to provide for the crippled child and to give him a chance of leading an independent life. He must not be left to the exclusive care of philanthropy, tender though that be, for he is a future citizen, with all the rights which inhere in that relation.

**The History** of the care and education of crippled children is traced briefly in the following chronological list, giving the date of founding of the more important homes, hospitals, and schools: 1840, Württemberg; 1845, Stuttgart; 1851, London (private crippled girls' school); 1853, Paris; 1862, London (cripples' private nursery); 1864, Zurich; 1865, London (Industrial Home and National Association for Destitute Children); 1863, Stuttgart; 1870, London (Dartmouth Home for Boys); 1871, Turin; 1872, Copenhagen; 1873, Milan; 1874, Dublin (Home for Cripples); 1874, Philadelphia (Hospital); 1878, Genoa; 1879, Baden; 1879, Mantua; 1879, Stockholm (Eugenia Hemmet's); 1882, Philadelphia (Home of Merciful Saviour); 1882, Verona; 1885, Gottenburg; 1885, Stuttgart; 1886, Potsdam, Nowawes; 1887, Helsingborg; 1887, Philadelphia (Home of St. Michael and All Angels [colored]); 1889, Magdeburg; 1890, Helsingfors, Finland; 1892, St. Petersburg; 1892, Hanover; 1892, Chicago (industrial home); 1892, Stockholm; 1892, Christiania; 1894, Boston (industrial school); 1897, St. Paul's (Minnesota State Hospital); 1898, New York City (guild organized for care of cripples); 1898, Altona; 1898, London School Board; 1899, Chicago (public schools); 1900, Arnheim, Holland; 1900, New York State Hospital; 1900, Mecklenburg; 1902, Baden; 1903, West-

falen; 1903, Budapest; 1903, Munich; 1903, Philadelphia (Widener Memorial School); 1904, Westphalia; 1905, Arnstadt; 1906, Munich; 1906, Public Schools, New York City, joined guilds; 1907, Public Schools take over work of city.

**CRITIC.**—Broadly speaking, any person who systematically estimates the worth of educational practice. More particularly, the name applied to the supervisor of practice teaching in normal schools or teachers' training classes, the "critic teacher" who has the supervisory charge of apprentices or student teachers.

See SUPERVISION OF TEACHING.

**CRITICISM.**—In the supervision of teachers a conference in which the supervising official presents a specific judgment of the work of a teacher. Such a criticism may cover a single lesson, a series of lessons, or the entire activity of the teacher.

See SUPERVISION OF TEACHING.

**CRITICISM, ART OF TEXTUAL.**—See TEXTUAL CRITICISM.

**CRITICISM, THE FUNCTION OF EDUCATIONAL.**—The function of criticism in education, as in art, history, and other fields, is to make rational estimates of worth. In education the standard of worth is not beauty, as in art, or truth, as in history, but development. The worth of any given educational condition or practice is to be determined in terms of its ability to provide for moral, social, and individual growth. The methods of administration as well as those of teaching are to be judged by this standard. It is especially necessary in a complex field such as education that criticism be wholesome and rational. Its judgments should be delivered with reference to all the conditions and ends involved. Judgments passed upon an educational situation

from a specialized and narrowed point of view may be useful for the special purposes of scientific thought, but they are not the poised, inclusive, and stable estimates of true criticism. The critical function aims to see the worth of a practical or fine art in terms of every consideration involved. Its point of view is that of the whole, and its resulting judgments are, therefore, wholesome in their effects upon conduct.

The method of examination in criticism is rational. Mere intuitionism or impressionism does not constitute criticism. It may provoke tentative judgments, but these must be reexamined rationally in the light of well-established principles, before the estimate is to be regarded as a critical estimate. Much of the current fault-finding with education is neither wholesome nor rational, and is therefore not to be regarded as the product of a true critical approach. The traditionalist who measures the worth of the present courses of study in terms of their conformity or non-conformity to traditional procedure, and quite without reference to contemporaneous needs, is bound to overestimate the value of such formal subjects as reading, writing, and arithmetic. His standards of criticism are restricted and his approach narrow. A blind devotion to the past, rather than an open-minded, rational examination of social forces and educational machinery, determines his valuation. Similar shortcomings are frequently manifested in the complaints of both laymen and teachers. The manufacturer with a special interest in industrial education and the student of child life are likely to over-emphasize their own points of view to the exclusion of others equally valuable. The result of partial and prejudiced views of the educational situation is a series of uncritical judgments that are the basis of much faddish and futile reform, in which enthusiastic radicalism is followed by reaction. It is the function of a true educational criticism to arrive at judgments of school effectiveness by means of a logical examination of the actual school situations upon which a systematic series of educational principles is brought to bear.

Such a systematic series of educational principles is not to be derived solely from the special sciences that have an application for educational practice. The knowledge afforded by such special fields as biology, physiology, psychology, sociology, and ethics is inadequate to explain all that is involved in education. These specialized, scientific, and accurate studies are still fragmentary in their contribution. They present bodies of principles, derived from a narrow range of phenomena, in isolation, as it were, unmodified in any complete way by those of other fields. Education is not merely an application of several sciences; it is an institutional and personal art, with a point of view of its own, with valid traditions and habits evolved out of the trial, success, and

error of its own intuitions and inventions, its reflections and experiments. These gross extensive experiences of historic and contemporaneous educational practice are as valuable in their way for education as the more refined and intensive investigations of modern science. Together they form the fund of fact from which educational generalizations or principles are derived. It is this body of inductions that constitutes the standards of criticism. A consistent philosophy of education determines, systematizes, and states them; a rational educational criticism applies them to specific practices. While the function of criticism is immediately theoretic in that its direct purpose is to arrive at estimates or valuations of efficiency, its ultimate influence is practical. The practical force of criticism is exerted through educational supervision, which attempts to reconstruct practice through applying the judgments of criticism. All effective supervision therefore rests upon sound criticism.

**CROATIA AND SLAVONIA.**—Provinces under the sovereignty of Hungary with autonomy in home affairs, justice, and public instruction. Area, 16,423 square miles. Population (1900), 2,516,304.

**Historical.**—The history of education in Croatia and Slavonia is in general similar to that of Hungary (*q.v.*), but a few events preceding the eighteenth century have peculiar significance as related to the present time. A college or gymnasium was opened by the Jesuits at Agram, the seat of the present university, in 1607, and after the suppression of the order (1773) was conducted by the Franciscans. A law enacted during the reign of Maria Theresa (1774) provided for a normal school at Agram, which was opened in 1776. Not until 1845 were general regulations providing for the instruction of children throughout the province issued. These regulations were modified by laws enacted in 1874, 1878, and 1888, according to which the schools are now conducted.

**Administration.**—The administration of all schools is vested in the provincial ministry of public instruction. Local supervision is intrusted to school committees composed of the mayor of the respective town or village, a pastor, a teacher, a patron of the school (that is, a landholder, who by virtue of his estate is obliged to contribute to the support of the school), and from two to five other members chosen from among the parents of children in attendance upon the schools.

**Primary Schools.**—The primary schools of Croatia and Slavonia, like those of Hungary, are classified as elementary, and higher. In

some of the cities and larger towns maternal (or infant) schools have been opened. These numbered twenty-three in 1900. The graded elementary schools have from two to five classes; but the majority are ungraded and employ but one teacher. The total number of primary schools in 1900 was 1371. The various languages of instruction, and the number of schools using each, were as follows: Croate, or Serbe, 1303; German, forty-one; Magyar, twenty-two; and two each, Ruthenian and Slovak. Children may attend school at the age of six years, but the compulsory school age is from seven to twelve in the primary elementary schools and from twelve to fifteen, in the higher primary schools. The law specifies that every school shall have a school garden for instruction in elementary agriculture. Textbooks are uniform throughout the provinces.

**Teachers and Teachers' Training.**—There are six normal schools in the two provinces, four for men and two for women. The course of study is arranged for four years, and is both academic and professional in character. Teachers are appointed to positions by the central school authorities upon recommendation of the local committee. They receive an initial salary of 800 crowns (\$168.40), and 100 crowns additional for every five years of service. They are entitled to a pension after six years' service, which amounts to full salary after forty years' service. The teachers of the two provinces are organized into a national teachers' association which publishes a pedagogical review, *Napredak (Progress)*, and a journal for youth, *Smilje*.

**Higher Instruction.**—The secondary schools comprise nine gymnasia, nine realgymnasia, and five realschulen. There is also one lyceum of secondary grade for girls. The Scientific Academy at Agram, which has been in existence since the time of Maria Theresa, was raised in 1874 to the rank of a university with faculties of theology, law, and philosophy. The number of students for the year 1907-1908 was as follows: theology, 117; law, 877; philosophy, 471; pharmacy, 73. The number of professors and teachers was eighty-seven. The total expenditures of the university were 515,230 crowns (\$104,591). The library contains 59,115 volumes. Besides the university there are four seminaries for the training of theological students. These are, however, of lower rank than the university, and do not grant degrees.

**Special Schools.**—In addition to numerous lower industrial and trade schools, there are the following secondary technical schools: four schools of agriculture, four commercial; one school of forestry, and one nautical school. The law provides that every school district (*Bezirk*) must set aside twenty crowns (\$4.06) annually for the support of school libraries. In 1900 the total number of volumes in libraries of this class was 422,000. Scientific study and

investigation are encouraged by the South Slavish academy of science and art, founded in 1866, with a library of 40,000 volumes (1908), and the Croatian society of natural science, with a library of 4000 volumes. In common with Hungary, the provinces of Croatia and Slavonia have borne the shock of conflict between the forces of the Eastern and Western world. But while social disorder and political instability have been their fate, public education has become organized and is rapidly drawing them into the current of Western progress. The material resources of the country are developing through the application of science and technical skill, and, at the same time, the moral transformation of the people is taking place, chiefly through the influence of Christian missions. A. T. S.

**CROCHETING.** — See HOUSEHOLD ARTS.

**CROMWELL AND EDUCATION.** — See COMMONWEALTH AND EDUCATION.

**CROSBY, ALPHEUS** (1810–1874). — Educator; educated at the Phillips-Exeter Academy and the Andover Theological Seminary. He was for several years professor in Dartmouth College; for two years agent of the State Board of Education in Massachusetts, and eight years (1857–1865) principal of the State Normal School at Salem. Author of *First Lessons in Geometry* and a series of Greek and Latin texts, and one of the editors of the *Massachusetts Teacher*. W. S. M.

**CROUP.** — A term used loosely for a variety of diseases of the trachea and larynx, in which there is interference at the glottis with respiration. The so-called "true" or membranous croup is probably in most cases diphtheria. The so-called "false" croup is a disease of the larynx and trachea not resulting in the formation of a membrane, but causing at times spasm of the glottis.

See DIPHTHERIA.

**CRUELTY TO CHILDREN.** — See CHILDHOOD, LEGISLATION FOR THE CONSERVATION AND PROTECTION OF; HUMANE EDUCATION.

**CUBA, EDUCATION IN.** — **Historical Development.** — The modern system of education which is now developing in Cuba is affected by influences that were operating in the island for at least two centuries preceding the final overthrow of the Spanish power. The history of the island down to the Revolution of 1867 is practically the same as that of the other Spanish possessions in America, save that Cuba suffered more deeply and for a longer time the oppressive tyranny of arbitrary power.

Prior to 1790 several attempts were made through private initiative to establish elementary schools for the common people, since

the administrative authorities did nothing in this direction; even in Havana the establishment of elementary schools in the early part of the eighteenth century was due to private philanthropy. At the same time secondary education was of a shallow character; schools which were little more than primary were given the title of academies or institutes and prepared for the university. Latin and singing seemed to be the only subjects to which attention was paid. Efforts to improve education were thwarted by the royal government. In 1603 the municipality of Havana offered to provide classes in grammar, and in 1607 Bishop Juan de las Cabezas Altamirano founded the Tridentine Seminary, the citizens offering to pay a part of the annual expenses. In 1724, after a long struggle dating from 1656, a Jesuit college of San Ignacio was established in Havana, supported by a contribution of \$40,000 from one of the citizens. This institution was united with the older college of San Ambrosio. Since the sons of wealthy families were compelled to seek higher education abroad, efforts were made to secure the establishment of a university at home, and succeeded in 1728. The new university was intrusted to the Dominicans, who controlled it up to 1842, when education in Cuba was secularized.

A new epoch began in 1790 with the administration of Don Luis de las Casas, whose name is held in grateful remembrance by the Cubans. Under his influence the first literary periodical in Cuba was established, and the *Sociedad Económica* (sometimes called *Patriótica*) de Habana, which has been the first mover in all the advances in material interests and education in the island. This society was charged by royal order with the care of education in Cuba. An investigation was at once begun and disclosed a deplorable condition. The society established several free schools for the poor in the face of clerical opposition; in 1816 it secured a government grant for primary instruction. In its movement for higher education the society was able to collect money to found a chair in chemistry, which was filled in 1819 by Professor Don Jose Tasso. In 1811 the chair of philosophy was taken by Felix Varela, who introduced modern philosophy and modern doctrines, thus carrying forward a movement begun in 1797 by Caballero, who first departed from the old Aristotelian philosophy. In 1818 the society established a chair in economics, supported by voluntary contributions. The study of Spanish law replaced the Roman digests. At this period a large number of newspapers and periodicals were published, owing to the liberty granted to the press. The result of the progressive measures was seen in the new literary movement from 1820 to 1842, when committees on history and literature were formed within the *Sociedad Económica*, and

collected a valuable library. Throughout this period the royal government contributed little to progress in education. In 1863 a general reform was effected, by which public instruction was divided into primary, secondary, superior, and professional branches. An interchange of degrees and professors between Spain and Cuba was sanctioned, and in 1878 the professorate in the colonies and the peninsula were made one body. In 1880 a law was passed, as a result of a memorial drawn up by the minister for the colonies on the unsatisfactory condition of public education, regulating superior and secondary instruction and coordinating the branches in Cuba with the same grades in Spain established by royal decrees of 1874 and order of 1875. One article of the law authorized the establishment of a secondary institution in the capital of each Cuban province at the expense of the province or municipality, with a subvention from the Governor-General from the budget of the island. In capitals, where there were no public secondary institutes, colleges of the religious orders might be substituted by the Governor-General, with the advice of the council. But the degrees granted by these private institutions were to be verified, as only the degrees of public institutions were recognized. The want of funds, the indifference of the royal government, and the protracted struggle against Spanish domination prevented any substantial progress in education under the law of 1880.

**Present System.**—On Jan. 1, 1899, the Americans took possession of the island and the American military governor assumed, in regard to education, the functions of the Spanish Governor-General, who had represented the King of Spain. At that time there was a nominal system of public instruction based upon the law of 1865 as modified by the law of 1880, and efforts were at once made to put it into operation. As an inducement to teachers to prepare for the work, it was ordered that salaries for the summer months should be paid to those only who would attend some authorized summer school. Out of this requirement grew the unique plan arranged by President Eliot of Harvard University and Dr. Frye for bringing a body of Cuban teachers to the states to attend the summer school at Harvard free of expense. On June 30, 1900, the military governor of Cuba issued special regulations respecting public education. They provided for the appointment of a Commissioner of Public Schools, and a board of superintendents, consisting of the chief Superintendent and provincial superintendents, one for each province of the island. For the local administration of schools, the island was divided into districts of the first and second classes and municipal districts, and provision was made for the election of a school board in each district. The order required that an

annual school census should be taken, made the instruction of children between the ages of six and fourteen obligatory upon parents and guardians, and provided, further, that teachers' institutes should be held in each province of the island, the attendance of teachers upon the same being compulsory. The superintendents were directed to decide upon a plan for the examination and certification of teachers, to take effect within the year. This order was enforced so far as practicable, and, according to Dr. Frye, the first Superintendent, the number of schools increased from 200 in 1899 to 2000 in 1900, and the number of pupils from 4000 to 100,000.

The formal transfer of the island to the people of Cuba was made by the President of the United States in 1902, and the charge of the system of public instruction passed to the newly organized government. The insurrection of 1906 interfered seriously with the work, but marked advance has since been made. The principal features of the system established by military order have been preserved by the school law of July 18, 1909, and according to official statistics, there were in operation, at the close of the school year 1908–1909, a total of 2175 schools, with 3683 teachers and an enrollment of 132,740 pupils.

The most important recent measures pertaining to the public schools are the efforts at grading and the increase in the number of special branches taught. Kindergarten exercises, sloyd in wood, and physical training were introduced in 1905, and in 1906 lace work, sewing, and pattern work, drawing and modeling, sloyd in cardboard, sloyd in metal, and music. The normal education of the teachers is receiving serious attention, and an elaborate plan for high schools has been matured by the board of superintendents. In the last budget of the Cuban republic a credit of \$42,000 was allowed to provide for an increase from fifty to seventy in the number of teachers of English in the public schools, and it is intended to make a proportionate increase in their number each year, should this experiment prove successful, until the force is adequate for all the public schools. There are to be two supervisors of teachers of English: one for the province of Havana with a salary of \$1500 a year, and the other for the rest of the island at a salary of \$1620 a year. A law of July 10, 1909, authorizes the establishment of a school of agriculture in each of the six provinces of the island, an appropriation of \$270,000 for the building and equipments of the schools, and an additional sum of \$112,680 for the current expenditures as soon as the schools are definitely installed. Public secondary education is provided in the institutes, one in each province, which prepare pupils for the degree of Bachelor. The professors, by virtue of the law of July 11, 1906, have had their salaries increased, special appropriations have

been made for the purchase of scientific material, and examination methods have been rendered less cumbersome and complicated for both professors and scholars. The State contributed the sum of \$268,860 for the maintenance of the six provincial institutes during the past year. The School of Arts (manual) and Trades, which the military government of intervention raised to a high degree of excellence, has been amply provided for. An appropriation of \$41,000 has been made for this institution, which provides both day and night instruction, and turns out skilled workmen and artisans. The estimated appropriation for public instruction for 1908-1909 amounted to \$4,275,794.

*The University of Havana.*—The old constitution of the University of Havana remained until education in Cuba was secularized in 1842, when the theological, Aristotelian, and scholastic system of university instruction, a relic of the Middle Ages, gave way to literary, and, later, to the scientific tastes and requirements of modern times. The degrees in arts, sciences, jurisprudence, medicine, surgery, and pharmacy were retained, while those in theology and canon law were abolished. There are at present three faculties, letters and sciences, medicine and pharmacy, and law, a restriction of degrees which indicates how completely the course of instruction has been modernized. The faculties are subdivided into special schools, in which the particular subjects pertaining to the general branches are taught. Thus the faculty of letters and sciences comprises the "schools" of letters and philosophy, of pedagogy, of science, of electrical engineering and architecture, and of agronomy. In the school of letters and philosophy are taught Latin and Greek, philology, literature, history, psychology, moral philosophy, and sociology. The school of pedagogy comprises pedagogical psychology, the history of pedagogy, methodology, and drawing. The details of the studies given in the yearbook, or *Memoria Anuario*, published by the university, show the manner in which they are carried out.

In 1905, 516 students matriculated in three faculties of the university, of whom 165 were in the faculty of letters and science, 209 in the faculty of medicine and pharmacy, and 142 in the law faculty. In 1907 the university received \$357,358 from the state government.

The State contributed \$16,060 toward the School of Painting and Sculpture, at which over 500 pupils are enrolled. The national library was founded by General Wood. Its personnel has recently been reorganized and increased, and to-day its shelves contain over 40,000 books. The state annually contributes \$11,660 toward its support.

#### CULTURE AND CULTURE VALUES.—

The term "culture" is used in educational literature with a very wide range of connotations. In its most superficial sense (which perhaps is also its most popular) it means possession of a certain kind of knowledge and ability which marks off the person in question as having had superior educational advantages, together with a certain social ease and grace of speech that enables the person to display this knowledge to good special effect. In this sense culture is the mark of a gentleman in the conventional sense of that word; it includes knowledge and ready use of the refinements of social manners, familiarity with literary and historic allusions, and ability to speak, or at least to read, one or more foreign languages. Culture here means practically a kind of intellectual and artistic polish which may indicate genuine refinement or which may be an external veneer. In either case, it implies a contrast of social classes, not necessarily of rich as distinct from the poor, but at least of superior social opportunities.

A more elevated aspect of a certain portion of the conception of culture just noted is found in Matthew Arnold's famous definition of culture "as acquaintance with the best that has been known and said." Culture in this sense describes the humanistic ideal of education. As opposed to naturalism (*q.v.*), humanism (*q.v.*) insists that the truly educative factors are to be found in contact with the past history of mankind, especially as past humanity has left an expression of itself in literature and art. Natural science is of importance in education, from this point of

view, not because it tells us about our present environment, but because certain great discoveries and laws must be known, if we are to be acquainted with the best of what has been said and thought in the past. Politics is profitably studied from this point of view, not so much as having a direct bearing upon the administering of present conditions, but as a testimony and record of the workings of collective human nature.

This conception of culture is historically not so much a direct descendant of the humanism of the Renaissance as a fruit of the German reaction against Rousseau's "return to nature" as a standard of thought and life. While Rousseau's influence in Germany in the latter half of the eighteenth century was tremendous, it took shape not only in the romantic individualism of that day, but also in a deliberate attempt to justify art and science against the attack which Rousseau, in his first prize essay, made upon them. *Bildung*, the conscious and deliberate formation of human personality through assimilation of the spiritual products of the past, was made the standard and goal of education, as over against the appeal to spontaneous, native, but raw and crude instincts and impulses which, in contrast with *Bildung*, defined *Nature*. As Schiller, Goethe, Hegel, and other German writers became influential in England, their main thought as to the nurturing influence of past humanistic products upon present life was embodied in the term "culture." The three chief elements in culture, as summed up by Matthew Arnold, are that it is (1) an inward condition of mind in opposition to dependence upon external and mechanical appliances; (2) a harmonious expansion of all our powers in contrast to oneness of ideas and over-absorption in some special pursuit, and (3) a social conception aiming at the improvement of society as a whole and requiring the subordination of individualistic traditions and aims.

The broadest conception of culture as an educational ideal is reached by developing the last-named factor in the humanistic definition — the social. The questionable point in the humanistic notion, as expressed by Arnold, is not in its end, but in its exclusive reliance upon literature and history as means of reaching this end. The preponderance of the literary factor in the education with which the typical humanist is acquainted blinds him to the fundamental importance of knowledge of nature as a necessary condition of reaching both all-round individual development and an equitable social improvement. From the broader point of view, culture may be defined as the habit of mind which perceives and estimates all matters with reference to their bearing on social values and aims. While it is opposed to the purely utilitarian (or practical in its narrow sense), this opposition is in behalf of a more

universal use — namely, social service. While it is opposed to an abstract, on-sided scientific specialism as an educational ideal, culture requires acquaintance with the natural conditions and forces upon which social well-being necessarily depends. In other words, manual and industrial activities at once acquire a cultural value in education when they are appreciated in the light of their social context, in their bearing upon social order and progress. Natural science acquires a like cultural import when it is pursued not simply as a means of getting information about an external world, but insight into the indispensable rôle of science in general, and natural facts in particular, in the guidance and amelioration of the common social life.

Using this conception of culture as a criterion, we readily place the so-called "culture value" of studies in relation to their information value, their utility value, and their disciplinary value. As these distinctions are usually drawn, they are independent of one another, and apply to different groups of studies, geography, for example, being supposed to have chiefly information value, mathematics chiefly disciplinary value, technical skill (in writing, reading, manual training, etc.) utility value, while literature and history are prominent for culture value.

On the basis of a true, or social, conception of culture, information, use, and discipline are indispensable ingredients of culture, or else they have no legitimate place in any general educational scheme. Culture is the social insight and spirit to which useful skill, knowledge of fact, and trained mental power must all be made to contribute. Where they are isolated from active participation in culture, utility becomes mechanical routine, or else skill in purely egoistic pursuits; information becomes an accumulation and memorizing of a mass of miscellaneous facts that have no bearing upon conduct, and discipline becomes a formal gymnastic of specialized mental habits or "faculties." On the other hand, culture when isolated tends to become a purely external polish and refinement, a mark of an invidious class distinction. We are not dealing here with an abstract theoretical point; no problem is more urgent in contemporary educational practice than promotion of a curriculum and methods of instruction that shall combine the ideals, separated since the time of Aristotle (see ACTIVITY) of a liberalizing nurture of the individual and fitness for a vocation of social service. J. D.

**CULTURE EPOCH THEORY.** — The fundamental ideas of this theory are (1) that there is a general parallelism between the development of the human race and of the individual; that (2) this parallelism is of fundamental importance for the selection and arrangement of the materials of the course of study (*q.v.*); that (3) the appropriate basis of the content of study at each period of child growth is the culture products (literature especially) of the corresponding period of race development. The general idea has never been better stated than by Goethe in the following words: "The youth must always begin anew at the beginning, and as an individual traverse the epochs of the world's culture."

The theory has been independently reached from a number of different points of view. Three of these modes of approach may be especially signalized. (1) The philosophic-historic. The reaction against the rationalism and the individualism of the French and German enlightenment of the eighteenth century led many German thinkers to a vivid appreciation of the part played by the social institutions and traditions of the past in bringing individuals to their present status, and of the necessary rôle of past culture in the further development of a well-founded personality. Against the "Return to Nature" of Rousseau the necessity of nurture by culture (*q.v.*) was insisted upon. Formal rationalism in its zeal for reform and progress would make a *tabula rasa* of the past, and regarding government and religion as mainly conscious inventions to keep the masses in subjection to the interests of a few, would start afresh on the basis of an equality and liberty of individuals demonstrated by pure reason. Against this Herder, Lessing, Goethe, and Hegel emphasized the continuity of institutional life, and the fact that history contained implicitly a deeper rationality than that of the isolated self-consciousness of individuals. Moreover these writers upheld the application of the idea of evolution in one form

or another to the history of humanity, and thus elaborated the notion of a developing series of stages through which mankind has progressively passed in traversing its course to the full unfolding of its corporate destiny. From these conceptions they drew, with varying degrees of explicitness, the conclusion that individuals go through the same general course of development and attain their fullest and most harmonious development in the degree in which they repeat the progressive stages of the race. (2) Other writers (again mostly German) approached the matter from the educational side. The aim of education is to elevate the child to the perfect cultural plane of present civilization. Because of the contrast between the immaturity and narrowness of the child's experience and the complexity and richness of present civilization, this problem of elevation must be attacked indirectly and gradually. The child cannot directly assimilate or appreciate the highest and best in the life about him. He can rise progressively to it by living through the significant and valuable factors of the past stages out of which the present has evolved; the earlier being the simpler are better adapted to the child psychology — to his apperceptive masses and his interests. Herbart and his followers presented this point of view. (3) The discovery (in embryology) that the individual growth (the ontogenetic series) recapitulates the evolution of animal life (the phylogenetic series) has been employed to give the doctrine a scientific biological foundation, or at least a support by analogy.

Before considering the doctrine critically we may note some of the attempts which have been made to apply the theory to educational practice. Some pedagogical writers have laid stress upon the complete and almost unconscious absorption of the individual in the group as the characteristic mark of the earlier stage of development of the race and the child; have selected individualistic reaction and protest as the sign of the second period, and voluntary and conscious loyal reattachment of the individual to the interests and well-being of the social group as the key to the final stage. Others have fixed upon three stages of intellectual development as the common element: first, the predominance of emotional imagination, — the mythical, animistic phase of mind; second, the development of a matter-of-fact interest, expressed in tendency to observe, to collect, to make utilitarian constructions; third, the emerging of conscious reflection, characterized by interest in abstraction and generalization. Still others have fixed upon typical industrial periods in the evolution of humanity, carrying with them a great knowledge of natural energy and law and increased ability to utilize them: *e.g.* (a) hunting and fishing, (b) nomadic and shepherd life, (c) agriculture, (d) use of metals and beginnings of manufacture, (e) universal

commerce and intercourse. They have then sought for corresponding psychological traits in the development of the child during the years of school age.

The curricula based upon these various methods of interpretation have agreed more closely than the diversity of the point would perhaps have led us to anticipate. Myths and fairy tales afford the appropriate nurture for the earliest period. Robinson Crusoe and stories of the Biblical patriarchs make a transition to the study of tribal and national heroes and founders of states; modern history and literature (especially the development of the particular state to which the child belongs) of the later years. The German schemes are also complicated by the necessity of exerting the scheme on the side of instruction in religion and in the Old and New Testaments.

Regarding the theory in general, it must first be heartily acknowledged that it makes practically the first attempt to treat the curriculum, especially in its sequence, upon other than conventional, or formal and logical grounds. Educational theory is indebted to the doctrine for the first systematic attempts to base a course of study upon the actual unfolding of the psychology of child nature, and at the same time to connect this psychological growth with indispensable sociological considerations. This fact being cordially recognized, certain important qualifications need to be introduced regarding the use of the doctrine to determine the appropriate materials and best sequence of the studies in the curriculum. (1) The primacy of the *contemporary* social life and relations of the child must be mentioned. Even if the parallelism of child growth and social development could be made out in a general way, it would still remain true that *educationally* the existence of certain types of culture in the past is no reason for emphasizing the materials of those periods in present education. The child at best has only a short time to pass through what the race has taken long ages to traverse; and it may well be that certain psychological tendencies in the child (supposing that they do correspond roughly to the dominant traits of some past historic period) need to be slurred over, or at least short-circuited, rather than emphasized or brought to consciousness. Hence (a) no past period should be selected except as it serves to increase the child's insight and appreciation of significant and valuable features of present civilization. The criterion of selection and emphasis is in contemporary, not in past civilization. (b) Moreover, the starting point, the ground of departure, must always be sought in activities and materials with which the pupil is already directly familiar in his present social environment. The motive and the "apperceptive masses" of dealing with the past must be found in problems and materials with which children are confronted in their ordi-

nary social life. Finally (c) when excursions are made from the present to the past, pains should be taken to see that the knowledge of the past does not remain isolated, but is promptly reapplied to insure a better appreciation of the present social environment. In short, the child is not, educationally speaking, to be led *through* the epochs of the past, but is to be led *by* them to resolve present complex culture into simpler factors, and to understand the *forces* which have produced the present. (2) The present psychological structure and tendencies of children must be used as criteria for estimating the educational bearing of the past periods, not *vice versa*. That is to say, we must not assume that because certain activities and interests are presented in the history of the race, they are therefore now presented and significant in child experience. We must make an independent examination of the structure and growth, physical and mental, of children, and having ascertained the operation of certain needs and capacities look to the history of the race to find out appropriate material for supplying the needs and nurturing the capacities. (3) The doctrine, as usually expounded, underestimates the value of the *processes* which have marked the development of the race, and exaggerates the importance of *products*. Ziller, for example, stated that the culture history of the race is deposited chiefly in the literary masterpieces in which the various epochs have manifested themselves; and in general the more ardent devotees of the culture epoch doctrine have tended to make literature and history the centers of the course of study. Two fundamental exceptions must be taken to this conception. In the first place, literary products cannot be adequately understood except with reference to the activities which have manifested themselves in artistic expressions. To isolate the literature of Greece and Rome from the social, the economic, political, and scientific, activities which lie behind that art is to deprive the latter of much of its vitality and significance. In the second place, emphasis upon past products at the expense of processes is defective in promoting an understanding of the present. The method tends toward a static conception of society; it fails to present the forces which have made society progressive and which render it still a moving, changing, dynamic process. If the activities shown in industrial struggles, of invention and scientific discovery, in the conquest of nature and in changes of social organization require primary emphasis, the literary products, while precious documents of education, should be treated as consummations of these active processes, not as the primary and essential educative material. J. D.

**CUMBERLAND UNIVERSITY, LEBANON, TENN.**—A coeducational institution established in 1842, as a college of liberal arts and a preparatory school. There are now maintained the college of arts and sciences, engineering school, law school, school of pharmacy, and the conservatory of music. Students are admitted either by certificate from approved schools or by examination of the Association of Colleges and Preparatory Schools of the Southern States. The degrees of A.B., B.S., A.M., LL.B., C.E., B.M., and Ph.C., are conferred on fulfillment of the requirements. There is a faculty of nineteen members.

**CURIOSITY.**—Sometimes described as an instinct. Among animals, as, for example, in some of the monkeys, curiosity appears as a natural disposition to examine every accessible object. There is doubtless some justification for the description of curiosity as a natural instinct, as every animal is disposed to secure as complete stimulation for all of his senses as circumstances will permit. Thus, there is an inborn reflex tendency to look in the direction of any sound which is heard so as to add visual experience to auditory, as there is a natural reflex tendency to reach after objects that attract the visual attention so that there may be added to the visual impression a series of tactual sensations from the object. The higher an animal's senses and the more varied its activities, the larger the number of objects that will thus attract attention and arouse what may be legitimately regarded as natural sensory curiosity. After the analogy of these natural tendencies, it is possible to cultivate in children artificial interest in objects to which their attention is directed. Acquired curiosity follows in the train of acquired experience, for as soon as experience in any given line has accumulated, there is a disposition on the part of the individual to increase his information about the objects with which he has been in contact. The whole matter of curiosity belongs, accordingly, in the same general category as the same general problem of attention and interest.

**CURRENT EVENTS. STUDY OF IN SCHOOLS.**—This subject may be defined

as a study which has for its object the teaching of present events of political, commercial, industrial, social, religious, and artistic importance. As a separate subject it is to be found in the curricula of very few colleges and schools. Its earliest advocates had in mind its close relation to courses in civics or citizenship, and advised its inclusion in the school curricula for that reason. Papers read before the National Educational Association in 1889 and 1892, urged the teaching of current events in the schools. The arguments were based on the following grounds. The study of civics with reference to the affairs of the day develops Americanism of the best type. In order to learn to appreciate America's institutions, nothing is of greater value than the comparisons made possible by the study of current happenings in other countries. Its study trains the pupil to read the newspaper and thus to keep abreast of the times, and connects school life with home and the world. The teachers themselves are benefited by such a course because it forces them to keep in touch with matters of contemporary importance and gets them away from their oracular methods. It gives both pupils and teachers an acquaintance with a vocabulary common in the political and economic phases of the world's activities and enables them to become discriminating readers of the daily newspapers.

Notwithstanding these or similar pleas, the teaching of current events has remained a neglected one in the school and college curricula. What has been done has depended almost entirely upon the personal predilection of some superintendent, principal, or teacher. However, in answer to a demand from some New England schools the publication of a small sheet entitled *Current Events* was begun in Springfield, Mass., in the late nineties. This comprised extracts taken from various newspapers which were used by pupils in schools or by school Current Events Clubs to paste in scrapbooks. An improvement on this was found in the *Little Chronicle*, published in Chicago, which is a newspaper for young people. In this the news items were written for the young. Terms or items which might prove difficult were fully explained. In 1909 the People's Institute (*q.v.*) in New York—a civic organization—began the publication of a *Civic Journal* containing accounts of current events relating mainly to the City of New York. This journal was designed for use in high schools, colleges, and civic clubs. In addition to these publications designed primarily for the teaching of events of present moment, the current magazines are usually made use of.

Within the last few years there has been a widespread demand for the study of more modern and recent history in both schools and colleges. It seems strongly probable that the study of current events will form a part of such

## CURRICULUM

courses. Economics cannot be intelligently studied without constant reference to current events, and the Committee on Civics of the New England History Teachers' Association and the Committee of Five of the American Political Science Association have both come out emphatically in favor of the study of newspapers and current magazines in connection with the work in civics. **CURRY, JABEZ LAMAR MUNROE** (1825-1903).—Educator, born in Lincoln County, Ga. on the 5th of June, 1825. He was graduated from the University of Georgia in 1843 and Harvard in 1845. For many years he was professor in Richmond College and president of Howard College, Ala. From 1881 to the time of his death he was connected with the Peabody educational fund and was actively engaged in educational reform in the South. Author of *History of the Peabody Educational Fund* (1898) and of numerous essays on educational conditions in the South since the Civil War. He died at Asheville, N.C., on Feb. 12, 1903. W. S. M.

**CURTAINS.**—See SHADES.

**CURVE, GRAPHIC.**—See GRAPHIC CURVE.

**CUTANEOUS SENSATIONS.**—The sensations received from the skin are now put at four, the mechanical senses of pressure and pain, the thermal sensations of warmth and cold. Each is apparently a distinct sense quality with a distinct nerve terminal, as is established by the different distribution of the sense qualities, both for the separate spots and the wider groupings of the qualities. These qualities are treated under the separate heads. The vaguer cutaneous qualities, such as tickling and itching, wet and dry, etc., are either complexes of these qualities or complexes of some of these qualities with vascular or muscular sensations; they do not have distinct sense organs, and are not new qualities. W. B. P.

**CURTIUS, GEORG** (1820-1885).—A distinguished German philologist and author of textbooks. Born in Lübeck, he studied at the universities of Bonn and Berlin (1838-1842), was appointed professor of classical philology in the University of Prague (1847), whence he went to Kiel (1854) and later (1862) to Leip-

## CUSTOM

zig. He was the first to use the results of comparative philology for the study of the classical languages in the higher schools of Germany. His *Griechische Schulgrammatik* (*Greek School-grammar*), first published in 1852, was translated into many languages, and is still used in many schools. Other works of his are: *Grundzüge der griechischen Etymologie* (*Elements of Greek Etymology*, 1858-1862) and *Das Verbum in der griechischen Sprache* (*The Verb in the Greek Language*), 2 vols., 1873-1876. F. M.

**CURVATURE OF THE SPINE.**—See KYPHOSIS; SCOLIOSIS; SPINAL CURVATURE.

**CUSTOM.**—Custom is for social life what habit is for individual life, namely a principle of organization, continuity, and efficiency. The problem of the relation of custom to habit is similar to the general problem of the relation of society and the individual. The individualistic philosophy starts with habit as built up in an individual, and treats customs as due to the spreading of this habit by example, inculcation, etc., to other individuals. If a sufficiently large number of individuals acquire the habit we have a custom. This view accounts without doubt for some of the facts, but is very one-sided. Most of the important habits of the individual are dependent for their origin and growth upon prior customs in society, *i.e.* language, polite manners, and social conventions, and a large part of the content of morality. Hence the fundamental position of custom in educational practice. Not only does the individual teacher tend to form his own habits of teaching on the basis of the models to which he has himself become accustomed, but the materials and ideals of instruction are derived in the main from the customs of the social group of which he is a member. In savage and barbarian societies and in some types of civilized societies (*e.g.* China and Ancient Egypt) the entire educational procedure falls within the scope of this category. The whole aim of education is to reproduce as a habit of the individual the customs of the group to which he belongs; all deviations are looked upon as immoral or even sacrilegious. As a result (to quote Grote) "Nomos (Law and Custom) King of all" (to borrow the phrase which Herodotus cites from Pindar) exercises plenary power, spiritual and temporal, over individual minds; moulding the emotions as well as the intellect, according to the local type . . . and reigning under the appearance of habitual, self-suggested tendencies."

Even when, as in progressive modern states, custom loses its complete supremacy, it remains one of the chief standards, or norms, of educational practice. As socially handed on from generation to generation, it becomes tradition; and our tendency to ignore the in-

fluence of tradition as a controlling factor is itself very largely due to the fact that when we begin to reflect, to invent, and to project new methods and aims, tradition has already done its work so completely that we take it for granted without thinking about it, so that we deliberate and project within limits set by custom. At the same time, individual variations from custom must be encouraged in a society which has progress as one of its ideals. One of the most delicate problems of school organization and of individual teaching is the adjustment to each other of the two factors of social habit and individualistic departures. Variations are encouraged by the contact of groups of different traditions and customs; where, as in the United States, pupils represent different races, nationalities, religious and social conventions, the attrition of custom is very great. While the situation is favorable to growth of independence and initiative, and doubtless counts as a large factor in the versatility, ingenuity, and adaptability of the American habit of mind, there is also danger of loss of all regulative standards and of the development of lawlessness and caprice. The public school, more than any one agency, has to solve the crucial problem of promoting genuine individuality and at the same time conserving the factors of continuity and coherence of action and belief that are supplied by custom.

J. D.

**CUTLER, CARROLL** (1829-1894). — Educator; attended Phillips Academy, Andover, and Yale. He was professor of philosophy and ethics in Western Reserve College (1860-1871), and president of that institution from 1871 to 1886. Author of *History of Western Reserve College* (1876) and *Lectures on Ethics* (1877).

W. S. M.

**CUTLER, TIMOTHY** (1683-1765). — Educator; graduated from Harvard College in 1701, and was elected the third president of Yale College in 1719, but in 1722 "he was induced in consequence of reading the works of a number of late writers in England, to renounce the communion of the Congregational churches, and the trustees therefore passed a vote excusing him from all further services as rector of Yale College, and requiring of future rectors satisfactory evidence of the soundness of their faith in opposition to Arminian and prelatical corruptions."

W. S. M.

**CYRIL OF JERUSALEM** (c. 315-386). — Church Father and Bishop of Jerusalem. His *Catecheses* (345) are of great value for the insight which they give into the educational methods of the time, and for the light which they shed on dogmatics, liturgies, the Canon of Holy Scripture and the manners and customs of the early Christian doctrine and practice, treating exhaustively of the creed and sacraments and

including all that a Christian was then expected to know and believe. They are the best indication of the quiet, solid, systematic work done by the early Church in her catechetical (*q.v.*) and catechumenal schools (*q.v.*). W. R.

**CZERNOWITZ, THE IMPERIAL-ROYAL FRANCIS JOSEPH UNIVERSITY OF.** — This institution in the province of Bukowina, Austria, was opened on Oct. 4, 1875, the day that marked the one hundredth anniversary of the union of Bukowina with Austria. It includes faculties of Greek-Oriental theology, law and political science, and philosophy, the latter being expanded in 1876 by the establishment of a division of mathematics and natural science. The library contains about 110,000 volumes. The Bukowina Provincial Museum, located in Czernowitz, was organized in 1891. During the winter semester of 1909-1910, 940 students were in attendance on the university. The language of instruction is German.

**DABOLL, NATHAN** (1750-1818). — The author of the first American textbook in arithmetic; born in 1750. He was an instructor in navigation, and is said to have had 1500 different students under his charge. His *Schoolmaster's Assistant* (1799) was for many years the only textbook in arithmetic used in American schools. He died at Groton, N.Y., Mar. 9, 1818.

**DAILY PLAN.** — See PLAN, LESSON.

**DAILY PROGRAM.** — See PROGRAM, SCHOOL.

**DAKOTA WESLEYAN UNIVERSITY, MITCHELL, S.D.** — A coeducational institution established in 1885 under the auspices of the Dakota Annual Conference of the Methodist Episcopal Church. An academy, college of liberal arts, and schools of education, commerce, music and elocution, and a summer school, are maintained. Students are admitted on certificates or by an examination, the requirements for which are equivalent to a high school course. Degrees of bachelor are given in arts, philosophy, science, literature, on completion of the courses and at least one year of residence; the master's degree is also conferred on one year of resident or two of nonresident work. The faculty includes twenty-seven professors and instructors.

**DALE, DAVID** (1739-1806). — Manufacturer and philanthropist. He was the founder of the village of New Lanark in Scotland, where he planted the first cotton mill. Robert Owen (*q.v.*) became Dale's son-in-law. Although Dale was opposed to the movement for which Owen stood, he took a deep interest in education. He was the founder of one of the earliest night schools in Great Britain for the children who were obtained from public charities and employed in his mills. But however well-intentioned Dale's system was, it could not succeed with children of a very tender age, who worked in the mill from six in the morning to seven in the evening. Owen, who gives an account of Dale's work in *A New View of Society*, says, "This labour through the day, and their education at night, became so irksome, that numbers of them continually ran away."

**DALE'S METHOD.** — A systematic method for teaching reading, devised by Miss Nellie Dale and presented in a volume *On the Teaching of English Reading.* It is one of several phonetic systems current in England. Stress is laid upon giving an adequate foundation in oral language prior to the beginning of reading itself. Conversational lessons are used to develop the speech of children, and the children are encouraged to discriminate among the more obvious differences of sound found in the consonants and vowels. The material for the first actual reading is carefully composed in order that consistency between spelling and pronouncing be maintained. Anomalies of spelling and sounding are presented later, after the child has acquired some power and confidence in reading. The only phonetic signs used are colored letters, and the use of these is restricted to the primers or first books. In this system, vowels are indicated by red letters, "voiced consonants" by black, "voiceless consonants" by blue, and silent letters in light yellow. H. S.

See **READING, TEACHING OF.**

**D'ALEMBERT, JEAN LE ROND.** — Born in Paris in 1717, and died there in 1783. He was the illegitimate son of the Chevalier Destouches, and was brought up under the care of a glazier's wife, named Rousseau, for whom he cherished the greatest affection throughout his life, and with whom he lived in circumstances of frugality and simplicity the greater part of his life. His name was assumed. His education was received first at a boarding school, where he soon mastered all the studies. In 1730 he entered Mazarin College, kept by the Jansenists (*q.v.*), where he early distinguished himself as a mathematician, though theology was supposed to be his ultimate study. After leaving the college, he pursued his studies in the higher mathematics privately, with great success

and satisfaction to himself. He also studied law and medicine, upon the advice of friends; but though he was admitted to the bar in 1738, he abandoned all idea of a professional career and settled down to the life of a private citizen and student, a decision which was facilitated by the annuity which his father left him, and which was increased in later years by the esteem and affection of Frederick, King of Prussia, and David Hume. He did not seek honors, and lived an obscure life for many years; but after his fame spread he might have occupied the chief seats in the academies of Europe. He preferred the simple régime of the house of the glazier's wife. It may hence be inferred that his tastes were far from fashionable. As a matter of fact, he was simplicity itself, a great lover of independence, and withal most abstemious in habit.

His principal works were in the domain of mathematics, toward the advance of which he made lasting contributions. His *Traité de Dynamique* (1713) greatly simplified the solution of complex dynamical problems, while his brilliant *Réflexions sur le Cause général de Vents* (1746) won for him the friendly patronage of Frederick, King of Prussia, and the offer of the presidency of the Berlin Academy. In philosophy his chief work was the contributions made, in association with Diderot, to the *Dictionnaire Encyclopédique*, and the *Eléments de Philosophie* (1759), in which he discusses the principles and methods of the principal sciences. D'Alembert's religious views, expressed in the former work, brought down upon him the wrath of the Jesuits, against whom also his essay entitled *Sur la Destruction des Jésuits* (1765) was directed. For educational philosophy, in the technical sense, his importance is less significant. His psychology may be evaluated by stating that he distinguished the human faculties into memory, reason, and imagination. Following out this classification, which he considered true, he arranged all sciences under three heads corresponding to this threefold division of mental phenomena, namely: history, which is the science of memory; philosophy, which is the science of reason; poetry, which is the science of imagination. The arrangement is not without its suggestive utility, but it is based on a false assumption. No science is the product of any one faculty to the exclusion of all others. In pedagogy his influence has been practically nil. Yet he was obviously a true educator, and did much, by his independent and kindly character and by the simplicity of his life, to set a true example to the pampered literati and hangers-on in the philosophical circles of his day. His essays on literature and research were, moreover, a direct contribution to the cause of the freedom of study. (Por. opp. p. 307.)

BERTRAND. *D'Alembert.* (Paris, 1889.)

**DALHOUSIE UNIVERSITY, HALIFAX, N.S.** — Founded in 1818 as Dalhousie College, and opened in 1838. University powers were obtained in 1841. The faculty of medicine was organized in 1868, and merged into the Halifax Medical College in 1875; the faculty of science was first organized in 1874; a school of mines was opened in 1902; in 1906 the faculty of engineering was established. Students are admitted on passing the matriculation examination. Degrees are conferred in arts and science, music, law, medicine, surgery, and dental surgery. There are fourteen professors and forty-one lecturers.

**DALLAS COLLEGE AND LACREOLE ACADEMY, DALLAS, ORE.** — A coeducational institution, founded in 1900 under the auspices of the Oregon Conference of the United Evangelical Church. A three-year academic department, collegiate, commercial, and musical courses are offered. Admission requirements represent about eight points of high school work. Degrees are conferred in classical, scientific, elementary, and musical courses. There is a faculty of eleven members.

**DAME SCHOOLS.** — England. — Whether schools for young children kept by women existed in England before the Reformation is a question that research has not yet answered. It is, however, known that women acted as teachers, and not only in nunnery schools, before the Reformation. In Dan Michel's *Aycubite of Inwyt*, written in the Kentish Dialect in 1340, Avarice is called "The maystresse that heth zuo greate scole thet alle goth thrin vor to lyerni" (Early English Text Society's ed., G. D. R. Morris, p. 34), and this phrase shows that a school conducted by a mistress was not an unfamiliar notion. Mr. A. F. Leach (*Victoria County History, Lincolnshire, Vol. II, p. 451*) quotes an entry in the records of the Corpus Christi Guild at Boston in Lincolnshire for the year 1404 which contains the phrase "Matilda Marefleet, school mistress (*Magistra Scholarum*) in Boston." Mr. Leach considers that the school in question could not have been the Boston grammar school, as the Chancellor of Lincoln, in whose hands the appointment to the grammar school lay, would not have licensed a woman. The school probably was not the Boston grammar school, and was almost certainly what we should call a dame school, but it is clear that the chancellor of the diocese could grant a woman a license to teach grammar. The Petition of 1406 (7 and 8 Hen. IV, *Rot. Parl.*, II, 584. See A. Abram's *Social England in the Fifteenth Century*, p. 182) asked that no man or woman should "exercise aseuns escoles d'aseun secte ou doctrine" contrary to the Established Church. This rather suggests that women might teach in orthodox schools. But it is unwise to dogmatize on the question of medieval Dame Schools. We may go so far as to

say that they probably existed, though the fact that girls went to school (see 2 Hen. IV, c. 15, 1401) is no proof that there were school mistresses, for it is known that secular priests taught little girls as well as little boys, as in the case of Sir William Barbour's private elementary school in London (*Early Chaucery Proceedings*, 1485). The early evidence for dame schools after the Reformation is even more scarce than for the earlier period, but this is clearly because the subject has not been pursued. In fact, local small schools governed by mistresses were plentiful enough in Elizabethan times. Muleaster (*q.v.*) seems to make this clear. But the dame school did not become common until the absence of better elementary schools in the early eighteenth century created an opening for these small private adventure schools. Shenstone (1714-1763) described such a village school in the most decadent period of English education in his poem *The School Mistress*. In this poem Shenstone commemorates his first teacher, an ancient dame, Sarah Lloyd:

"In every village mark'd with little spire,  
Embowered in trees, and hardly known to fame,  
There dwells in lowly shed, and mean attire,  
A matron old, whom we schoolmistress name,  
Who boasts unruly brats with birch to tame."

"Learning's little tenement" had a board at the door to prevent the infants from straying. The dame tempers the birch with gingerbread and "sugared cakes," thus rewarding goodness as well as naughtiness. Her method of teaching is shown by the following stanza: —

"Lo, now with state she utters her command!  
Eftsoons the urchins to these tasks repair,  
Their books of stature small they take in hand  
Which with pellucid horn scoured are,  
To save from fingers wet the letters fair."

The education given from this time on for more than a century in these schools was instructionally almost valueless. In Mr. Brougham's speech in the House of Commons on Mar. 28, 1820, on the "Education of the Poor" (see Hansard, Vol. II, cols. 49, 89) he refers to the dame schools, "where 53,000 were educated, or rather not educated, for it amounted to no education at all, since the children were generally sent too young, and taken away just when they were competent to learn. He admitted, notwithstanding that these dame schools were most useful, on account of the regularity and discipline they inculcated. . . . He anticipated that dame schools would get into better hands, and be better conducted. One school of that most interesting class was but a short walk from the spot on which he then stood; and he had already called the attention of the House to it. . . . But if dame schools were better regulated, and adapted to the example of the school in Westminster, and the example of Fellenberg (*q.v.*) and Lanark (see articles on BUCHANAN and ROBERT OWEN), he would not say that there would not be a pauper or crimi-

nal in England, but he could say that Scotland or Switzerland would not have fewer than England, even in seaport towns." This tribute to the moral and religious influence of dame schools in 1820 is worthy of notice. It must also be noted that some of the elementary free schools were for the time being dame schools. Thus from 1783 to 1786 the Free School at Welbourn was taught by a woman, Mrs. Robson. How low were the salaries paid to women at this time for teaching work is shown by this instance. She was paid *per annum* during the period 1783-1786 twelve guineas, a guinea a month (see Rogers's *History of Agriculture and Prices*, Vol. VII, Pt. i, pp. 523 (i), 525 (ii)). The same work gives other information as to the payment of women teachers: Miss Poe on January, 1776, at Castle Howard was paid for one quarter's schooling, ten shillings and sixpence (*ibid.* p. 517 (iii)). There are other cases (in 1755) when teaching was paid at rates varying from one to two shillings a week.

Throughout England the institution existed in practically the same form until very recent times, although its place has now been taken to a large extent by the public infant schools. The

A London Dame School (1870).

description of these schools in the *Report of the Educational Commission*, 1861, gives a detailed picture, many features of which have characterized the dame school throughout its entire existence: "Dames' schools are very common both in the country and in towns. They are frequently little more than nurseries, in which the nurse collects the children of many families into her own house instead of attending upon the children of some one family. The general character of these schools is the same in every part of the country. Women are always the teachers. They are generally advanced in life. . . . The dames' schools are apt to be close, crowded, and dirty. 'The usual scene of these schools,' says Mr. Winder, in reference to Rochdale, 'is a cottage kitchen, in which the mistress divides her time between her pupils and her domestic duties. The children sit round the room, often so thickly stowed as to occupy every available corner, and spend the greater part of their time in knitting and sewing. At intervals the mistress calls them up, one or two

at a time, and teaches the alphabet and easy words, the highest proficiency attained being the power of reading a little in the New Testament.' In Plymouth and Devonport the account given of such schools is even less satisfactory. One of Mr. Cumin's informants says: 'The dames most commonly have only one room for every purpose, and their scholars may often be seen sitting round the sides of a four-post bed on low forms, the sides of the bed forming a back to the seat; sometimes on the sides of the bed. When the children are present, the atmosphere is always oppressive to me, and often, if I stay in it for ten minutes without opening the window, it makes me sick.' 'The room,' adds Mr. Cumin, from his own observation, 'is often so small that the children cannot stand in a semicircle round the teacher. Indeed, I have seen the children as closely packed as birds in a nest, and tumbling over each other like puppies in a kennel.'" J. E. G. de M.

**America.**—The dame school was transplanted to America at the time of the colonization. But although the dame schools undoubtedly existed in Massachusetts from the earliest settlements, the first definite mention of them is found in Woburn, Mass., in 1673. One was kept by "Allen Conyar's wife," another by "Joseph Wright's wife." In Concord in 1680 there were "in every quarter of our town men and women that teach to read and write English when parents can spare their children and others to go to them." In Cambridge "for English our school dame is goodwife Healy." Samuel Sewall records in his Diary in April, 1691: "This afternoon had Joseph to school to Capt. Townsend's mother, his cousin Jane accompanying him; carried his horn book." Mrs. Trivett and Mrs. Wooddell were dames in Boston during the second decade of the eighteenth century. The wife of Ebenezer Field, the smith of the town of Northfield, kept the first school in that town during 1721. "She taught a class of young children at her own house, for twenty weeks of the warm season." Instruction was confined largely to the learning of the A B C's and the beginnings of reading. The horn-book (*q.v.*), so called by reason of its construction, was widely used for this purpose. Those dames who received older pupils taught them from a speller or primer. The reading matter was wholly religious or moral. Instruction in knitting was also sometimes given. It is said that the dames were usually engaged in knitting or sewing during the time they were teaching, and that a rap of the thimble upon the head of a disorderly child was one of the most favored methods of discipline. Household duties of various sorts were also given attention during hours of instruction. The Dame School was the primary school of early New England, the knowledge attained in it being a prerequisite to entrance to the town reading and writing, or grammar school. There were usually several dame schools in each town, situated at central

points of population. The distribution of dame schools played a very large part in the creation of the idea of the moving school (*q.v.*). During the eighteenth century some towns supported public dame schools. The private dame schools continued, however, until the existence of public primary schools became general during the first half of the nineteenth century. The private primary school of the present day is a development and perfection of the dame school.

**DANA COLLEGE AND TRINITY SEMINARY, BLAIR, NEB.**—A coeducational institution owned and supported by the United Danish Evangelical Lutheran Church in America. Danish is used largely in the theological branches as the medium of instruction. Academic, collegiate, normal, commercial, musical, and theological departments are maintained. Only two years of college work are given, and based on about eight points of high school work. There are ten professors and one instructor on the faculty.

**DANA, JAMES DWIGHT (1813-1895).**—One of the founders of the National Academy of Science and the American Association for the Advancement of Science (*q.v.*) was graduated from Yale College in 1833. He was two years mathematical instructor of midshipmen in the United States navy, and many years professor of physical science in Yale College. Author of textbooks in geology and mineralogy and of many other scientific works. W. S. M.

**DANCING.**—The dance is a form of movement in which the motion itself is the object of interest. It is thus differentiated from all forms of movements which are employed for the accomplishment of some practical aim, as well as from those motions that are employed in play where something has to be done in order to win. It is also different from those motions like yawning, stretching, walking, hopping, and flapping of wings, which are done for the sake of the relief through change which they bring about. The dance compensates for this lack of motive for its movements by two important

means: First, through rhythm, a definite form is produced by means of repetition; second, through imitation and association, as well as by dress, speech, and song, a content and meaning are given to the form. While some animals, such as the bower bird, go through movements at the time of mating said to resemble dancing, the rhythmic element is so slightly sustained that it is safe to say that the dance is pre-eminently a form of movement associated with human intelligence. In fact, as the development of the hand as a means for using tools had a profound influence in developing man's intelligence, so the rhythmical use of the body as a means of formal expression must have a profound influence in developing the soul of man.

It is thus not surprising to find a mature and well-developed art of self-expression through the dance, appearing at the commencement of the history of all peoples, keeping its place, as with the Greeks, after other more highly organized forms of expression have been developed. Still it is not strange that with the development of civilization the importance and significance of the dance should gradually diminish. It would be hard for a modern man to appreciate the feeling of the Indian, who is quoted as saying that he did not think the white man could have a religion because he had no dance. With the development of other forms of artistic expression, and the living under artificial conditions that civilized life requires, the dance has not only lost much of its artistic significance, but it has become debased in many cases and employed for unworthy ends. Among the Turks, for instance, the true believer would consider it a disgrace to take part in a dance, but he has no objection to the hiring of men who make a profession of dressing up like women and dancing. In Christian countries, there is not only a tendency not to recognize dancing as a legitimate form of artistic expression, but to consider it rather a frivolous pastime. That the degenerate and unwholesome forms of dancing that prevail so largely in civilized countries justify this feeling cannot be denied, at the same time there is distinct evidence of a widespread movement in which the attitude towards dancing is undergoing a radical change. The dance is being interpreted through the motives of primitive people, and recognized as a subtle form of artistic expression.

With this change, the employment of the dance as a school activity is rapidly growing. It is being recognized that musical ability and the various forms of plastic art, as well as language, require not only some natural aptitude, but considerable training, before they can become adequate mediums of expression. The child has in his body, like the primitive man, the fully developed means of self-expression, which needs but a slight amount of guidance and rhythmic organization to become an extremely effective means of self-expression. That this new treatment of the dance should present con-

In a New York City Park.

On the Roof of a New York City School.  
FOLK DANCING IN THE PUBLIC SCHOOLS.

siderable variety both as to motive and method would be expected. These could be characterized under three main heads, gradually changing into each other. In the first, the emphasis being placed largely on physical skill and precision, intellectual qualities are emphasized. Strength and endurance are developed in the second. The story-telling social side becomes prominent, and the dance presents fairly well-developed imitations of social activities, such as games and occupations. In the third, the bald imitations and ideas are replaced by symbolic movements, and the emphasis is placed on grace of body and movement. Such work as that taught by Jacques Dalerose of the Conservatory of Geneva, and that which is illustrated by Isadora Duncan, both represent this last type.

In schools, those dances conceived as physical exercises require precision in movement with no characteristic, except that they are done to music. They represent the first type. While not many schools employ folk dances with the introduction of jumping rope and movements with balls, handkerchiefs, and wands, those that do illustrate the second type. The dance represented by the third type is that in which body, mind, and spirit all unite through rhythmically coordinated forms as a means of self-expression. In this broad light, its value toward self, school dancing might be considered the most important of the child's activities. The rapid development of school dancing both on the Continent and in this country bears testimony to the growing importance of the subject.

A recent development of dancing in education is the introduction of folk dances from different countries in the physical training curriculum. The impetus for this new movement came in 1905 from the organization of the Girls' Branch of the Public Schools Athletic League (*q.v.*), of New York City Schools, for the purpose of providing recreative physical activities for the girls in the New York public schools by Dr. L. H. Guliek. The athletic activities previously organized for the boys were not considered suitable for girls, and classes in folk dancing were organized for them. This report on the principles that determine the educational value of the dances is as follows: "A study of the various dances used by the peoples in the different parts of the world quickly revealed the fact that a large number of these dances were not suited to the objects sought by the directors of the Girls' Branch. In some of the dances, for example, but few individuals are dancing at a time, the rest remaining still, thus involving a waste of time. An excellent example of this is the Virginia Reel, known also as Sir Roger de Coverley, a dance interesting in itself, excellent from the social standpoint, but lacking from the standpoint of physical exercise. Therefore, one of the first principles of selection was the picking out of those dances in which most of the individuals are active most of the time. Then

again some of the folk dances require for their performance more space than is commonly available in the gymnasium, the school basement, or the schoolyard. Thus space, as well as time considerations, are involved in the selection of each dance. Those dances are chosen which can be done by the largest number in the most limited space.

As far as possible dances have been selected which involve large movements of the body, arms, and limbs. This at once removes from the possibility of use such a large group of dances as that represented predominantly by the dances from Java, in which much of the work and symbolism is done by the forearm and wrist. Another consideration is that the postures involved in the dances shall be graceful and such as do not tend in any way to the forming of habits of movement or posture which are disadvantageous from the standpoint of health. As an illustration of the dances that have been avoided on this score may be cited those Indian dances in which for a considerable portion of the time the body is bent forward, the individual dancing with bent knees and in a crouching position. While it has not been possible to avoid these positions altogether, no dances have been selected in which these postures are predominant. Another most important consideration is that the dances shall be sufficiently simple, so that the children can learn them without an undue amount of training. It has also been found necessary to avoid using a large number of folk dances because of their unsuitability from the emotional standpoint. For example, the love dances of the East, however beneficial they may be from the standpoint of the bodily movements involved, are entirely unsuited from the standpoint of their emotional content and their relation to the morals of our civilization. It will thus be seen that the range of available folk dances meeting these various conditions is comparatively small. While the Girls' Branch teaches folk dancing, it is not by any means an indiscriminate teaching of all the folk dances of all peoples. The work consists only in the teaching of those folk dances which meet physiological, moral, and social conditions.

In considering these various questions, the dangers of dancing, it is believed, have been largely met. It is recognized that there are many people who are not only fearful of dancing, but who see in it genuine evil. That to which these people object is also objected to by those who have the management of the Girls' Branch. The experience of the last four years indicates clearly that the joyous freedom of these dances which are suitable from the various standpoints mentioned tends to minimize rather than to increase the dangers that were anticipated from the start. The attractiveness of the dance hall has been lessened for those who can have in school the beautiful Old World folk dances. Another and entirely different aspect of the case is also important. The parents of

the children, as they come to school and see their children taking part in these dances of the various races, have come to feel that there are ties between themselves and their own children and the historic past of their own peoples, which formerly had been lacking. The children, on the other hand, who are doing the dances which their parents before them have done as children and as young people, coming to understand something of the meaning of these dances, have had their ancestral history interpreted to them in a way which it is hardly possible to accomplish by any other means. These dances constitute a real tie between the old and the new.

The conservative treatment that has been given these folk dances has resulted in an almost entire absence of that criticism which is so commonly made against dancing. It was expected when folk dancing was undertaken by the Girls' Branch that there would be a considerable body of conscientious people who would seriously object to it. But when the basis of selection of the dances was seen, and the fact was realized that the dancing was tied up with the school and home life, that the dances were selected with reference to their suitability from the moral and social, as well as the physiological, standpoint, the critics have not merely refrained from criticizing, but they have joined those who were in support of the movement. Dancing, like every other form of art, has its possibilities of danger." (*Healthful Art of Dancing*, pp. 38-44.) The guidance of this movement in its early stages in New York in so markedly successful a way has been due not only to the wisdom of the Board of Directors of the Girls' Branch, but also to the fact that these directors were ladies of such standing in the community as to warrant confidence that what they would advocate would be thoroughly judicious and conservative. That folk dances are attractive to girls is shown by the growth of these voluntary classes; the first year there were 200 girls enrolled, the second year over 3000, the third year over 7000, and this year about 30,000. The number of girls participating was limited by the number of teachers available, for many more girls wanted to join, but could not be accommodated. As a result of the remarkable success achieved by these voluntary classes, instruction in folk dances has been adopted as a part of the physical training work in the high and elementary schools for girls of New York City. The movement is growing rapidly, as evidenced by the introduction of instruction in folk dancing in all the normal schools and summer schools of physical education, in playgrounds, and in many schools; and also by the publication of several books on the subject. Social dancing occupies a very small place in the educational curriculum. It is taught in many schools and colleges for girls because the present social customs require that every girl should possess this accomplishment. Other forms of dancing, such as national dances and

pantomime dancing, have a certain educational value, but they have not as yet received much consideration in education.

**DANTE ALIGHIERI.**—Italian poet and scholar, born in Florence in 1265. We have little information in regard to his life; he became involved in the political struggles of his native town, from which he was exiled in 1302 and wandered about Italy "like a ship without sail or helm, driven by the winds that grievous poverty exhales," until death overtook him in Ravenna in 1321. He was thoroughly versed in the philosophy and science of his age and was familiar with the writings of Aristotle and the better known among the ancient Latin authors. Charles Eliot Norton has well said that "Dante was born a student, as he was born a poet, and had he never written a single poem, he would still have been famous as the most profound scholar of his times. Far as he surpassed his contemporaries in poetry, he was no less their superior in the depth and extent of his knowledge." His *Commedia* is a very complete poetic and allegorical exposition of the medieval scholastic *Weltanschauung*, and deserves careful study as such. From the standpoint of education his *Banquet* (*Il Convito* or *Convivio*) is of especial interest. It represents the beginnings of a democratization and popularizing of scientific knowledge, rather alien to the earlier period, which has developed in recent times into our university extension and innumerable other plans for bringing science and literature within the range of those who are cut off from regular academic pursuits. The *Banquet* opens with Aristotle's dictum that "all men by nature de-

Permission of W. T. Loring & Co.

DARTMOUTH COLLEGE.

sire to know"; but, as Dante observes, a great part of mankind is bereft of the advantages of knowledge either by incapacity or by the pre-occupations and duties of domestic or political life. To those who might learn if they but had the chance he freely and generously brings such knowledge as he himself has been able to gain, carefully adapting it to their needs. The form he adopts is fantastic — a commentary on fourteen odes, which he had earlier written, which he proposes to explain in their literal, moral, and allegorical senses. He first sets forth a long argument in defense of the use of Italian instead of the Latin, which would have been more natural where a commentary was in question. Latin, he declares, is commonly acquired mainly with a hope of worldly gain; while goodness of mind is to be found chiefly among the "unlettered," that is to say, those who know only their mother tongue. Among these are "princes, barons, and knights, and many other noble folk, not only men but women." The work, which contains many interesting suggestions of Dante's range of knowledge and acquaintance with the Latin writers, was never completed. Only three of the fourteen odes are commented upon, and it may well be that the author was dissatisfied with the spirit and highly artificial character of the enterprise or that he became engrossed in his great poem.

Dante prepared a special treatise on the mother tongue, *De Vulgari Eloquentia*, in Latin, which shows a remarkable understanding of the several Romance tongues with which he was familiar and their relation to the Latin. He laid, in a way, the foundation of modern comparative philology. In his *De Monarchia*, he attempts to establish the normal and rightful unity of human government, as illustrated by the Roman Empire. He had none of the pessimism of Petrarch and the later Humanists, but thought of the world's history as a divine drama upon which the curtain had not yet fallen. Rome was as consecrated as Judea, for when David was born Rome was born: "Whereby the divine election of the Roman Empire is manifest enough; to-wit by the birth of the holy city being at the same time as the root of the family of Mary." In a little treatise, *Aqua et Terra*, commonly attributed to Dante, the author explains certain phenomena due to the sphericity of the earth, and the pamphlet may properly be reckoned with the *Banquet* as a contribution to popular science. Dante was still completely under the dominion of Aristotle; the Philosopher's words are "the supreme and most lofty authority"; he is "the master and artificer that has explained the goal of human life"; "the master and leader of human reason." Edward Moore has collected and tabulated all of Dante's references to classical authors, and it is clear that he was familiar with practically the whole range of Aristotle's encyclopedic writings in the Latin versions then available.

#### References:—

A bibliography of the literature relating to Dante would be well nigh interminable. Suffice it to say here that the Clarendon Press, Oxford, has published an admirable edition of his complete Italian and Latin works, edited by Edward Moore, whose *Studies in Dante* (First Series, 1897) is very useful. The best translation of the *Convivio* is that of Wicksteed, in *The Temple Classics*, with admirable notes. Charles Eliot Norton has given us a prose translation, with a few notes, of the *Commedia* and of the *Vita Nuova*; F. J. Church has translated the *De Monarchia* (1879), and A. J. F. Howell the *De Vulgari Eloquentia* (1900).

**DARBY, JOHN** (1804-1877). — An author of textbooks in science; was graduated from Williams College in 1831; and was for many years instructor of science in secondary schools and collegiate institutions in the South. He was for a time professor in Williams College, later in the Eastern Alabama College, and from 1869 to 1875 president of Kentucky Wesleyan College. His textbooks on botany and chemistry were widely used. W. S. M.

**DARK AGES, THE.** — See MIDDLE AGES, EDUCATION IX.

**DARK-AND-LIGHT WORK.** — The structural elements in the space arts are Line, Dark-and-Light, and Color. The term "Dark-and-Light work" is applied to exercises in tone and values; to a study of fine relations of tone. In a progressive system of structural art study, one would begin with composition in two values, following with three values, and finally with many values, or work in full tone.

See ART IN THE SCHOOLS; ART, METHODS OF TEACHING; DESIGN, etc.

**DARTMOUTH COLLEGE, HANOVER, N. H.** — The outgrowth of Moor's Indian Charity School, opened by Rev. Eleazer Wheelock at Lebanon, Conn., in 1754. A sum of £10,000 was collected in Great Britain and placed in trust. With the endowment Dr. Wheelock decided to extend the sphere of his work and to admit English students. The institution was moved to Hanover in 1785, a choice determined by the location of the town as a center and the probability of securing a charter. In the charter the name of Dartmouth College was adopted as a compliment to Lord Dartmouth, who was head of the Board of Trustees in England and took a great interest in the institution. Dr. Wheelock was the first president, with Mr. Bezaleel Woodward as his associate. As the work of educating Indians gradually disappeared from the program, Moor's Indian Charity School became a separate institution when the college was founded, and was maintained up to 1849. The support which came from England was withdrawn. A further difficulty was the struggle between the trustees of the college and the state for the control of the institution, decided in 1819 by the Supreme Court of the United States in favor of the trustees. (See

DARTMOUTH COLLEGE CASE.) In 1798 a medical school was established and is under the general control of the trustees of the college which grants the degrees. In 1857 the Chandler School of Science and Arts was established, and in 1893 became an intimate part of the college as the Chandler Scientific Course. (See TECHNICAL EDUCATION.) The Thayer School of Engineering was established in 1867, and while its funds are in charge of the trustees of the college, its general affairs are managed by a close corporation of overseers. The trustees also manage the Amos Tuck School of Administration and Finance, established in 1900 to provide courses in commercial education (*q.v.*).

Candidates for admission to the college must secure credit for fourteen and a half units; of these four units are elective in the case of candidates for the A.B. degree, and five units in the case of candidates for the B.S. degree. The examination of the College Entrance Examination Board is accepted, as well as certificates from preparatory schools which have been approved by the college. For entrance to the Dartmouth Medical School candidates must have completed two years of college work. The Thayer School offers a two-year course in engineering, which may be entered upon in the senior year, thus making a five-year course in all. The requirements in the Amos Tuck School are similar. The enrollment for 1910-1911 was 1229, including 1165 students in the college; 41 in the medical school; 43 in the Thayer School; 34 in the Tuck School. The faculty of the college alone consists of twenty-four professors, twenty-four assistant professors, and twenty-three instructors. Ernest Fox Nichols, D.Sc., LL.D., is the president.

**DARTMOUTH COLLEGE CASE.**—A *cause célèbre* in United States constitutional law, affecting not only college administration, but also industrial and commercial corporations. Dartmouth College (*q.v.*) had received a charter from the British governor in 1769, and held considerable property, to which additions were made both by the state of New Hampshire and the state of Vermont. The executive functions were exercised by a Board of Trustees which was self-perpetuating. In 1816 the Governor of New Hampshire invited the legislature to amend the charter of the college on the grounds that the state had made contributions to its funds, that the college was the leading learned institution of the state, that the existing charter contained principles congenial to monarchy in the constitution of the Board of Trustees, and that a reform in accordance with the spirit and genius of free government should be made. Accordingly a law was passed by which

the Governor and Council were empowered to appoint a Board of Overseers, and the Governor to appoint eleven additional trustees. The title of the institution was to be changed to University. The old trustees were not consulted in the matter, and refused to accept the amending law, although in principle they were not opposed to closer connection with the state. Accordingly for a time the two bodies, the university and the college, stood side by side. The college trustees, however, brought an action against the officers of the new board for the recovery of property which had been seized. The case was carried to the supreme court of New Hampshire, which decided against the college. It was determined to carry the matter to the Supreme Court of the United States, and it was tried before the full court of seven justices. Apart from its legal importance the case is notable for the arguments of Daniel Webster on behalf of the plaintiffs. The decision of the court was issued in 1819 with the agreement of all the justices but one. The acts of the New Hampshire legislature were declared unconstitutional and void; the college was held to be a private and not a public corporation, that had been created by a charter granted to the trustees and their successors. The decision was based on the constitutional declaration that "no state shall pass any . . . law impairing the obligation of contracts." This case gave security to all classes of chartered institutions against state interference. The founder in this instance had aimed to secure the freedom of the college from local interference and control, and this purpose was upheld legally. The rights of private and corporate property were safeguarded.

**DARWIN, CHARLES.**—Born at Shrewsbury on Feb. 12, 1809, and died at Down on Apr. 19, 1882. His father was Robert Waring Darwin, a successful physician (1776-1848); his grandfather was Erasmus Darwin, with whom he had many mental traits in common. His early school days (1818-1825) were spent at Dr. Butler's school at Shrewsbury. Even at this early age his taste for natural history and collection showed itself. His work in this school, being chiefly classical, was distasteful to him, and in October, 1825, his father removed him and sent him to Edinburgh University to begin the study of medicine. The work at Edinburgh was not enjoyed by Darwin. He became fast friends, however, with older university men, who encouraged him in the study of geology and

zoölogy. While there, he prepared and read one or two zoölogical papers before the Plinian Society. After spending two years at Edinburgh, it became evident to Darwin that the life of a physician would be distasteful to him, and his father proposed that he should become a clergyman. He went to Cambridge in 1828 to begin work upon his B.A. degree, and passed his examinations for it in 1831. During his stay at Cambridge, as at Edinburgh, he got most enjoyment from his naturalist work (especially in the collection of beetles), and in hunting and fishing. He himself says that his time was sadly wasted in both institutions. His five-year trip with Captain Fitz-Roy as naturalist on board the *Beagle* (1831-1836) gave the first pronounced impetus toward a scientific career, and furnished him with an enormous amount of zoölogical and geological material. Even before his return from this trip, he was well embarked upon his scientific career. In 1839 Darwin married his cousin, Emma Wedgwood, and in 1842 he settled at Down, at which place most of his writing and scientific labors were done. A large part of his time was spent in publishing the results, geological and biological, of his trip in the *Beagle*. In 1846 he began his laborious work upon the Cirripedia, which occupied him eight years. Even as far back as 1838 (the date of his reading Malthus on *Population*), however, his mind had begun to work upon the problems connected with descent. From that time until the appearance of the *Origin of Species* in 1859, his mind was never wholly free from these problems. Notwithstanding the ill health which clouded his whole adult life, Darwin was a prolific writer, and published upon a wide series of topics. His best known works are, *A Naturalist's Voyage Around the World*, *The Structure and Distribution of Coral Reefs*, *The Origin of Species by Means of Natural Selection*, *The Descent of Man, Emotional Expression of Man and the Lower Animals*.

In common with Erasmus Darwin and with Lamarck (*q.v.*), Charles Darwin believed in descent; that is, that the complex species have descended from less complex species. He, however, was the first biologist to advance a clear and logical hypothesis of the mechanism of descent, which was at the same time supported by an enormous mass of observed biological data. His observations in systematic zoölogy gave him the starting point for his theory. When the individual members of any given species are examined, they show numerous indefinite slight peculiarities which cannot be accounted for by inheritance from either parent, nor from any remote ancestor. That these slight peculiarities were heritable was supposed by Darwin to be a fact of everyday observation. A second point in his theory is given when we consider the fact that organisms, regardless of the mode of the reproductive process, multiply in a geometric ratio. This leads logically to the conclusion that in a short time food and actual

standing room would soon be impossible to obtain, unless some checking process occurred (the doctrine of Malthus). Actual observation, however, shows that the number of any given species remains approximately the same in any given locality. Consequently a checking process occurs which takes the form of a more or less pronounced struggle both among the different species and among different individuals of the same species. In this struggle, in which only the fittest survive, the possession by any member of a species (or by the species as a whole) of slight variations which put their possessor at even a slight advantage over his adversaries, will on the average and in the long run lead to the survival of that individual (or species). And since only those organisms which possess these favorable variations survive, it is obvious that their progeny will likewise possess them, and thus a definite step in differentiation occurs. In such a manner does Darwin suppose that the various adaptive structures arise. These structures may be slight, but they are first steps toward "slight varieties"; these in turn become differentiated into more strongly marked and permanent varieties, the process culminating finally in sub-species and in true species.

The process just described is the main prop of the selection theory. Two other auxiliary theories are urged by Darwin in support of it: the sexual selection theory, and the "use and disuse" hypothesis of Lamarck. The notion of sexual selection was also forced upon Darwin by the apparent logic of systematic observation. Many of the characters possessed by the individuals of any species (so-called secondary sexual characters) are of no use in any actual struggle for food, shelter, possession of the female, etc., and hence their survival value is to be sought for elsewhere. Such secondary sexual characters may be illustrated in birds by the differences in their coloration, in the size, shape, and arrangement of their plumage, in certain of their appendages, and in the musical character of their notes; and in other animals by differences in odor, etc. In order to account for the origin of these characters, Darwin supposed that their possession aided in the selection of a mate; the mate (especially true of the female's choice of the male) would be chosen by reason of its greater attractiveness. Many other factors are considered by Darwin in his species theory, such as the effect of differences in climatic conditions, isolation, the bearings of geographical distribution, the occurrence of "sports," the theory of pangenesis, etc.; but the above summary statements give the gist of a theory which would account in a nonteleological way for the gradual transition from ameba to man.

The influence of Darwinism upon the various separate sciences and arts has been of so complex and intimate a character that a full discussion of it alone requires encyclopedic treatment. It suffices here to point out briefly the bearing of this great biological movement upon psychol-

ogy and education. The genetic treatment of psychological and educational problems may well find its origin in the gradual permeation of Darwinism into psychology. Darwin furnished a new method of treating mental problems, namely that of studying their growth both phylogenetically and ontogenetically. Before the advent of this movement, emotion, instinct, and impulses, indeed, all of the psychological processes, were merely grouped and classified. This statistical and classificatory treatment of psychological processes has many points of similarity with the Linnean method in biology. After the advent of Darwinism, instincts and impulses, perception and imagination, were looked upon as weapons of adaptation, as having definite survival value, and as putting their possessor at an advantage in the struggle for existence. (See article on INSTINCT.) They were looked upon as growth processes which might be studied in the incipient as well as in the more advanced stages. Indeed, it then became evident that the advanced stages — the complex psychological processes — could not be thoroughly understood without carefully studying their origin and growth. Darwin's influence in this realm is most clearly traceable in the two branches of psychological inquiry known as child psychology and animal psychology. It may safely be said that a Darwin was the necessary forerunner of these two branches of study. They depend peculiarly upon the view that makes consciousness not a fixed set of entities, but a developmental process which is clearly traceable both in phylogeny and in ontogeny. In the main this viewpoint is best expressed in *The Descent of Man* and in his *Expressions of the Emotions*. The thesis which he there maintains is that animals are endowed with mind, and that the mental life of animals becomes more complex as we ascend the scale of animal life. Darwin's work in this field was continued by Romanes, Lindsay, Lubbock, Father Wasmann, and many others. Their work, lacking the painstaking and critical spirit of Darwin, descends often into a more or less servile eulogy of the animal mind. Lloyd Morgan in the late eighties broke away from this traditional method of eulogy, and reexamined the mental life of animals from an experimental standpoint. Thorndike in America continued Morgan's work, and helped largely to lay the foundations for the now well established branch of inquiry which is known as "animal behavior" or "animal psychology." This subject, at least that branch of it which deals with the activities of the higher animals, originated very distinctly with the Darwinian movement.

These phylogenetic studies in mind are paralleled by equally extended ontogenetic researches — as is shown in the widespread psychological and educational movements which are found crystallized in the various writings on child psychology, child study, mental development, and studies in adolescence. The principal

names associated with this movement are those of Preyer, Perez, and Stern in Germany, and Baldwin, Stanley Hall, Major, and Miss Shinn in this country. These investigators have materially increased our knowledge both by the accumulation of facts and by the introduction of experimental methods. J. B. W.

**DAUNOU, JEAN CLAUDE FRANÇOIS** (1761–1840). — Scholar, historian, statesman. Teacher in the colleges of the Oratory before the Revolution, author of an education bill in 1789, active participant in the debates on public instruction before the Convention, in the Council of the Five Hundred, and in the Chamber of Deputies during the July Monarchy. His *Essai sur l'instruction publique* (1793) was completed by his *Projet analytique d'un loi sur l'instruction publique*, one of the paper schemes of the Convention for extending public education, which prepared the way for the more mature plan of Lepelletier. Daunou was subsequently professor of history at the Collège de France (1819–1831), giving there a course in history, later appearing in twenty volumes (1842–1849). Also author of *Plan d'éducation présenté à l'Assemblée nationale au nom des instituteurs publics de l'Oratoire* (1790).

**DAVIDSON COLLEGE, DAVIDSON, N. C.** — Founded in 1837, and conducted under the auspices of the Presbyterians of North and South Carolina, Georgia, and Florida. Classical, scientific, postgraduate, and nonresidential courses are offered. Admission to courses leading to degrees is by an examination requiring fourteen units of high school work. Certificates from teachers are accepted in lieu of the entrance examination. There is a faculty of twenty-four members.

**DAVIDSON, ROBERT** (1750–1812). — Educator; graduated from the University of Pennsylvania in 1771. He was instructor in that institution from 1771 to 1775, and professor from 1780 to 1784. For the next twenty years he was professor in Dickinson College, and from 1804 to 1809 president of Dickinson. He was the author of *Epitome of Geography in Verse*, published in the same year as Morse's first textbook (1784), and of several works on religious education. W. S. M.

A GROUP OF AMERICAN EDUCATORS.

DAVIDSON, THOMAS. — Born Oct. 25, 1840, near Fetterangus, Aberdeenshire, Scotland, of very humble antecedents. He was prepared for college by Robert Wilson, the parish schoolmaster of Old Deer, and was graduated from King's College in 1860, after having won the highest honors in Greek, the Simpson Prize. He was rector of the Old Aberdeen grammar school from 1860 to 1863, and then went to England, where he served as classical master, first at Tunbridge Wells and then at a military school in Wimbledon. In 1866 he came to America, and after teaching for a year in the Collegiate Institute of London, Ont., was appointed to a position in the public schools of St. Louis, where he soon rose to be principal of the Branch High School. His intimate friendship with Dr. William T. Harris and other members of the group of thinkers whose organ was *The Journal of Speculative Philosophy* exerted a lasting influence on all of Davidson's subsequent thinking, especially in the philosophical interpretation of art and literature and their function in education. Besides his contributions to this journal, Davidson also wrote for the *Radical* (Boston), the *Round Table* (New York), and the *Western Educational Review* (St. Louis). Of the last mentioned he was also for a time chief editor.

In 1875 Davidson removed to Cambridge and began a career as a private tutor in a number of distinguished Boston families. This enabled him to travel extensively, and from 1877 to 1884 he spent most of his time in Greece and Italy. His extensive walking tours throughout Greece and his association with Dr. Schlieman, who was then conducting his excavations, gave Davidson a vast and intimate knowledge of the conditions of ancient Hellenic culture. (See his *Parthenon Frieze and other Essays*, London, 1882.) In Italy he was attracted by the philosophy of Rosmini (*q.v.*), and lived a good deal with the members of the Rosminian Order. Rosmini's educational theories and the pedagogic practices of his Order influenced Davidson profoundly. He translated and edited Rosmini's *Philosophical System* (London, 1882), and also translated the latter's *Psychology* (3 vols., London, 1883). While in London in 1882, he founded the Fellowship of the New Life, from which the Fabian Society was an offshoot. He also helped in the organization of the Aristotelian Society of London, of which he continued to be corresponding member to the end of his life. On his return to America in 1884 he lectured before the Concord Summer School of Philosophy (*q.v.*) and then tried to establish similar schools of his own in St. Cloud, N. J., and at Farmington, Conn. In 1889 he bought a farm near Keene, N.Y., and established on it the Glenmore Summer School for the Culture Sciences, which has been continued. In 1898 Davidson became associated with the People's Institute and the Edu-

ational Alliance of New York, and conceived the idea of establishing a Breadwinner's College, modeled on the London Polytechnic Institute, and the popular universities that were then springing up in France. His death (Sept. 14, 1900) prevented the elaboration of his plan. His work, however, has been continued by his pupils, and an account of the aim and character of this movement can be found in his posthumously published *Education of the Wage Earners* (Boston, 1904).

Davidson's interests in education were predominantly philosophical and social rather than pedagogic. He believed that an inspiring outlook on the great world drama was of greater importance to the teacher than a knowledge of empirical psychology. Education meant to him the whole process of evolution so far as it can be put under conscious control, and he insisted that no reasonable system of education could be established without a rational system of philosophy back of it. His own philosophy, however, underwent a number of tempestuous changes as reflected in his life as a wandering scholar. Moreover, his interests were too wide and his sympathies too passionate and mobile to allow him to express himself with studied consistency. In the main, however, he was an idealist with a tendency to ethical rigorism.

During the period of Rosminian influence, — to which belong his *Prolegomena to Tuwvnyson's In Memoriam* (Boston, 1889), *Aristotle and Ancient Educational Ideals* (New York, 1892), as well as the *Education of the Greek People* (New York, 1894), — he held to a doctrine of a "supernatural sense" or "faith as a faculty," which gives us an immediate experience of a spiritual or divine order. In his later views (1895–1900), however, he became a thorough gnostic, believing that all the truths necessary for a theory of life and education — of which freedom and immortality were the most important — could be demonstrated with apodeictic necessity. The system which he thus developed and which underlies his *Rousseau and Education according to Nature* (New York, 1898), and his *History of Education* (New York, 1900), as well as the important article on Education as World-Building in the *Educational Review*, November, 1900, is a form of epistemologic or subjective idealism of a pluralistic kind, which he himself called apöirotheism. According to that view there is no existence except that of a group of "desiderant feelings," *i.e.* free and eternal souls, whose interaction produces the entire universe.

Davidson's position as a free lance made him a very stern critic of our present educational system. His own constructive program is found in the concluding chapter of his *History of Education*, and in Chapter III of his *Education of the Wage Earners*. (For portrait, see opp. page.)

**DAVIES, CHARLES** (1798-1861). — The author of a well known and widely used series of textbooks on mathematics; was born at Washington, Conn., on the 22d of January, 1798. He was graduated from the United States Military Academy at West Point in 1815. For twenty-one years he was in charge of the department of mathematics in that institution, and during this period he prepared his textbooks. Because of impaired health he resigned his position in 1837 and spent the next two years in study and travel. Upon his return he was two years professor of mathematics in Trinity College and two years at the Albany Normal School. He was professor of higher mathematics in Columbia University from 1857 to 1865. His textbooks cover the entire field of mathematics and include a *Cyclopaedia of Mathematical Science* (1855) and an account of *The Metric System* (1870). He died at Fishkill, N.Y., in 1876. W. S. M.

**DAVIES, SAMUEL** (1724-1761). — Educator, who succeeded Jonathan Edwards as the fourth president of Princeton, then the College of New Jersey; was self-educated. For several years he was engaged in religious and educational work in Virginia, and in 1753 he was sent to Great Britain by the trustees of the College of New Jersey to solicit funds. He was elected president of the college in 1759, and served until his death, two years later. W. S. M.

**DAVIS, EMERSON** (1796-1866). — Educator; born at Ware, Mass., on July 15, 1798, and was graduated from Williams College in 1821. He was for a time tutor in Williams College; principal of the Westfield Academy from 1822 to 1836; principal of the State Normal School at Westfield from 1844 to 1846, and member of the State Board of Education in Massachusetts from 1837 to 1847. Author of *Franklin Intellectual Arithmetic* (1833) and *The Teacher Taught* (1839). He died at Westfield, Mass., in June, 1866. W. S. M.

**DAVIS, HENRY** (1771-1852). — The second president of Hamilton College; was graduated at Yale in 1796. He was for seven years a tutor of the ancient languages at Williams and Yale Colleges; professor of Greek in Union College from 1806 to 1809; president of Middle-

bury College from 1809 to 1817, and of Hamilton College from 1817 to 1833. He was active in the American Lyceum Association (*q.v.*) and its first president. W. S. M.

**DAWSON, WILLIAM** (1704-1752). — The second president of William and Mary College; was born in England and graduated at Queen's College, Oxford, in 1725. He was a professor in William and Mary from 1729 to 1743, and president of the college from 1743 to 1752. His brother, Thomas Dawson (1707-1761), who had made several efforts to organize schools for Indian children in Virginia, was president of William and Mary from 1755 to 1761. W. S. M.

**DAY, HENRY NOBLE** (1808-1890). — The author of sixteen textbooks and several works on education; was graduated from Yale College in 1828. He was for several years a tutor in the college, and then studied in Europe. For eighteen years (1840-1858) he was professor in the Western Reserve College, and for six years (1858-1864) president of the Ohio Female College. His textbooks include works on elocution, bookkeeping, rhetoric, logic, psychology, and ethics, and his professional works *The Science of Education* (1889). W. S. M.

**DAY INDUSTRIAL SCHOOLS.** — See INDUSTRIAL SCHOOLS, DAY.

**DAY, JEREMIAH** (1773-1867). — President of Yale College for thirty years; was graduated from that institution in 1795. He was several years principal of the Greenfield High School, and later instructor in Williams and Yale. From 1801 to 1817 he was professor of natural philosophy at Yale, and from 1817 to 1846 president of the college. Author of *Algebra* (1811), *Trigonometry* (1815), and of works on the freedom of the will and science. W. S. M.

**DAY, THOMAS** (1748-1800). — Author; educated at Charterhouse and Oxford; called to the bar in 1775, but never practiced law. He, like his great friend, R. L. Edgeworth, the father of the authoress, was early attracted by the doctrines of Rousseau and became an ardent adherent of the demand for simplicity and the return to nature. Inspired by humanitarian feelings and the belief that environment was stronger than heredity, a position somewhat inconsistent with his other views, he adopted two young girls, one from a foundling hospital and the other from an orphan asylum. His purpose was to bring them both up and to marry one eventually. The experiment was not successful. Day is best known as the author of *Sandford and Merton*, a book which has for more than a century been a favorite with English boys. This delightful book was written in a missionary spirit, to portray the

author's conception of perfect manliness and to inculcate the virtues of independence, courage, and humanity.

**DEAF, EDUCATION OF THE. — Historical Development.** — While it is doubtless true that the number of deaf persons in the world has always borne about the same proportion to that of the hearing, it is only within the past few centuries that anything has been done toward their education or the amelioration of their condition. Passing over the few references that occur in the Scriptures and early Greek writers, the well known couplet of Lucretius may be quoted, —

“To instruct the deaf no art could ever reach,  
No care improve them, and no wisdom teach,”

as indicating the estimation in which they were held in the ancient world.

Perhaps the earliest reference to the education of a deaf person is found in the writings of the Venerable Bede (*q.v.*), who tells how St. John of Beverly taught a young deaf man to speak and read the lips. It was, however, looked upon more as a miracle than education. A number of other cases are also mentioned by some later writers, but much doubt is expressed because of the seeming impossibility of the feat. It was not until the sixteenth century that Jerome Cardan (*q.v.*) (1501–1576) of Pavia, an eccentric genius and speculative philosopher, with probably no actual knowledge of the deaf, wrote: “Writing is associated with speech, and speech with thought, but written characters and ideas may be connected without the intervention of sounds”; and from this he drew the conclusion that “the instruction of the deaf is difficult, but it is possible.” Cardan also suggested the possibility of teaching the blind to read by the sense of touch. The first recorded teacher of the deaf is Pedro Ponce de Leon (1520?–1584), a Spanish monk of the Order of St. Benedict. In a legal document written in 1578 he says, “I have had for my pupils, who were deaf and dumb from birth, sons of great lords and notable people, whom I have taught to speak, read, write, and reckon.” He also taught Latin, Greek, and Italian, and one of his pupils “was ordained, and held office and emolument in the Church and performed the service of the Canonic Hours.” If Ponce de Leon left any written account of his method, it has not come down to us, but we have reason to believe that he began by teaching the written word first, following it with the spoken form.

The first work on the education of the deaf that we have is from the hand of Juan Pablo Bonet (d. 1629?), also a Spaniard, whose method was similar to that of de Leon, for he first taught his pupils to write the letters, and then

gave them their phonetic values. In his book he says, “The scholar is dumb because he is deaf, and cannot by any means have his hearing restored. But by sight he can acquire the knowledge lost by deafness.” In teaching speech he “exercised the scholar in placing his tongue, teeth, and lips in the positions suitable to the articulation of each letter; then he made them exhale the air necessary for the production of voice.” Bonet also states that “the language of action is a natural language,” and made use of signs as well as a manual alphabet. Among the British writers on the subject were John Bulwer (fl. 1654), a purely philosophical writer, and William Holder (1616–1698), John Wallis (1616–1703), and George Dalgarno (1626?–1687), all successful teachers of speech to the deaf, who left descriptions of their methods. John Conrad Anaman (1669–1724), a native of Switzerland, resident in Haarlem, Holland, was another successful oral teacher, and his writings did much to influence the methods that were adopted not long after in Germany. The first teacher in France was Jacob Rodrigues Periere (1715–1780), a Spaniard, who settled at Bordeaux in 1741.

Up to the middle of the eighteenth century all the instruction had been of a private nature and individual. The method employed was oral supplemented by writing and in some cases by a manual alphabet. With the establishment at Paris in 1760 of a school for poor deaf-mutes by Charles-Michel de l'Épée (1712–1789) a new era in the education of the deaf began, and a new method was introduced. In the same year that the Abbé de l'Épée opened his school in Paris, Thomas Braidwood (1715–1806) began a work at Edinburgh that led to the establishment of schools in Great Britain. A few years later (1778) Samuel Heinicke (1729–1790) opened at Leipzig, under the patronage of the Elector Frederick Augustus of Saxony, the first school in Germany and the first in the world to receive government recognition. The Paris school was taken over by the government as the National Institution in 1791. But in Great Britain the instruction of the deaf remained a monopoly of the Braidwood family for fifty-nine years. All three of these schools were at their foundation oral. It was only the necessity of instructing sixty or more pupils with almost no assistance that caused de l'Épée to devise his system of signs as a more rapid means of teaching. It was with evident regret that he abandoned the oral method, for in 1776 he wrote: “Never will the world train its fingers and eyes to have the pleasure of conversing with the deaf and dumb. The only serious means of giving them back to society is to teach them how to hear with their eyes and speak with their tongues.” The Braidwood school became known in America, and, among others, Francis Green of Boston sent his son across to be educated. In 1783 Green wrote his *Vox Oculis Subjecta: A dissertation on the*

*most curious and important art of imparting speech, and the knowledge of language, to the naturally deaf, and (consequently) dumb; with a particular account of the Academy of Messrs. Braidwood, of Edinburgh.*" In 1812 John Braidwood, a grandson of Thomas, came to America and attempted to establish a school at Cobbs in Virginia, but met with failure because of his personal habits.

The first real work in America began in the winter of 1814-1815, when Thomas Hopkins Gallaudet (1787-1851) of Hartford, Conn., became interested in Alice Cogswell, the deaf and dumb child of a neighbor. This led to the sending of Mr. Gallaudet to Europe to learn the art of teaching the deaf, and naturally he went to England. At both London and Edinburgh he encountered the Braidwood monopoly, and was refused the instruction he sought except upon terms that he was obliged to decline. Returning from Edinburgh to London, he accepted the invitation of the Abbé Sicard, (1742-1822), de l'Épée's successor, who was spending "the hundred days" in England, to go with him to Paris and study his methods. Coming back to America in 1816, Gallaudet opened the school at Hartford in April, 1817, with twenty pupils. Laurent Clerc (1785-1869), one of Sicard's best pupils, accompanied Gallaudet to America, and did much for the education of the deaf both at Hartford and elsewhere. Of course, as the training of Gallaudet and Clerc had been in the French or sign method, that was the method introduced into the United States, and by teachers trained at Hartford it was carried to the schools that were soon established in the other states, as New York in 1818, Pennsylvania in 1822, Kentucky in 1823, Ohio in 1827, and so on, until to-day every state, with the exception of New Hampshire, Vermont, Delaware, Wyoming, and Nevada, has one or more schools. In 1857 the Columbia Institution at Washington was incorporated, and in 1864 the National Deaf-Mute College, the only institution for the higher education of the deaf in the world, was opened with Dr. Edward Miner Gallaudet, the youngest son of Thomas Hopkins Gallaudet, as its president. The name was afterwards changed to Gallaudet College (*q.v.*) in honor of America's pioneer teacher. Meanwhile the followers of Heinicke in Germany had developed a pure oral method, excluding all signs and manual spelling. Horace Mann (1796-1859), the Secretary of the Massachusetts State Board of Education, made a tour of Europe in 1843, and reported on what seemed to him the superiority of the German method. This report called forth much criticism from the sign teachers of America, and not a few went abroad to see for themselves; but as they did not agree in their conclusions with Mann, little change resulted.

There was considerable agitation in Massachusetts, the leaders being Dr. Samuel Gridley Howe (1801-1876) and Gardiner Greene Hub-

bard (the father of a deaf child). In 1867 John Clarke offered to endow a school for the deaf in that state, and the Clarke Institution (now the Clarke School) was opened under the charge of Miss Harriet B. Rogers, who for two years had had a private school at Chelmsford, near Boston. Miss Rogers had begun her work with the deaf about five years before. The method of the Clarke School has always been oral. In the same year, 1867, an oral school under Jewish auspices was opened in New York City by Bernhard Engelsmann. This was the beginning of the present New York Institution for the Improved Instruction of Deaf Mutes. Two years later a day school for the deaf was opened in Boston and named in honor of Horace Mann. Of course the method was oral. With the establishment of these schools a bitter controversy arose. It was claimed that articulation teaching was not a means of instruction, but only a branch; that it was adapted only to a small number of pupils; that it was costly (requiring smaller classes); that it was difficult, disagreeable, and wearisome to the pupils; that it could not be used as a means of religious instruction; and that it was imperfect and unreliable as a means of communication. But in spite of this opposition most of the larger schools introduced speech teaching and lip reading for a selected few of their pupils, chiefly those who had learned to speak before becoming deaf. The Second International Convention of Instructors of the Deaf held at Milan, Italy, in 1880, declared itself unqualifiedly in favor of the pure oral method, and the Eleventh Convention of American Instructors at Berkeley, Cal., in 1886, adopted the following resolution: "That earnest and persistent endeavors should be made in every school for the deaf to teach every pupil to speak and read from the lips, and that such efforts should only be abandoned when after thorough tests by experienced and competent teachers it is plainly evident that the measure of success attainable is so small as not to justify the necessary amount of labor." At the Twelfth Convention (New York, 1890) the oral teachers present organized a new body devoted especially to speech work, and in the fall of that year a charter was obtained from the State of New York for the American Association to Promote the Teaching of Speech to the Deaf. The objects of this Association are "to aid schools for the deaf in their efforts to teach speech and speech-reading by providing schools for the training of articulation teachers; by the employment of an agent or agents who shall, . . . by conference with teachers and others, disseminate information concerning methods of teaching speech and speech-reading, and by using all other means as may be deemed expedient, to the end that no deaf child in America shall be allowed to grow up 'deaf and dumb' or 'mute' without earnest and persistent efforts having been made to teach him to speak and read the

lips." Dr. Alexander Graham Bell was chosen President of the Association. In the furtherance of its objects the Association has held a number of summer meetings and has entered into an agreement with the Clarke School by which it makes use of the normal class of that school for the training of teachers. At the Fourteenth Convention of American Instructors (Flint, Mich., 1895) a constitution was adopted, and later a Federal charter obtained. The California Resolution was reiterated, and a declaration added that the Convention was "committed to no particular theory, method, or system, adopting as its guide the following motto: 'Any method for good results; all methods, and wedded to none.'" Dr. Edward Miner Gallaudet was elected president. A normal class is maintained at Gallaudet College for the training of teachers on the lines laid down by the Convention.

**Classification of Deaf Persons.** — According to the census returns of the United States and the British Isles there is one deaf person in every 1600. About 40 per cent of the deafness is congenital, and the rest the result of disease or accident. The congenitally deaf are those deaf from birth, and because of their deafness they are dumb or mute. With these are usually included those who became deaf before speech was acquired. The semi-mute are those who became deaf after speech was acquired. Their ability to speak and use language varies with the age at which deafness occurred, and because their speech is more or less imperfect they are termed semi-mute. The semi-deaf are those who have some hearing, often enough to help in the acquisition of speech and language, and the modifying of tones. It should be evident that these three classes require different methods of instruction, but in most schools they receive practically the same. It was probably in Denmark that the first real attempt was made to adapt the instruction to the needs of the pupils. There all new pupils spend the first year together being tested for classification. The semi-deaf and semi-mute are classed together, and the remainder are divided into A, B, and C groups according to their mental capacity. At the beginning of the second year these four groups are sent to different schools, and all are taught orally except the C pupils, with whom silent methods are used. But as all semi-deaf and semi-mute pupils are not equal mentally, there should be a subdivision of that group also. In mental capacity the deaf differ but little from the hearing; there are among them brilliant minds, good minds, fair and feeble minds. The feebleness of mind is often the result of the disease that caused the deafness.

The feeble-minded and backward deaf are a great hindrance to the progress of their classes, and many are discharged as not fit subjects for instruction. If their number be sufficiently great, they may be grouped by themselves, but even then their presence in the school is unde-

sirable. In states like New York and Pennsylvania, where there are several schools, the Danish classification might be easily copied. But if it were not followed in all its details, provision might at least be made for the backward deaf; they are as deserving of proper treatment as the deaf-blind, and are far more numerous.

**Methods of Instruction.** — In the education of the deaf the aim is the same as that of all other education, *i.e.* the imparting of knowledge and the developing of mind. There are two principal methods by which this is done, the manual, or (as it is called in Great Britain) silent, method and the oral. The latter employs the natural method of human communication, — speech, — and substitutes for hearing the reading of speech by sight from the movement of the lips. The former uses natural or conventional gestures and finger spelling in place of speech. Both methods employ writing and textbooks. In some schools both oral and manual instruction are given. If both methods are used in the same classes, the schools are called combined method schools; if some classes are taught orally and some manually, they are combined system schools. As the manual method was the first to be used in the schools of America, and as it is still employed in most of them, modified more or less by oral teaching, it will be described first. The manual method employs movements of the hands and fingers to express ideas in place of spoken words. These movements may be gestures, either naturally pantomimic or conventionalized, or alphabetic symbols used for spelling words. As examples of the natural signs the following may be cited. *Eat*: the fingers and thumb of the right hand brought together and placed to the lips. *Sleep*: the head inclined and cheek laid on palm of right hand. *House*: the tips of the fingers of both hands placed together outlining a roof. If these three be combined in the order *House-Eat-Sleep*, we have the conventionalized sign for *Home* (the place of eating and sleeping). The drawing of the forefinger horizontally across the mouth from base to tip very naturally suggests "syrup" or "molasses," but when the movement is from tip to base it means "a lie." The forefinger held vertically before the mouth and then thrust forward means "truth."

Some signs, called initial signs, consist merely of the first letter of the word in the manual alphabet. "Character" is the letter C over the heart, and the days of the week are the initials S, M, T, etc., combined with a circular movement of the hand. If the tips of the fore and middle fingers of the right hand be placed on the back of the left list, as if pricking a potato with a fork, the meaning is "Ireland." In England the thumb pointed toward a person or thing means "good," while the little finger means "bad." An authority on the sign language says that he has used it with an American

DEAF

Indian, a Hawaiian, a Chinese, the deaf in various parts of the United States, in England, Scotland, France, Germany, Switzerland, and Italy. If by sign language natural pantomime is here meant, it is quite possible, for natural pantomime can be readily understood by any one. Conventionalized signs, however, must be learned even by the deaf, of whom it is claimed by some that signs are the natural language. The order in which signs should be

Single-handed.

DEAF

Amen." This inverted order of signs, while perhaps the natural order of ideas, is undoubtedly a hindrance to the acquisition of a knowledge of written English. The alphabetic symbols, easy to learn and use, present real language in its proper form. In the Western New York Institution at Rochester, Dr. Zenas Freeman Westervelt has developed a method that combines the manual alphabet and speech, but excludes signs.

Double-handed.

THE MANUAL ALPHABET.

made has been much discussed by teachers, some advocating the order of the words, and others the "natural" order. The following is the Lord's Prayer as rendered by an acknowledged master of the sign language: "Father our Heaven in; name Thy hallowed; kingdom Thy come; will Thy do Earth on Heaven in same. Yesterday to-day to-morrow bread give eat enough. Debts our forgive we others debts their forgive same. Temptation lead in not. Sin trouble sorrow deliver. Kingdom Thy power Thy glory Thy forever and ever.

The manual alphabet in both its single-hand (French and American) and double-hand (English) forms, is too well-known to need description. Plates illustrating the two forms are to be found in all dictionaries and encyclopedias, and most children at school learn to use it surreptitiously as a substitute for the forbidden whispering. But few remember it after their school days are over, and thus lose a method of communication that might be of great service and comfort in case of sickness or accident. Robert Louis Stevenson is said to have used it when too weak

to articulate. The oral method was the one, as was pointed out above, employed by the earliest teachers who for the most part taught single pupils. It has been very successfully employed in our own times in the home training of deaf children by parents and friends often illiterate and absolutely ignorant of any other means of communicating with the child than by talking to him.

In the teaching of speech to the deaf two methods are employed, the element and the word. These methods are also used in teaching reading to hearing children, but the problem is not the same. The hearing child can already speak the word. He is shown a picture of a cat and can call it by name; he has only to be taught that a certain combination of three letters is another picture of the cat. The deaf child cannot speak the word, and is made to attempt the imitation of the three sounds together, and perhaps succeeds, but he is incapable of pronouncing the word "tack," which contains the same three sounds, and it must be taught as a new word. By the element method the powers of the letters are taught, and the child is shown how to resolve words into their component parts. For no one can pronounce a word until he can pronounce the beginning, the middle, and the end. In teaching young deaf children to speak, the attention is first attracted by gymnastic movements of the body and its parts, which are imitated by the pupil. In the beginning these movements are large, but they are gradually narrowed down to the face and lips and tongue, thus directing the attention to the movements that must be watched in the acquisition of speech and lip reading. By action work, running, hopping, falling, etc., the lip movement of the word of command is associated with the action, and the foundation of lip reading is laid before instruction in speech begins. In the teaching of sounds the aspirate precede the vocal. *p* is shown to be more than a mere closing and opening of the lips by noting the effect of the explosion of breath upon a strip of paper or feeling it on the back of the hand. *t* and *k* are similarly taught. After a number of breath consonants have been taught the open vowel *ah* is given, and contrasted with it *aw* and *oo*, the three showing a large, round opening, an upright elliptical opening and a small, round opening. Combinations of these consonants and vowels are next given, *pah*, *par*, *poor*; *ahp*, *awp*, *oop*; *pahk*, *tawk*, *kaht*. In time all the consonants and vowels are taught and combined. The written form is given as soon as the child is perfectly familiar with the spoken form, taking it readily from the lips of others and speaking it himself.

The elements as taught are placed in their proper places to form the consonant and vowel charts. These charts were originally used at the Clarke School, and are a great help in leading deaf children to become independent in the

pronunciation of new words as they meet them in their reading. They have also been used in some primary schools for hearing children, and the ability to read has been acquired much more

$\begin{matrix} o^1o \\ \text{or n-e} \\ \text{or ew} \end{matrix}$	$o^2o$	$\begin{matrix} o-e \\ \text{oa} \\ \text{ow} \end{matrix}$	$\begin{matrix} aw \\ \text{au} \\ \text{or} \end{matrix}$	$-o-$

	$\begin{matrix} \text{---k} \\ \text{---ge} \\ \text{d'ge} \end{matrix}$			

Consonant Chart. (x-ks) (qu-lwh)

Sounds in the same horizontal row have the same position of the vocal organs, and to the eye appear the same. The lip reader sees no difference between *pan*, *ban*, *man*; *pat*, *bat*, *mat*; *pad*, *bad*, *mad*. It is only by his knowledge of language and the context that he is able to know which is meant.

The Vowel chart gives the back and front

vowels in series from the narrow to the wide. Those between the two short dashes are the short sounds. The dashes represent the consonants of the words. Two vowels separated by a dash represent the diphthongal sounds. Long dashes represent words with the sounds as final. The alternative spellings have the same sounds as the chart sounds above them. Deaf children quickly learn these rules of position, and apply them in the pronunciation of any words put before them.

But all the drill that may be given on the elements and their combinations, while it may make the pupil read with a fair accuracy of pronunciation, does not impart an understanding of what is read. Any one may learn the sounds of a foreign language and read it aloud sufficiently well to convey ideas to one knowing it, and yet get nothing from it himself. Neither does an ability to read from the lips and repeat what is spoken by others mean that the deaf child has understood what was said. The normal child hears language from the day of his birth, and even before he learns to speak understands a great deal that is said to him. The deaf child, deprived of all this unconscious teaching, must be taught every word and construction as he needs to use it. This is true whether the instruction is given by manual spelling, gesture, or lip movement. It is no easier for him to understand what is meant when t-u-e-s-d-a-y is spelled on the fingers, or the thumb is placed between the fore and middle fingers and the hand waved around in a circle, than it is when the word "Tuesday" is spoken, and he watches the motion of the lips. In every case he must be taught what the signs, manual or labial, mean. It is true that the manually taught pupil can more readily imitate the signs (spelled or gestured), and so his progress at first seems to be greater than that of the orally taught, but every teacher of a primary oral class knows that her pupils are able to take from the lips scores of ideas more than they can speak. The real test of the method should be applied at the end, not the beginning of the course. On leaving school the orally taught have covered as much ground as the manually taught, and there is the added advantage that their means of communication is understood by the public at large.

The most thorough experimentation with the various methods used in the instruction of the deaf was made at the Pennsylvania Institution for the Deaf and Dumb at Philadelphia, between the years 1870 and 1909. At first, as in all the older American schools, the method was manual, instruction being given by signs, spelling and writing. Articulation was introduced first as an accomplishment for those who were thought to be able to profit by it, a few moments a day being given to the use of the vocal organs. Later classes were taught orally, but the pupils were allowed to mingle freely with the manually taught out of school.

Next an oral branch, at some distance from the main building, was established where pure oral teaching was given with an oral environment out of the schoolroom. One by one the various combinations were abandoned, until in 1892 it was decided that every new pupil should be placed under oral instruction; from that year onward the oral department steadily grew in size, and with the graduation of successive classes the manual department grew smaller and smaller, until in June, 1909, the Institution became purely oral. These experiments, carefully, slowly, and conscientiously carried out, give Dr. A. L. E. Crouter, the Superintendent, a right to speak with authority on the subject. He began the experiments with no preconceived ideas in favor of oralism; in fact, twenty years of manual teaching before he became Superintendent had, if anything, biased his mind in favor of the manual method. The oral method won on its merits. As a result of these experiments, most schools for the deaf in America now place all beginning pupils in oral classes until it is decided that they cannot profit by such instruction, when they are transferred to manual classes. Just what constitutes success is not standardized. Some claim that any speech, even very poor speech, is better than no speech, and that the friends and daily associates will understand even if it be unintelligible to a stranger. Others seem to think that unless a pupil can speak clearly and distinctly he ought not to be encouraged to use his voice.

The old manual schools did not admit pupils until they were eight or ten years of age, and in six years gave them such a knowledge of English that not a few were able to fill responsible positions. Edmund Booth was the editor of the *Anamosa* (Iowa) *Eureka*; Job Turner was a missionary-at-large of the Protestant Episcopal Church; John Carlin was a painter and poet. These are but a few of the distinguished deaf educated in the first half of the nineteenth century. Those were the days when the common schools turned out great men after a few short terms. With the increase of time in the common schools, the schools for the deaf also gave eight, ten, and even twelve years to their courses. In New York a child entering at five or six, by remaining until he is twenty-one, may have a fifteen or sixteen year course. In Great Britain the course is still short, as all children, no matter at what age they enter, are obliged to leave when reaching sixteen years. The introduction of the kindergarten in the teaching of very young hearing children has led to the establishment of several infant schools for the deaf. The promoters of these schools are of the opinion that if the deaf baby is held in the arms and talked to he will feel the chest vibrations of the mother or teacher. This, together with the lip movements which he is required to watch, forms a substitute for the sound impressions that the normal child is constantly receiving unconsciously through the ear. These

conditions often produce lip readers of the highest order, but the immature minds and uncontrolled muscles of the deaf babies do not allow them to speak any plainer than do little hearing children of the same age, and while the hearing child is guided by his ear to correct his faults of speech, the deaf child, having no such guide, becomes more and more fixed in faulty habits of articulation that no amount of after-correction can eradicate. By far better results are obtained with pupils whose instruction in speech began at six or eight years of age.

The day school for the deaf has many advocates among those who believe that the child's place is in the home and cannot bear the idea of his being parted from his parents during those impressionable years when home life means so much to him. The fact that the child is deaf, and for that reason in many cases an object of pity, often strengthens this feeling. These well-meaning people seem to forget that there are hundreds, perhaps thousands, more hearing boys and girls of the same age away from home in boarding schools than there are deaf. These come for the most part from homes of a higher class than do average deaf children, homes in which the parents and friends are better qualified to assist in their education. The theory that the parents and friends will help the deaf child in the acquisition of language is not borne out in practice, since so many either are too ignorant or have no time after a busy day's work to give such help. In the boarding school every one, from the superintendent to the humblest servant, can do something every day to further the child's progress.

With ideal home conditions of care, cleanliness, clothing, and food, all of which receive the utmost attention in the boarding school, and parents who would supplement the efforts of the teachers, as do the attendants in the boarding school, the day school might be best. But with homes as they are, the regular life of the boarding school, with its plain, wholesome food and regular hours, is to be preferred. Another feature of the boarding school that ought to be mentioned is the industrial training, by which every boy and girl is given the rudiments of a trade that they may be prepared to become wage earners when they leave school. There are sixty-four day schools in the United States, and all of them, with but one exception, are oral. Fifty of them are in three states, Wisconsin (twenty-one), Illinois (fifteen; of these twelve are in Chicago alone), and Michigan (fourteen). The day schools are usually conducted as a part of the public school system of the city or town in which they are located, but the boarding schools are mostly classed with the penal and corrective institutions and are under the state board of charities. In some states, however, laws have been passed placing the schools for the deaf under the department of education, where they rightfully belong.

According to the latest statistics (see *American Annals of the Deaf*, Jan. 1910) there were in the United States 145 schools (public and private) for the deaf with 12,332 pupils and 1,673 teachers. Of these schools 80 employed the oral method and 59 the combined method, while 8,878 pupils were taught speech and 7,562 wholly or chiefly by the oral method.

There are two professional magazines, both published in the city of Washington, the *American Annals of the Deaf*, issued under the direction of a committee of the Conference of Superintendents and Principals of American Schools for the Deaf, and the *Volta Review*, the organ of the American Association to Promote the Teaching of Speech to the Deaf. The Volta Bureau for the Increase and Diffusion of Knowledge relating to the Deaf, at Washington, was established by Dr. Alexander Graham Bell, with the Volta Prize awarded to him by the French government for his invention of the telephone. Dr. Alexander Melville Bell (1819-1905), the father of Graham Bell, also contributed liberally to the funds of the bureau. Dr. Melville Bell's Visible Speech Symbols, the most accurate method of recording phonetic values ever invented, are used in some schools for the deaf, and constitute a part of the training of every teacher.

**Canada.**—The Dominion of Canada has seven provincial schools for the deaf, of which five are combined, and two have separate oral and manual departments.

The total number of pupils (November, 1910) was 832, of whom 499 were taught speech and 399 by speech. The teachers numbered 151; 62 male, 89 female; 15 deaf, 51 oral, 52 industrial. The Canadian teachers affiliate with those of the United States and are members of both the Convention and the Association.

**Great Britain.**—A little past the middle of the last century the British schools for the deaf had abandoned the method of Braidwood in favor of the French or silent method. In 1866 the Jews' Deaf and Dumb Home was established at London by the Baroness Mayer de Rothschild. William van Praagh was the first principal, and speech was taught after the German fashion. The school was much visited, and little by little the German method was introduced into the older schools. In 1889 a Royal Commission that had been appointed to inquire into the education of the deaf recommended that all deaf children should have "full opportunity of being educated on the pure oral system"; and that the class should be spoken of as "the deaf" and not as "deaf-mutes" or "deaf and dumb," unless they were actually so. To-day the method in England is chiefly oral; in Scotland, combined; and in Ireland, sign and manual. In some schools, professedly oral, there is a movement toward the introduction of finger spelling and the establishment of silent classes for such pupils as are not successes on purely oral lines. In Glasgow and Bristol it is proposed to form

separate classes for the semi-deaf. These classes will of course be taught orally. In Great Britain the school period is fixed by law, the compulsory age being seven to sixteen, with two permissive years, from five to seven. By the cooperation of the National Association of Teachers of the Deaf and the central Board of Education the law is enforced, and in recent years the attendance has shown a marked increase. In the English schools the requirements for teachers are far more rigid than those in the United States. By the new regulations of the English Board of Education teachers in schools for the deaf will be required to hold both a Government Elementary Teachers' Certificate and a special diploma relating to work with the deaf. Teachers already employed will be retained as long as they do efficient work and satisfy His Majesty's Inspector. In Scotland and Ireland no rules are as yet laid down. The National Association of Teachers of the Deaf, of which Mr. A. J. Story is Chairman and Dr. W. H. Addison is Vice-Chairman, includes in its membership teachers of all shades of opinions. It holds a conference every two years. The Conference of 1907 was international. The organ of the Association is *The Teacher of the Deaf*, published bi-monthly. The Association seeks to influence public opinion in favor of the deaf. Trade teaching, which forms one of the important departments in the American boarding schools, is almost unknown in Great Britain, manual training and sloyd being thought sufficient. Two or three schools have, however, introduced real trade teaching. Anerley (London) led the way, and was followed by Margate. The pupils spend half the day in school and half in the workshops. Manchester has recently opened a trade school for boys over sixteen who work at their trade all day and attend evening classes. In Jan. 1910 there were 52 schools for the deaf in Great Britain with 4,653 pupils and 468 teachers. Of the schools 26 used the oral method and 14 the combined method.

**France.** — The Abbé de l'Épée died at the opening of the Revolution of 1789, and the Abbé Sicard, who had been sent from Bordeaux to study methods with a view to establishing a school in that city, was appointed his successor. In July, 1791, the Assembly converted the school into the National Institution for the Deaf and Dumb, and in 1794 it was moved to the Seminary of Saint Magloire, in Rue Saint Jacques, where it still remains. In 1859 the sexes were separated, the girls being sent to Bordeaux. Until 1879 the French schools followed the manual method of de l'Épée. In that year it was decided to introduce the oral method into the school at Bordeaux, and in the following year it was introduced at Paris. The Congress at Milan (1880) confirmed this action, and soon all the schools in the country followed the example set by the two principal national institutions. In the Paris institution boys are

taken at the age of six in a special *classe enfantine*. Their regular school course does not begin until they are nine. The school period is usually eight years, and all must leave at twenty-one. There are at present nearly two hundred seventy-five pupils. In May, 1907, there were in France sixty-five schools for the deaf, with an attendance of 3894. Four of these were national institutions, the others private. Thirty were mixed schools, with the boys and girls always in separate classes; sixteen were for boys only and nineteen for girls.

**Germany.** — Amman was the real founder of the German method. Heinicke devised no new method, he merely followed the one that Amman had practiced so successfully. Heinicke, however, deserves credit for fearlessly insisting on the teaching of speech and teaching by speech. The greatest of all German educators of the deaf was Friedrich Moritz Hill (1805-1874) of the school at Weissenfels, Prussian Saxony. The keynote of his method was the development of speech in the deaf child in the same way that nature develops it in the hearing child. While condemning conventional signs, Hill allowed the use of natural signs in the lowest classes, gradually substituting spoken language for them, the use of signs being a hindrance rather than a gain in the acquiring of speech and lip reading. In the German schools of to-day oral language and lip reading are the chief objects of instruction from the beginning of the course. The written form is added when needed. In the middle stages the work closely resembles that in the ordinary schools for the hearing, and in the upper grades it does not differ from it at all. There were in 1909 (see Radomski's *Taubstumm-Anstalten Deutschlands*, 1909), 89 schools in Germany with 7,226 pupils and 829 teachers.

In most of the countries of Continental Europe the oral method is chiefly used.

STATISTICS OF CONTINENTAL SCHOOLS<sup>1</sup>

COUNTRIES	SCHOOLS	TEACHERS	PUPILS	METHODS (Not always reported)
Austria-Hungary	38	277	2335	Mostly oral. Five combined.
Belgium . . .	12	181	1265	Oral.
Denmark . . .	5	57	348	Oral. See text.
Italy . . . .	47	234	2519	Oral. Nine report the Manual Alphabet in addition.
The Netherlands	3	74	473	Oral.
Norway . . .	5	54	309	Similar to Denmark.
Portugal . . .	2	9	64	One oral, one mixed.
Russia . . . .	31	118	1719	Twenty oral. Others mimic, manual alphabet, etc.
Spain . . . .	11	60	462	Three oral. Seven mixed.
Sweden . . .	9	121	726	Similar to Denmark.
Switzerland . .	14	84	650	Oral.

<sup>1</sup> These figures are from reports made to the Volta Bureau, 1901.

There are a few schools for the deaf in South America, South Africa, Australia, and India. In Corea, at Pyeng Yang, and in China, at Paoting, there are two schools with teachers trained under Mrs. Mills at the Pioneer School at Chefoo.

DEAF-BLIND, THE EDUCATION OF THE.

—The deaf-blind are, fortunately, a small class, and a large portion of them have been stricken late in life, so that when these, together with the feeble-minded, are deducted, there remain only a small number who can be educated. The German census for 1900 reported in a popu-

lation of 60,000,000, some 34,000 blind, 49,000 deaf, and 340 deaf-blind, that is, one deaf-blind among 145 deaf. A Swedish statistician found 90 deaf-blind among 2100 deaf whom he studied. Instances of the education of the deaf-blind are reported in America, England, Germany, France, Sweden, and Norway. Owing to the influence of the pioneer work and the fame of Dr. S. G. Howe, the largest number of recorded cases of deaf-blind who have received instruction are found in America. Mr. William Wade gives the names of about sixty in the United States and Canada deaf-blind from childhood, and the name of a deaf-blind person is not likely to be recorded unless some one has tried to teach him. Only a few names have come down of deaf-blind persons who lived before the time of Laura Bridgman, and yet there have been hundreds in the world since the work of teaching the deaf began. Among the deaf-blind in Europe and America who have been under instruction and have been most fully studied and reported upon may be mentioned Laura Bridgman, Helen Keller, Ragnhild Kaata, Marie Heurtin, Hertha Schultz. The records of the deaf-blind are to be found in a large number of reports and biographies, most of which are devoted to individual cases. There is no general work on the subject which embodies what is known at the present time of the methods of teaching the deaf-blind and the bearing of their education on psychological and pedagogical questions. Apparently some of the teachers of the deaf-blind in Europe approached the problem with little knowledge of what had been done by Dr. Howe and others. The increasing unity of knowledge in the modern world of education, and the great popular interest in the achievements of one or two of the deaf-blind, make it unlikely that in the future any teacher will begin work with a new pupil without having become familiar with the labors of other teachers; the same considerations warrant the hope that hereafter all the educable deaf-blind in civilized countries will be reported and placed under instruction.

Much of the published writing on the education and psychology of the deaf-blind is the work of those who have studied printed reports rather than the deaf-blind themselves; one cannot say that there has been too much of this kind of writing, for any expression of interest, which in turn can be the cause of interest in others, is a gain. But it should be said that no teacher, psychologist, or philosopher should draw any conclusions from the history of the deaf-blind until he has sought out several of them and talked with them. The manual alphabet can be learned in a few hours, and by means of it an intelligent person can discover for himself the general level of education which any deaf-blind person has reached. There is no excuse for so many *a priori* utterances about the capacities of the

deaf-blind as the learned have in the past sent forth with all the air of conviction and authority. And the statements of well-meaning amateurs are equally misleading, such statements, for instance, as that "none of the many successful teachers of the blind-deaf ever had any experience in the work," and that "any good teacher in our common schools, particularly in kindergarten work, is fully qualified to teach a blind-deaf pupil, after she learns the manual alphabet." There is very much more to learn than that, and there seem not to be "many" who have learned it. Much else has been written about the deaf-blind which tends to obscure the lessons that are to be learned from what has been done, and so tends to retard rather than advance the work for the deaf-blind and for the deaf. The natural generosity of the human heart makes it glad to accept exaggerated statements about the success of children who are doubly handicapped; and only by the most careful analysis of the facts and principles involved can we understand this small corner of the great world of education, a corner which holds much of encouragement and enlightenment for all teachers.

Dr. Howe quotes from Blackstone's *Commentaries* the following law: "A man is not an idiot, if he hath any glimmerings of reason so that he can tell his parents, his age, or the like matters. But a man who is born deaf, dumb, and blind is looked upon by the law as in the same state with an idiot; he being supposed incapable of any understanding, as wanting all those senses which furnish the human mind with ideas." From idiocy to Helen Keller's article on the Blind in this work (*q.v.*) what a flight of the human spirit! No department of human endeavor that is affected by the education of the mind of a child—and is there any department not affected?—can be quite as it was before Dr. Howe gave Laura Bridgman her first lessons. Laura sat beside him, her fingers on a key. Pasted on the key in raised type were the letters, k-e-y. On another slip the letters were repeated, k-e-y. She felt the key and the raised letters on the two slips, perceived the similarity, and inevitably, after many trials, there was formed in her mind an association between the two sets of touch sensations, the shape of the letters and the shape of the thing. The association was precisely the same that forms in the mind of the normal child between the sensation of touching and seeing the key and hearing at the same time the word "key." In many lessons there were formed in Laura Bridgman's mind associations between other groups of raised letters and corresponding objects. The first important change in the physical means of instruction was the substitution of the manual alphabet commonly in use among the deaf in place of the printed labels. Here again, the work of the teacher

was to present to Laura an object, ball, book, or mug, and at the same time to form the manual letters that spelled the name of the objects with the pupil's hand upon the teacher's. These manual letters did not, be it understood, enter the child's consciousness *qua* letters, but as movements of the hand; the same movements were invariably associated with the same objects, each collocation of the finger motions repeatedly for many weeks and months accompanying its object until the association was firmly made, and until the child grew to expect that any newly encountered object or act should have its appropriate finger word. The means of educating the deaf-blind had been found.

The next important step forward was made in the first lesson given to Oliver Caswell by Mrs. Mary Swift Lamson. An account of this lesson is to be found in an appendix of Mrs. Lamson's *Life of Laura Bridgman*. She began immediately with the manual alphabet, and in half an hour she gave Oliver Caswell the notion that all things have names,—a conception that it had taken Laura Bridgman nearly three months to arrive at. That appendix may be regarded as the most advanced statement of method that had been written at that date, 1879. In the following criticisms personal credit is of little importance; the intention is to explain what happened in one case and another, for the guidance of future teachers. With this end in view much of what follows has been thrown into the form of injunctions and criticisms addressed to an imaginary teacher at work with a deaf-blind child.

Before following the development of the method of applying the manual alphabet in teaching the deaf-blind, it should be recorded that in the education of Ragnhild Kaata, begun in Norway in 1888 by Mr. Elias Hofgaard, the manual alphabet was not used; the first lessons were given by placing the hand of the pupil on the lips of the instructor. In this case the principle of association between certain movements of the organs of speech and the object represented by those movements was precisely the same as between manual spelling and the object, or, in the case of the normal child, between the object and the sound of the spoken word striking the ear. The difference between Mr. Hofgaard's work and that of most other teachers of the deaf-blind is one of instrument, not of principle. The manual alphabet is a preferable instrument, requiring less strain on the part of the pupil, the large letters formed by the hand being more boldly differentiated than the finer movements of the lips. Some of the deaf-blind can learn to speak and read the lips, but this acquirement should follow the acquirement of language.

With the deaf-blind, as with the deaf, the main problem is the teaching of language. Whoever has command of a living language is

educated. Other knowledge follows language or is implicit in it. Deafness and blindness dam up two streams of stimuli from a world of objects, but — worse loss to the brain — deafness closes the channels of speech, speech that carries to the normal child the very stuff of education. Through the fingers of the deaf-blind it is possible to direct two vehicles of language, the manual word and the printed word. This printed word will be the embossed type used by the blind, and it should be taught as soon as possible after the manual word has given the pupil his first clues to language. The skillful teacher can combine manual conversation with the game of hunting words on the embossed page, and, by exciting the curiosity of the pupil, coax him to follow a story in print. Formal reading lessons should be guarded against, lest the child conceive a distaste for his book. If a dog out in the yard has interested the child, it will not require great cleverness on the part of the teacher to trace the dog into the pages of a book and keep the child in excited pursuit. Reading is of the utmost importance in supplying new words and new interests.

The essential mind of the deaf-blind child is not different from the normal; it has the same instincts and impulses, the same desires communicated from an appetitive body, and the same power to invent, imagine, recombine, and reflect on what it receives. The study of the mind hedged in by defective senses is a subject which the psychologists should systematize; a good book on the subject would be of utmost value to the teacher. Not enough emphasis has been put on the sense of touch, which is the great sense. The whole skin sees and listens, and not only the skin, but the entire body, bones and muscles. Psychologically, and as a matter of biological history, hearing and sight are only specializations of the sense of touch, and as the parent of these senses it has many capacities which in normal people have been appropriated by the finer offspring; these capacities are still available in the redemption of the mind of the deaf-blind from idiocy. Through them by tactual experience of the outer world, combined with a language which is instinct with the wisdom of the race, the twice-buried mind can know the sun, the sea, and the stars.

The task with the deaf-blind child is to cultivate the sense of touch so that it shall convey the greatest possible variety of experience, to keep the child in a state of constantly interested action, and to pour into the mind in its interested and aroused moments a stream of language. The chief limitation of touch is its slowness in doing some of the work normally done by the ear and eye. It takes longer to flood the deaf-blind child with words than for an equal number of words to reach the mind of the normal child as they fall from the lips of his parents and companions. The records

of Laura Bridgman show that her lessons occupied but three or four hours a day. This is not enough. The early lessons are not school-room exercises analogous to what the normal child is subjected to when he first goes to kindergarten; they are analogous to what the normal child receives before he goes to school at all. They should be play, and they should go on all the time that the child is awake and active. The teacher must put away grown-up things, and become the playmate of the pupil, taking the place of the normal child's associates who use spoken words. And all the family and friends of the deaf-blind child should learn the manual alphabet, and use it on every possible occasion. Language study should at the beginning be pleasant; the child should not think of it as a task. To teach language, or anything else, the teacher must have the interest of her pupil. One cannot expect to hold the attention of a little child very long on one thing. The hearing child learns language while he is attending to something else, his dog, his food, his toys. When the deaf-blind child begins to fidget, he is for the moment past learning. The bugbear, discipline, should be banished, until the child has some language, some moral sense to appeal to. Certain kinds of discipline must be enforced, as with an animal, but that is a different matter from discipline in relation to language lessons. I have seen little deaf children bored to death with exercises which they were required to write over and over again until the lesson was "perfectly" learned. That sort of teaching is worse than wasted. It inspires in the child a distaste for knowledge. Even a child has a right to resent being bored. The advantage of novelty outweighs the benefit secured by "sticking" to a task.

The need of spontaneous interest on the part of the deaf-blind child — and the normal child, too, — cannot be too strongly insisted on. In the case of adult pupils, and to some extent in the case of young normal pupils, discipline and duty can be summoned to force attention to a dull teacher. In the case of a deaf-blind child, there is no moral sense to count on. The moral sense is an adult acquirement that follows a knowledge of language. It is almost pathetic to read in the records of Laura Bridgman and Marie Heurtin of the premature efforts of the teachers to discover or develop a moral sense and a religious faith in minds that had hardly enough vocabulary to make known simple material facts and desires. Our views of morality and deity are no more comprehensible than astronomy to a deaf-blind child who has not yet got hold of a simple vocabulary and the common facts of life about him. In the first stages it is his meanings, his desires, that we are seeking to open and clarify.

When a deaf child interrupts a lesson with something he is eager to tell, the teacher should try to get at his intention, and, by throwing

in a word here and there, to help him to self-expression. Do not stop the flow of his narrative with "You must say 'I,' not 'me.'" Simply help him to say his thought, and so build his language. Grammar is of importance only to grammarians, and the difference between a preposition and an adjective is of no consequence to the child. The differences exist in what he is doing, but he cannot be conscious of them. So that all discussion of "how to teach adjectives" and "how to teach verbs" is wasted breath. The child learns nouns first, because they name his crudest tactile experiences, but he learns all parts of speech in precisely the same way, because they express things and relations of which he is conscious at the moment when the words and series of words are spelled into his hand. One reason that deaf children do not learn language better is that they are not allowed to use imperfect language freely. The instinct to use language for the purpose for which it exists—to communicate—is checked by the zeal of the teacher to improve grammar or idiom. Lead the child's idioms, but do not correct them. If the teacher uses correct and abundant language, the deaf child will use correct language in time by imitation. A normal child brought up in a cultivated intelligent family and sheltered from corrupting influences could not, if he tried, use very bad English—unless he were clever enough to invent it. If a deaf child is "corrected" in the act of expression, the interesting fact which he wishes to communicate is forgotten. He is discouraged when he finds so many difficulties, and he resorts to signs or pantomime. Let the teacher tax her wits to get the meaning from his stumbling words, and not block him in his impulse to use words. Some day she may be able to revert to the incident which he has imperfectly explained, and make a "language lesson" of it. But while the child's interest is hot upon his narrative, of the cow he has seen or of how he cut his finger, any word of the teacher which distracts him is to be deplored. His words should stand for living thoughts, not our thoughts, not book thoughts, but his thoughts. The prattle of the normal infant is spontaneous; and how imperious is the desire to express thoughts, how really varied a child's thoughts are! Imagine the effect if a zealous parent were ever at the elbow of the normal child insisting that the little one use only correct sentences fashioned according to adult Olympian standards. It is hard to kill the instinct to talk, but it can be done—in schools for the deaf—by making language work an abstraction detached from life and growth, to be laid aside the moment the pupil is let out of the classroom, and so inevitably associated in his feelings with strain of mind and body.

In trying to convey an idea to a deaf-blind child it is often sufficient to place contrasting

ideas in juxtaposition, to put a small object beside a large one, a soft substance beside a hard one. In this way "adjectives" are learned without difficulty. In the same way abstract ideas are grasped and remembered, if the teacher seizes the right moment. Some day she will find her pupil in a temper. Ask him quickly why he is angry. Imitate his behavior. Show him his sister playing with her doll. She is not angry; she is good and happy. He knows his own state of mind as well as anybody knows it, and he will learn the words that express it. The child's own sensations and emotions supply all the explanation that is necessary. The words spelled in the manual alphabet, the twist of fingers, will become associated with the thing, with the fact; he does not know, and does not need to know, that the manual word is a combination of letters, any more than the normal three-year-old knows that the sound "mad" is a word, an "adjective" of three letters.

Bright, deaf-blind children, before they are taught, acquire many signs by means of which they often vainly strive to express their obscure but varied sensations. Before the time when language becomes second nature, they are made restless by thwarted efforts to communicate. This shows that the will to speak is in the nature of the human being. But the instrument of speech, the civilized language, is a slow growth, an artificial instrument, the use of which must be acquired, and acquired properly, like the art of playing the violin. Dr. Alexander Graham Bell says of Helen Keller's "wonderful familiarity with idiomatic English": "She is such an exceptional child that we are apt to attribute everything to her marvelous mind, and forget that language comes from without, and not from within. She could not intuitively arrive at a knowledge of idiomatic English expressions. It is absolutely certain that such expressions must have been *taught to her* before she could use them." Granting all varieties of capacity in human minds, there must be indispensable right ways to teach language to the poorest intelligence, and ruinously wrong ways to teach language to the finest intelligence. The individual in learning language comes in contact with a highly elaborate instrument that has grown up with the race and has been refined and amplified by the great artists and thinkers who have used it. To be initiated into the use of it the individual must come in contact first with the parts of it that express his sensations and experiences; and so he proceeds through language itself, from the little of it that expresses him into its riches that express very much more than the individual; thus he becomes "educated." Without the personal contact between his impulses to utter and the borders of the great language he will never learn it, though its entire vocabulary be dumped into his memory. Deaf persons through

patience and industry have been able to amass a truly wonderful vocabulary. They could spell correctly, write legibly, make neat sentences in which every word was correctly used. Yet when they tried to say or write their own ideas, they fell into "mutisms," and showed that they did not in any true sense know language. So long as words are known only as words, they do not constitute language. If one knew the dictionary from A to Z, one might still be unable to merge a hundred words into intelligent, idiomatic, adult discourse. Language by itself is dead. It must grow in relation to life. Teaching language to a deaf-blind child, or to a normal child, should consist in catching the vital impulse to utter, whenever it shows itself, and supplying the means of utterance. Unique unforeseen opportunities start from every chance observation that the pupil makes of his surroundings. He will meditate upon two similar experiences and try to find the way to express the combination. The mind has a sense of relations, of joints and connections, and it is in obedience to this sense that our language has "parts of speech," words that express relation. The deaf-blind child perceives sweetness as well as a normal child. If, simultaneously with his experience of the sensations, there are spelled into his hand "sweet apple," "sour apple," "sweet sugar," "sour lemon," "bitter quinine," he will not, as has been thought, mistake sweet apple for a compound word — and it will do no harm if he does! His mind will in time sort out the words that go with his experiences. Joy, sorrow, love, hate, surprise, and disappointment are just as cognizable by a deaf-blind child as by a normal child. But if a young deaf-blind child, or a normal child, never has experienced surprise and does not know the names of enough other emotions to explain it by, "language lessons" will never teach him the word "surprise." The transition from physical to intellectual things and qualities is easy; it is certainly no more mysterious in the deaf-blind than in those who see and hear. When a deaf-blind child knits his brow over a perplexity, and the teacher taps his forehead and spells "think," the child knows how it feels to think; he understands, therefore, as much of the content of that great word as he needs at the moment. He has nibbled the edge of the word; in time he will swallow it all, with its enormous suggestion, and so come to understand what "a great thinker" is. It may bother us to understand how he learns an abstract quality, but it does not bother him; he merely recognizes a fact and gets the name of it. One word learned in the right way stimulates the mind and makes it eager for another. Once the child has asked out of his own head, "What is it?" the main difficulty is past; the face lights with pleasure. (See the account of Oliver Caswell's first lesson in the *Life of*

*Laura Bridgman* by Mary Swift Lamson, and the account of how Helen Keller learned "water" in the supplement to her *Story of my Life*.)

The teacher has much to think about in order to avoid wrong methods of teaching, but needs only a little ingenuity to find abundance of lessons that almost teach themselves. A startling incident can be discovered from its context in a book and described with enthusiasm, such as a dog biting a cat or a horse running away, something "sensational" that a child likes to talk about. The detached episode will often assure the attentive reading of the whole story, and many words are absorbed in the process. The child likes to talk about himself. He is the hero of the drama, and his egotism is a very important stimulant. A story about the day's events, which he knows as well as the teacher, makes a first-rate language lesson. Put in incidents that did not occur, and see how eagerly he will set you right. A chase after a butterfly — the best schoolroom is out-of-doors — contains a volume of language lesson. The curiosity must be continuously aroused, for blindness and deafness shut out many of the interesting accidents that accost the senses of the normal child. The why? what? whither? when? must be stirred by surprises and invented episodes. Some confusions, not very damaging if they occur, may be avoided. Abstract words are often blurred because they are taught together. Laura Bridgman could not dissociate "punish" from "blame," because the right moment was probably not chosen for teaching the words; they were given to her together in connection with one "naughtiness." It is a mistake in the early stages to try to illustrate one abstraction by another. It is better to use contrasting experiences, that each may remain clear and distinct with its vocabulary. But life itself will teach the teacher, if she is apt to learn, and if she understands thoroughly the fundamental nature of the thing she is trying to do, interfuse a language with the life of the child.

After the deaf-blind child has acquired sufficient language for working purposes, the process of teaching articulation may be begun. The method is much like that of teaching speech to a deaf child who sees. The deaf child watches the teacher's lips and imitates. The deaf-blind child puts his fingers on the teacher's organs of speech, and imitates their position. This is a very important and useful acquirement, and if a deaf-blind child cannot be interested in the process, cannot be taught a crude articulation, this would seem to indicate that the child has not thoroughly learned language by means of the manual alphabet. Spoken language is for the deaf-blind child a means of speaking to his friends and family; less cumbersome than the manual alphabet, and the process of learning it gives the child a

living sense of the faces and expressions of normal human beings, and so enables him by imitation to put expression into his own countenance. It is another bond of contact with normal life. A natural voice has not yet been developed in any deaf or deaf-blind person, but it might be done if the physiology of the voice were studied as a good teacher of singing understands it, and if this knowledge were combined with knowledge of teaching the deaf.

**DEAFNESS.**—The inability to hear normally. Deafness may be of any degree, from the stage exhibited by the individual who is "hard of hearing" up to complete deafness, which latter is usually due to deterioration in the inner ear or the auditory nerve. If the defect is due to disease in the outer ear, the sound vibrations may be conducted to the inner sensitive organs through the bones of the skull. There are various defects of special types which do not involve actual loss of hearing, but are nevertheless called deafness. Tone deafness (often classed erroneously as mental deafness) is the inability to appreciate the pitch of tones. It is probably due to peripheral defect (in the basilar membrane). In some cases there are gaps in the tonal scale while the rest of the scale is normally received. Mental deafness is the inability to interpret auditory impressions because of defects in the central nervous organs.

**DEAFNESS IN SCHOOL CHILDREN.**—See EAR, HYGIENE OF.

**DEATH RATE OF SCHOOL CHILDREN.**—See MORTALITY AMONG SCHOOL CHILDREN.

**DEBATING IN SCHOOLS.**—Debating, or more technically disputation, was the distinctively oral method of mental discipline in an age before the introduction of the printed book. In the Middle Ages (*q.v.*), preparation in theology, law, medicine was carried on in Latin by means of systematic disputations conducted in the presence of seniors who had won their reputation by disputational skill. Dialectic or logic was thus the chief of the seven liberal arts (*q.v.*) before the Renaissance, as rhetoric was the chief art exercised after that period. The dialectic disputation concerned itself with the subject matter of grammar in the early stages, with that of theology, law, medicine, in the later stages, and throughout all studies medievalism displayed the greatest ingenuity in bringing all the details and combinations of details of these subjects into the metaphysical arena, in all cases reducing the point in dispute finally to a principle founded or supposed to be founded on Aristotle (*q.v.*). The disputational method therefore was based on authority, and in its exercise reacted so as to intensify the need for final authority. When the Renaissance opened up vast vistas of knowledge requiring inquiry with an open mind, authoritative Aristotelianism was doomed, and the introduction of other methods more suited for inquiry became more urgent; but even in the universities the method of the disputation persisted as the recognized test for higher degrees and the maintenance of a thesis, now usually a written exercise, and *viva-voce* examinations are present-day survivals. Valuable as the disputation was as a mental discipline in ages when there were no texts, no books of reference, information, and criticism, it led to great abuses. Vives (*q.v.*) in his *De Disciplinis* (1531) says of young students: "One disputation a day does not suffice, nor two, as with eating. At breakfast they wrangle, at supper they wrangle, after supper they wrangle. In the house they wrangle; out of doors they wrangle. . . . In every place, at every time, they are wrangling."

The disputation was a school as well as a university method. In the twelfth century, Wm. Fitzstephen gives an account of London schoolboys from different schools assembling on holy days "about the church" to "dispute." "Some use demonstrations, others topical and probable arguments; some practice enthymemes, others are better at perfect syllogisms; some strive like adversaries, others for truth." In 1518 Dean Colet in his statutes for St. Paul's School forbade his school to join in the disputation at St. Bartholomew's. But after the Reformation, disputational power in holding their own in the religious controversies was greatly valued, and both Roman Catholics and Protestants were inflamed with zeal to train their disciples to skill in the disputational method. The Jesuits (*q.v.*) in their schools carried the method to high development, and the English universities, in the time of Elizabeth and later,

tightened their hold on the disputational method in view of the religious controversies. The grammar schools (*q.v.*) followed suit; but the subject matter in the latter was chiefly grammar, a subject which had undergone enormous development after the Renaissance, being closely connected with the reading of the new world of classical authors, which had come within the ken of the students. The chief textbook on grammatical disputations was by John Stockwood, head master of Tonbridge grammar school, entitled: *Disputatiuncularum Grammaticalium libellus, ad puerorum in Scholis trivialibus exacuenda ingenia primum excogitatus*, 1598. Between 1598 and 1650 this book in Latin passed through six editions. Stockwood's argument is that, grammar being the main business of the school course, pupils have already in their knowledge the materials out of which they can best be expected to form opinions and judgments by arguing upon them. In 1612 John Brinsley (*q.v.*) in his *Ludus Literarius* devoted Chapter XVII to grammatical appositions, showing "how to dispute scholar-like of any grammar question in good Latin." He strongly recommends Stockwood's book, and advises that the pupils observe "as much as may be, Mr. Stockwood's phrase, his order and witty conceits, which he useth both in objecting and answering." Charles Hoole (*q.v.*) in the *New Discovery of the Old Art of Teaching School* (1660) introduces the method of dividing a form into two "sides" (showing the influence of the Jesuit method). "Let every one propound to his opposite two or three questions which he thinks most difficult out of his week's work, which if the other cannot answer readily before he count six or ten, in Latin, let him be *captus*, and the questions be propounded to his next fellow. The lowest in the form may begin the dispute, and so go on to the highest on either side, who should keep reckoning of those that are capt and how often." Hoole has a similar system for "capping" Latin and Greek verse.

Thus the method of disputations developed out of the method of "appositions," that is, setting of questions orally by one boy to another in a class, or of the master to various boys in a class, as an oral text or examination of work done. This was commonly done on Fridays as a résumé of the week's work. It provided an opportunity for the discussion of any difficulties which required clearing up or emphasis. The method of apposition spread from the grammar school into the elementary or "petty schools" as we see in Coote's *English Schoolmaster*, the most extensively circulated elementary textbook up to 1660. F. W.

**In America.** — The necessity for possessing a speaking knowledge of Latin was no longer felt even in the colonial period (*q.v.*), and the chief means for perpetuating disputation as a prominent educational method was for the facility which it gave in public speaking and the logical training in argumentation, chiefly in theological

discussion or presentation. Hence there was little or no need of perpetuating disputation in the Latin grammar schools, and little evidence exists that it formed any part of this training. In the colleges it was different, and disputation formed a prominent part of college work, both throughout the year and especially in the commencement exercises (*q.v.*). In the *Proceedings of the Massachusetts Historical Society*, for 1800-1881 (Vol. 18), there appears a long list of several hundred subjects of disputation given by Harvard students from 1655 to 1790. These relate to the greatest variety of subjects, including political, social, philosophical, scientific, medical, legal, ethical, scriptural, ecclesiastical, and theological. While many of these reveal a medieval attitude of mind in their statement, many on the contrary are quite modern. "Are polished manners an ornament to a man?" was discussed several times, beginning as early as 1727, a generation before the writings of Rousseau and Chesterfield. The same year saw the discussion, "Is unlimited obedience to rulers taught by Christ and his apostles?" and five years later, "Is the voice of the people, the voice of God?" In 1781 "Is the diffusion of knowledge among all citizens necessary to the existence of the Republic?" was one among many political and social questions propounded. "Can independent beings be created by God?" "Are intelligences composed of matter?" "Does a shadow move?" "Is there a stone that makes gold?" "Was there a rainbow before the deluge?" "Ought physicians to pray for the health of people?" "Is there a nervous fluid?" are samples of these questions in a variety of fields.

During the latter eighteenth century and the early nineteenth, the rise of national interests, the development of patriotic fervor, the increased influence of the legal profession, the opportunity for power to be acquired by the popular orator, put a new value on debating and changed its character. It now ceases to have any connection with the study of the Latin language, takes a new and larger place in the work of both school and college, and comes to be recognized as a distinct branch of study or educational activity in both. Even the elementary school now attempts to prepare for exercises in disputation by the training in declamation (*q.v.*). This prominence of debating as a practical preparation for public leadership, though directed toward the development of self-confidence on the part of the pupil rather than of a command of better English, continued until after the Civil War period. Subsequent generations of schoolmen have come to give debating a place in school activities chiefly as a part of the training in English and only secondarily as a direct apprenticeship to public activity, chiefly of a political or professional character. P. M.

**Debating in schools at present.** — There is now, however, a well-marked tendency among

American colleges to establish departments and chairs of public speaking entirely separate from the department of English. One of the foremost subjects of study taught by these departments is debating. A debate is an oral contest in which one contestant tries to convince an audience of the truth of a definite proposition while the other tries to demonstrate its falsity. An opinion upon some topic is stated in the form of a proposition, and sides are chosen, one to uphold the affirmative and the other the negative. Both sides are allowed the same amount of time to present their respective cases, and equal additional periods, in which to criticize or rebut the opposing contentions. A decision is usually rendered in favor of the more convincing arguer. Although debating is taken up even in the secondary schools, both as a part of the curriculum and as an extra student activity, still it is more properly a college subject. At college it is regarded as the most important part of the general training in public speaking. Its pedagogical value lies in the fact that it is a powerful agent in adjusting the student to his environment. The subjects for modern debate deal with current political, social, economic, and moral problems. Such resolutions as: Resolved, that the United States relinquish control over the Philippine Islands; Resolved, that direct nominations be established in New York State; Resolved, that there should be a physical evaluation of railroads engaged in interstate commerce; and Resolved, that immigration be further restricted by an educational qualification, force the debater to study the world about him and become well acquainted with it. Furthermore, the questions are so worded that they are capable of practical demonstration; their settlement depends upon a careful and wide observation of concrete facts, and not upon the working of a brilliant imagination or the manipulation of abstract, logical formulæ. (See the list of subjects given above, debated at Harvard over a century ago, for a contrast.) Dialectic agility and a store of authoritative opinions no longer win debates; a knowledge of verifiable facts and clear inferences from those facts are essential to victory. But besides being trained to carefully search out trustworthy facts as the basis of all his opinions, the student is taught how to arrange and present all his evidence in spoken form so as to convince others. The habits of careful judgment and precise expression cultivated by practice in debate are invaluable to any man, whether he becomes a public speaker or not.

As a part of a general course in public speaking, which has for its ideal the training of the student to most adequately express his thoughts on any subject in an extemporaneous manner, the debate is most effective, for the following reasons. First, the student has a definite topic upon which to speak; second, he has a limited field for investigation, and he is forced to seek good reasons for what he says within that field;

third, the logical sequence of treatment helps him acquire the power of formulating an address without the help of notes or memorizing; fourth, the contest stimulates his interest. Probably no subject in the entire college curriculum does more to correlate a student's knowledge in all branches, to stimulate his mental activity, to bring him in closer touch with his environment, and to make him more capable of reacting beneficially in that environment, than debating. E. P.

**DECLAMATION IN THE SCHOOLS.**—

**England.**—The grammar school of the sixteenth and seventeenth centuries did not achieve its full purpose on the secular side unless it not only brought the pupil to a wide reading of the classics, and to a power of writing written Latin, but also developed fluency of Latin speaking. The declamation, therefore, originally implied the pronouncing distinctly, and with elocutionary effect, the composition which the pupil had prepared on a given subject. Declamation was thus closely connected with the theme. Charles Hoole (*q.v.*) says (1660): "After you have shown the boys (of the form) how to find subject-matter and where to help themselves with words and phrases, in what order they are to dispose the parts and what formulas

they are to use on passing from one to another; pronounce a theme to them in English and Latin, and let them strive who can soonest return you the best *Exordium* in English, and then you can render it into the best Latin, and so you may proceed to the Narration, and quite through every part of a Theme, not tying them to the work of any author, but giving them liberty to contract or enlarge or alter them as they please." This they are to bring as a written exercise, and to be able to pronounce it distinctly memoriter at an appointed time.

After a study of passages from classical oratorical writings by the competition of boy against boy, exercises were thus brought to "the best," and also delivered orally in the most elocutionary style. Hoole states that this method made his boys "like so many nightingales to contend who could *μάλιστα Λυγίως*, most melodiously, tune his voice and form his style to pronounce and imitate classical orations." No day in the week was to pass on which some declamation, oration, or theme should not be pronounced by some boy in the sixth form. Schools which could not proceed to such effective results in the compositions of the boys themselves were contented to have their declamations from passages selected for the purpose from the classical authors. But in all cases, the intention originally was to practice the pupils in correct and fluent pronunciation of the classical languages, to improve the control of the knowledge of those languages for speaking purposes. The declamation was sufficiently important to find a place in school statutes and orders as a prescribed method. Thus the orders of Guildford grammar school, 1608, require that boys should declaim on grammatical or rhetorical questions on half holidays or Saints' Days. In Archbishop Laud's (1621-1628) transcript of the old orders of Westminster School declamations in Greek and Latin were prescribed for Saturdays. At Newport grammar school (Salop) (1656) the statutes ordain declamations once in six weeks, or in two months at the furthest on Saturday forenoon. So, too, at Wigan in 1664. An interesting practice prevailed in the Charterhouse and some other schools of sending the boys, on special occasions, to hear the exercises of the boys in famous schools such as Westminster or Merchant Taylors' School.

When the French influence came into England from 1660 onward, and French gradually took the place of Latin as the international spoken language, the declamation of the classics became less and less a regular daily or even weekly exercise, and the learning of so many Latin or Greek lines by heart to be recited in class was substituted. Still the declamation was retained for special occasions of the school, such as prize distributions, when the scholars recited before the governors, parents, and visitors chosen passages from the Latin and Greek authors, but intermixed with passages from the vernac-

ular authors and authors who had written in the modern languages. This practice is continued in English Grammar Schools, and such occasions are still described as "Declamation Days."

P. W.

**United States.** — In American schools the late eighteenth century and the early nineteenth gave renewed emphasis to the importance of declamation through the increased opportunity for the public oration and the numerous occasions for display of oratorical power. The textbooks in reading and literature, as well as even those in spelling and grammar, became filled with selections suitable for declamation. This replacing of the old reading materials, chiefly of a religious character, by those of a political, social, or dramatic character, had great influence on the interests and the character of the people. Reading and such literary studies as found a place in the schools came to be used chiefly to develop this power of public presentation, rather than to develop literary appreciation, or power to use the English language effectively in conversation, speech, or composition. It was customary, in most schools, to set aside one afternoon a week, or at least one afternoon a month, for a general assembly to be devoted entirely to declamation. These exercises seem to have had a marked effect upon the public speaking of the period, but an effect that hardly meets with modern approval. In general the selections were beyond the comprehension of the pupils or of but little interest to them. They were usually martial verses on the order of *Bernardo del Carpio* and *Horatius at the Bridge*, or the fervid perorations of an impassioned oration, such as Patrick Henry's *Appeal to Arms*. Furthermore, these declamations were mechanically delivered in imitation of the pattern set by the teacher, and unlucky was the pupil who misplaced a gesture or failed to inflect his voice in the exact manner which his model indicated. The style developed, not only in the pupils, but in adult speakers, was bombastic and flamboyant — the style that even now appeals to the untutored as the very acme of oratorical perfection. When we hear it said that oratory or declamation is now on the decline, we must surmise that the reference is to this kind of oratory — the spread-eagle, star-reaching pyrotechnics of our forefathers.

But declamation and oratory in the truest sense are not declining, but rather developing; more refined standards are replacing the coarse ones of half a century ago, and sounder pedagogical principles are followed in the use of declamations in the schools and in the methods employed in teaching them. In the primary grades, more time is given to English than to any other subject, and also the child's power of free, oral expression is developed as the foundation for all effective work in reading and composition. In company with conversation lessons, language instruction, reproduction of stories, and dramatization, the memory or pri-

mary declamation helps to develop this general power of effective oral delivery. The subject matter of these memory selections (see *New York City Course of Study*) are within the child's comprehension, are of interest to him in their subject matter, and have a distinct literary excellence calculated to develop taste. The purpose of classroom and assembly recitation of these selections is not only to secure confidence before an audience, but to give a power of literary appreciation and a consequent ability to render the thoughts of the author in a sympathetic manner. The teacher also makes use of the declamations as a basis for the correction of defects in pronunciation and articulation. As a rule, very little is done in the matter of voice training and technical elocution. In teaching these selections, the methods generally adopted are calculated to increase the child's knowledge of words, impress him with a love for the beautiful in literary composition, and develop his general power of correct and pleasing oral expression, rather than to prepare him definitely for public speaking. But as the work progresses, this function of the declamation as a training in general language excellence gives way to a more distinctly oratorical or elocutionary purpose. The declamation is used more and more as a convenient means of having a pupil speak in public at a time when he cannot be expected to say something original.

It is in the secondary schools that the separation of elocution from the general training in English becomes clearly noticeable. In many city high schools and private academies the work of elocution is in the hands of a specialist, and is not regarded as a by-product of the department of English language and literature. The differences between the structure of matter meant to be spoken and that designed to be read are pointed out, and the pupil is trained to have a definite attitude toward the audience. In the treatment of declamation, the method is distinctly modern. Whereas a few decades ago the pupil was carefully coached to imitate his master's way of rendering a selection, the plan now is to stimulate rather the pupil's self-activity and to expect a spontaneous rendition of the declamation, prompted by the pupil's own thoughts and feelings. It is customary for the pupil to analyze the piece carefully for its meaning and to give the teacher either an oral or written paraphrase as evidence of the thought he gets from the author. The teacher guides, suggests, and keeps up the interest, but seldom recites any passage, for he is seeking not to impose his own personality and mode of expression upon the pupil, but to bring out a sympathetic rendition of an intelligent, first-hand interpretation. The pupil is made to realize that he must faithfully represent to an audience, by his voice and gestures, the thoughts of another. He owes a duty to the author and to his hearers. The selection is a living message to be conveyed to others, not a "piece" to be

memorized and mechanically ground out in close imitation of the teacher. During the practice with declamations, instruction is usually given in the elementary principles of elocution, orthoepy, and voice management; and practical efforts are made to correct defects of delivery ranging all the way from stammering and stuttering, through nasality and dialect, to mere localism and mispronunciation. In some schools where debate (*q.v.*) and extemporaneous speaking are taken up, the declamation is regarded as a preparation for these more original forms of public speaking.

In college the declamation is used either in the lower classes as a preparation for the public speaking proper that is taken up in the higher grades, or it is developed independently to a marked degree along lines of advanced elocution. When used as a preliminary step in the general course in public speaking, the method of instruction is similar to that just described for the high school, save that the standard is higher. More attention is paid to the "straight speech" than to any other kind of selection, and the student is especially stimulated to acquire the speaker's attitude. When declamation is practiced as an end in itself, that is, for the purpose of training the student to become an interpretative public reader, the range of selections is widened and more systematically studied, while greater care is taken with the minutiae of vocal technique. This, however, is the beginning of special, professional training.

E. P.

See DEBATING (References).

**DECORATION OF SCHOOLS.** — One common fault in the decoration of schoolrooms is over-decoration. A large number of charts, drawings, or illustrative material displayed at one time is not only distasteful and confusing, but introduces a distraction directly opposed to that sense of fitness and quiet beauty essential in genuine æsthetic appreciation. The first principle to be observed, then, is the following. A few good pictures or other objects of artistic excellence properly and appropriately placed exert a stronger and a more satisfying influence than a large number, even though when taken separately no objection could be found to any single piece. It is more than difficult to create and preserve a sense of artistic unity where many objects are presented to the senses, even though a similarity is distinctly noticeable. A few masterpieces teach effectively, while a great number distract; if great variety is presented, the multiplicity will effectively nullify any possible unity of thought or feeling. The second principle to consider carefully may be stated thus: The artistic decoration of schoolrooms should be planned with a full appreciation of the feelings and the power of emotional understanding of the children who are to occupy them. Here as in intellectual matters it is easy for adults to believe that what seems best to

them will be most helpful to the children. True beauty and genuine art may be simply and plainly set forth, or hidden and only suggested. Children appreciate the former; thoughtful and discriminating minds much prefer and more keenly relish the latter. A child will appreciate and understand the "Melon Eaters" of Murillo, and get little or nothing from any one of his "Annunciations." A boy of the fourth or fifth grade will feel the spirit of "Sir Galahad," and get far more from it than from a "St. Anthony of Padua with the Holy Child." The emotional life of children demands wholesome and worthy stimuli, but also those which represent situations within their power to appreciate. To this end, it requires wise and judicious teachers, those who know what children can make use of as well as what they ought to have, to select pictures, and guide in all matters relating to schoolroom decoration.

In addition to the use of photographs, drawings, and statuary, it is to be hoped that the artists of our country will soon come to realize that public school buildings offer an unusual opportunity for mural painting both for the sake of decoration and that higher educational influence which comes from allegorical and historical representations. In this respect we are woefully behind many other countries. But surely it is neither because of lack of material, nor because of our ability to pay for such work that makes us neglectful in this part of our educational duty. There is a need of more artists and a more general appreciation of what art means to a nation. Here, then, where children live, and where the enthusiasms of life are awakened, is the best place to begin. Assembly rooms, well-lighted halls, and those special rooms set apart for drawing and art work in general ought to appeal particularly to those artists who know what our children need, and what our people ought to have. But there is yet a great deal to be done in the way of sincerity and honesty in the mere construction, furnishing, and finishing of our school buildings. Most architects are still satisfied with the merely usable, and these give little time or thought to exaltation of the common things by a touch of beauty. Our country is in great need of that ennobling impulse which seeks to make necessary things beautiful and satisfying. School desks, tables, chairs, and all other furnishings, even though inexpensive, deserve artistic treatment. In addition to the positive treatment of schoolrooms, the teacher can help very much by the skillful display of maps when needed, and their immediate removal when not needed. The location of desks, tables, bookshelves, and reference books deserves careful consideration. Blackboards are hard to keep clean in the upper grades of schools, but if shades, which will harmonize with the walls, are so placed that they can be drawn over the work until the board is further needed, a good deal of relief can be obtained. It is a safe procedure in any com-

munity to select a committee of the most helpful teachers to submit plans for schoolroom decoration, for the principles of art and the capabilities and needs of the children are both at stake. It is then the duty of the supervisory officers to adopt, supply, and above all to keep an eye out for general fitness in all things. F. B. D.

For references and further discussion see the various articles on ART and ARCHITECTURE, SCHOOL.

**DECUSSION.** — See NERVOUS SYSTEM.

**DEDUCTION.** — The process of reasoning (or mediate knowledge) by which demonstrated (in the sense of necessary) conclusions are arrived at from general principles which are themselves regarded as axiomatic (self-evident) or as themselves substantiated as necessary deductions from other self-evident principles. In the Aristotelian and classic sense, deduction was used more widely than the above definition indicates, to cover all processes by which necessary conclusions were reached. As the modern rationalistic movement limited necessity to *a priori* general concepts and judgments and what followed from them, the tendency was to restrict deduction to mathematical and syllogistic inference. Deduction is also used commonly in a looser sense to denote any reflective movement which applies general notions and principles to the determination of particular cases — for any logical movement that proceeds from the more to the less general, or from the concept of a system, or logical whole, to the specification of its members or parts. Psychologically, the tendency is to identify it with or at least to assimilate it to the use of habit as a principle of an organizing and mastering what would otherwise be isolated detail. This looser sense is the more fruitful sense for education. J. D.

See ANALYSIS AND SYNTHESIS; INDUCTION; METHOD.

**DEDUCTIVE LESSON.** — See LESSONS, TYPES OF.

**DEFECTIVES.** — A term used frequently, but with little uniformity, in educational discussions. Properly, it includes all children subnormal physically, mentally or morally; popularly, it designates those which deviate from the normal in a marked degree. Past usage has limited its application to those who are so markedly defective as to be feeble-minded. In the following article on SCHOOLS FOR DEFECTIVES, this usage is followed. Recently, however, further investigation has brought to light many other groups of children deviating from the normal and deserving special attention in school administration. These various classifications both of the supernormal and of the subnormal are given under the title, EXCEPTIONAL CHILDREN, EDUCATION OF, and the concrete discussion of the school work done is

given under the appropriate topics, such as DEAF, EDUCATION OF; DEAF-BLIND, EDUCATION OF; BLIND, EDUCATION OF; BACKWARD PUPILS; IMMIGRATION AND EDUCATION; CRIPPLED CHILDREN, EDUCATION OF; NERVOUS CHILDREN, EDUCATION OF; TRUANCY; OUTDOOR SCHOOLS; RETARDATION AND ELIMINATION; SPECIAL CLASSES; etc. Somewhat inaccurately recent usage has tended to confine the application of the term "atypical" to that class of the subnormal on the border line and above the so-called defective or feeble-minded. The terms "ungraded" or "special classes" (*q.v.*) are frequently used with this connotation, but this usage varies widely.

For fuller treatment of the usage of this entire group of terms, see EXCEPTIONAL CHILDREN, EDUCATION OF; and for the schoolroom treatment of these groups, see SPECIAL CLASSES.

**DEFECTIVES, SCHOOLS FOR.**—The history of schools for defectives is short but interesting. The law of the survival of the fittest has prevailed even among human beings until almost within the memory of our fathers. In ancient times defectives, both mental and physical, were allowed to die or were destroyed, sometimes even being given over to be devoured by dogs. It is an interesting fact that it was a being physically and mentally defective that first aroused human sympathy, and that it was his physical troubles that made the strongest appeal. In the latter part of the sixteenth century Professor Felix Platter of Basel called attention to the pitiable condition of the cretins (*q.v.*) in these words: "Mis-shapen bodies, deformed heads, swollen tongues, almost entirely without the power of speech, staring on the ground, with darkened countenance, the object of curiosity and scorn." In 1811 a census, ordered by Napoleon, showed more than 3000 cretins in Canton Wallis, Switzerland. In 1816, the first school was founded in Hallein near Salzburg by Gotthard Guggenmoos. This school for cretins was the first school ever started for defectives. Vincent de Paul and others had made some attempt to instruct and improve idiot children, but without success. This Salzburg school was closed in 1835 for want of money. A few idiots were successfully trained in the asylum for the deaf and dumb at Hartford, Conn., about 1820, but the work was not continued.

The first impulse toward the study of the feeble-minded was given by the experience of the famous Itard in his work with the "Savage of Aveyron," who turned out to be not merely an untutored savage, but an idiot. Itard worked four years (1801-1805) with this savage. In 1828 Ferrus began at the Bicêtre his study of the idiots. The real history of schools for defectives begins with Itard's pupil, Dr. Édouard Seguin, "The Apostle of the Idiot." The year 1837, when Seguin began his work, marks the real beginning of systematic rational train-

ing of mental defectives, which has gone on without interruption from that day to this. In 1844 a commission of the Academy of Sciences of Paris reported, after a most careful examination of Seguin's methods, that previous to the beginning of his work in 1837, idiots could not be educated or cured by any means previously known or practiced, but that he had solved the problem. As so often happens, in the first flush of a new discovery greater hopes are indulged in than can ever be realized. But to this false belief that idiots could be cured was undoubtedly due much of the activity that soon appeared, and perhaps no small part of our present equipment, though the error was soon discovered. Thus advertised, Seguin's work attracted many visitors both at home and abroad.

The first institution for idiots had been established in Germany in 1835—for their care, not for their education. In 1841 another institution for cretins was founded by the famous Dr. Guggenbuhl on the Abendberg near Interlaken. Guggenbuhl had the same mistaken idea that he could cure the cretins by getting them up where there was good air and giving them good food and exercise. His institution lasted twenty years, and was then closed. Out of the inspiration from Guggenbuhl's work was founded an institution in Bath, England, and one in Baldovan, near Dundee, Scotland. Among those inspired by Dr. Seguin and his school for idiots at Bicêtre was Dr. Samuel G. Howe of the Blind Asylum at South Boston. He was so much impressed that in 1848 he started a class for the training of idiots. This led to the founding of the Massachusetts School for Idiotic and Feeble-minded Youth in 1851. New York established an institution about the same time. There had also been started a private school at Barre, Mass., shortly before this.

All of these institutions owe much to Dr. Seguin, who had come to America in 1850 on account of the political situation in France. He did much personal work for the training of defectives in all these early American institutions. Seguin's work was epoch-making. He himself called it the physiological method. It might just as well be called the psychological method, except that in his day that kind of psychology was unknown, but he proceeded to analyze the situation, and concluded that in a being where the nervous system and brain was undeveloped or was badly developed, the first important thing to do was to appeal to that brain through the sense organs by special methods. He accordingly devised elaborate systems of training the hand and the senses of taste and smell, and the eye and ear. For example, he says (*Idiocy and its Treatment by the Physiological Method*, p. 68): "Our instruments of teaching must be those that go directly to the point. In view of that necessity we must use object pictures, photographs, cards, patterns, figures, wax, clay,

scissors, compasses, glasses, pencils, colors, even books." By such methods and individual treatment, he accomplished little short of miracles in the training of idiotic and imbecile children. It ought to be said in passing that his methods have probably had even more influence upon the training of normal children than upon idiots. His book (cited above) is a classic to be read by every student of pedagogy. For the teachers of the feeble-minded it was almost the sole authority for forty years. Even yet it is the first book to be read by any student of the subject.

In the next quarter century there were seven state and two private institutions established. One of the private schools was founded by Seguin himself, and is still maintained at Orange, N.J., by Dr. Seguin's widow. During the last thirty years institutions have multiplied until there are now thirty-four state institutions in twenty-six states. There are also about the same number of private institutions. The state institutions are located as follows: Maine, Rhode Island, Massachusetts (2), New Hampshire, Connecticut, New York (5), New Jersey (2), Pennsylvania (3), Maryland, West Virginia, Kentucky, Ohio, Indiana, Illinois, Michigan, Wisconsin, Minnesota, Missouri, Iowa, North Dakota, South Dakota, Kansas, Nebraska, Montana, Washington, and California. There are approximately 16,000 feeble-minded persons in these state institutions. About 800 more are being cared for in the private institutions. On the very conservative estimate that there are two feeble-minded persons in every thousand of the population, there are in the United States 180,000 such persons. It is thus seen that less than one tenth of them are being cared for. The rest are at large, mainly a burden upon the community. Nearly all of the institutions have large waiting lists of children who cannot be admitted because there is not room. The per capita cost in state institutions varies from \$122 to \$250, according to the location of the institution and other more or less favorable conditions. The private institutions are mostly owned and managed by private individuals, and are supported by the fees. From \$600 to \$1200 a year is the usual charge for a child. Nearly all of these institutions maintain school departments in which training is done more or less on public school lines.

As said above, Dr. Seguin was the first to put the education of the idiot on a scientific basis. Since this time changes have taken place along two lines. First it was discovered that without Seguin's small groups and individual instruction, which was impracticable in large state institutions, Seguin's results were not attainable. This led to the abandonment to a large extent of the efforts at training. Part of the difficulty was undoubtedly due to a failure to follow Seguin's methods, part to the attempt to do intellectual school work. On the other hand,

there has been a tendency to take into the institutions a type of child of higher grade than Seguin worked with, and one whose very appearance tempted strongly toward a higher grade of intellectual training. This procedure was further stimulated by the fact that the mental defective often has an excellent memory, and consequently as long as his training was tested by the question and answer method he could make a good showing and give back what had been taught him with a very gratifying accuracy. In consequence, the school departments have in these later years become very prominent. That the feeble-minded child can be trained is a fact now rather generally accepted and acted upon. There are those, however, who maintain that the training can only be successful along industrial lines.

There are then three types of schools in the institutions. First, there are those whose ideal is "as near like a public school as possible." These have their kindergarden, first primary, second primary, and so on, usually to about the third or fourth grade of public school work. The three R's come in for full recognition, and besides these geography and history are given some attention, together with more or less manual training. The second type comprises those schools where manual training is given the chief emphasis and the three R's take a secondary place. These schools have extensive shops, and devote probably half the time to woodwork, basketry, knitting, sewing, domestic science, etc. The other half of the time is devoted to reading and writing, with some number work, though it does not go as far as in the other group. Nor do these schools attempt to train all the children, including the lowest grades of defectives, in these lines. Lastly, there is the group, small as yet, but apparently growing, which maintains that the intellectual work is practically useless to all but a negligible minority of mental defectives, and should therefore be discarded. It is maintained that the apparent results obtained by those who teach these things are mostly only apparent, the child simply being able to repeat what has been taught him without understanding it; and when not simply apparent have been obtained at too great an expenditure of time and energy or the great waste of the child's opportunity and good disposition. This is the theory, but it has not fully enough developed in practice in any institution. Those who hold the view lay great stress upon manual and industrial training, and accomplish great results along these lines. The children are happy, and develop into more or less useful workers at some occupation; but these same schools still teach reading, writing, and numbers to some extent, mainly because parents, and even the larger public, demand it. Which of these three views with their corresponding practices is right it is perhaps too soon to say. Yet certain facts are agreed upon. Feeble-mindedness is very largely an inherited condi-

tion, or at least the result of inherited weakness. A feeble-minded person can never compete successfully in the struggle for existence. Even the border line cases that are trained and sent out into the world barely eke out an existence when conditions are most favorable. In "hard times" they are invariably thrown out of employment, and often end up in the almshouse — sometimes the jail. With these children the power of conceptual thinking is almost entirely lacking. They must have the concrete, and even then it must be very simple and oft repeated. Abstractions are practically impossible. Attention is almost wholly of the involuntary kind. Will power and self-control are hardly capable of development.

The sixty years of effort in educating the defectives has never shown that the "intellectual studies" developed their minds at all. On the other hand, many that have had this training have proved, later, to be less useful than others of the same grade who have been trained only along manual lines. At best they never progress at more than half the rate of normal children. They seldom develop at all after twenty years of age. It is a rare thing to find one of whatever age who has a greater intellectual attainment than a normal child of eleven, and there are probably none intellectually over twelve. Left to themselves, almost none of them would ask to be taught to read or write or count. But they do ask to do manual training, and will work patiently and contentedly at it. The crucial test, however, is: what sort of lives are these children going to live? What kind of education will be of most use to them? This question again depends for its answer, upon what society decides as to its responsibility for these children. If, as seems likely, this condition is transmissible, then society ought to control the situation by keeping these children in institutions for life. Practically all persons in care of these children are agreed that this is the proper thing to be done. If that is done, then the question is rather easily answered. They have no need for reading and writing, because they can be made more useful and much more happy by other means. But even if they cannot be kept in the institution, do they then need to be taught reading and writing? In answering this two things must be considered: first, the great difficulty they have in learning, and second, the fact that the little they will ever be able to learn will at best be of very little use to them and at the worst serves in some instances to get them into trouble of one sort or another. Perhaps it is better to keep them in ignorance than to give them knowledge without moral control — which they cannot learn.

Even more vital is this question when it comes to the special classes in the public schools. (See SPECIAL CLASSES.) In 1903 the New Jersey Training School for Feeble-minded Girls and Boys opened a summer school for training the teachers of feeble-

minded children. This was the first attempt to give formal training to those who were intending to teach subnormal children. Previous to that, each institution had either secured teachers from the public schools or had trained up its own teachers, oftentimes promoting attendants or others who have shown special ability with such children. Since that time the work has grown both at Vineland and elsewhere. In the former place the school is still maintained, and teachers come from all parts of the United States to take the course. It is still the only place where teachers can have a course with a model school of feeble-minded children, where they can observe and practice. Many universities, however, have put in courses on defective children, among the rest, Columbia, New York University, Chicago, the University of Pennsylvania, and the University of Washington. Some normal schools have begun to give a little attention to the subject, and in Massachusetts all the state normal schools are required to give some instruction in the training of backward and defective children.

In turning from conditions in America to England a similar state of affairs is found. London has one large institution at Darent, managed by the Metropolitan Asylums Board. This has 2000 children. Their education is almost all manual training, which leads them directly into the shops, where they work happily at their "trade" all their lives. There are five large institutions of a semi-private character. They are general institutions for all classes of congenital defect, and are both educational and custodial. They are managed by boards of management appointed by the subscribers. Though they admit applicants from all parts of England, they are chiefly interested in particular groups of counties from which they receive some public aid. The object of the institution is best understood from the following quotation from their regulations. "That the design of this charity be, not merely to take the idiot and imbecile under its care, but especially, by the skillful and earnest application of the best means in his education, to improve his bodily powers, and prepare him, as far as possible, for the duties and enjoyments of life." There are, also, five institutions in the country, the Earlswood Asylum at Red Hill, Surrey, the Asylum for the Midland Counties at Knowle, the Royal Albert Asylum for the Northern Counties at Lancaster, the Asylum for the Eastern Counties at Colchester, and the Western Counties Asylum at Starcross. There are also two large private establishments, one at Hampton Wick, the other Downside Lodge Asylum at Bath. There are also many private homes for the care and training of the defective children. As a rule the education in these institutions is rather strongly bookish, although some manual training work is interspersed. Great stress is laid on number work in the English institutions.

In France there are only a few institutions. The hospital for the insane at Bicêtre has a children's department where are the feeble-minded. There are also institutions at Vaulchuse and Fondation Vallée — near Paris. These have much physical work after the idea of Seguin and later of Bourneville. There is also much manual training and some reading and writing.

Germany has 101 institutions, caring for about 20,000 inmates. Ten of these are state institutions. A few are city, but the most are private or church establishments. In these also the work varies. They have much manual-industrial work, but also a considerable amount of "intellectual" work. Speech training may be said to be their speciality, and great stress is laid upon it. These children leave the institutions at the age of sixteen, and go to their homes. Here the pastor or some other person is supposed to have an eye upon them, see that they get some sort of work, do not get into trouble, etc. Of course many of them marry, and in time their children come back to the institution to be trained.

This problem of the after-care of mental defectives has hardly begun to be attacked anywhere in the world. The foremost place is in certain states in America, where the law provides that a child once in an institution remains there for life. This is true in New Jersey, and practically the same thing in one or two of the states of the West. However, in most cases it is the same here as in England, Germany, and other European countries, that a child goes out when he is about sixteen years of age, if he is at all able to make a pretense even of caring for himself. This policy prevails for two reasons. In the first place, as soon as the child is trained to be partially self-supporting, or able to earn a little something to contribute to the family, the parents want him at home to help in the support. Secondly, the state authorities think that if a child is thus able to take care of himself the state should be relieved from the burden of his support. In England there are after-care committees who have some oversight over these cases after they have gone to their homes, and see that they do not do any harm or come to pauperism or criminal life. This, however, is only partially successful, and the sentiment is growing rapidly that the only safe thing for society to do is to provide for permanent custodial care of all such cases, including even the very high-grade children who pass ordinarily for normal, although, in the popular phraseology, "unmedicated." It is being recognized that these cases are generally mentally defective and never able to fully provide for themselves honestly, the result being that they eventually become either paupers or criminals. It is estimated that 30 per cent of all juvenile criminals are feeble-minded. A large percentage of our paupers are feeble-minded, and a very large per cent of prostitutes.

The students of the problem are urging very

strongly that it is vastly cheaper for the state to provide for these cases in institutions for the feeble-minded where they can be trained and made partially self-supporting under supervision, than it is to turn them out and then have to take care of them in almshouses and prisons after they have done their work of crime. The strongest support of this movement has come recently from the report of the Royal Commission in England which was appointed by King Edward to study the problem of the mental defective. They worked over the subject for four years, and then made an exhaustive report, comprising eight volumes of testimony with their deductions and recommendations. This work is a most important contribution to the problem of feeble-mindedness. They strongly recommend permanent custodial care for all cases. The following brief account must suffice for some of the other European countries. Hungary has one institution. As was pointed out, the cretins of Switzerland were the first of the defectives to attract attention. But Switzerland has not neglected her other defectives. She has thirty institutions, with 1178 inmates. Agitation is being carried on in Italy by Dr. De Sanctis and Professor Ferreri, but not much is yet done. A society of interested people maintain a day school in Rome, which Dr. De Sanctis directs. The Keller institutions in Denmark are famous, and are said to be very much up-to-date in their methods. Belgium also has an association for the propagation of the idea of care for the mental defectives. Brussels has several special classes, and Dr. De Croly of the university has a private school for feeble-minded children.

Nowhere has the training of all grades of mental defectives been carried to such an extent and on such practical lines as in America under the inspiration of Dr. Seguin. After many years of experience with mistakes and successes it may safely be said that the American ideal for the feeble-minded is care and training for all grades, such as shall raise them at least a little in the lower grades and in the upper grades make them very useful when working under the direction of intelligent persons; that they shall all and always be happy; that they shall be maintained preferably in institutions or colonies where they are protected from dangers and from their own incapacity; that those who cannot be brought into institutions shall be cared for in the public schools, taught trades, and guarded all the time either by their parents or by probation officers. The problem of education for them is first to make them happy, and second to make them as little a burden on society as possible in their own person, and in their posterity not at all — because there must be none.

**DEFERRED INSTINCT.** — See **INSTINCT.**

**DEFINING, THE METHOD OF.** — One of the modes of giving meaning to new words in the teaching of spelling and reading to children, where reliance is placed upon the use of synonyms, and verbal description of the attributes, qualities, or relations of the word. As a method it is usually distinguished from the "contextual method," where dependence is placed upon repeated and varied usage of the word in familiar context, and from the "objective method" where objects or pictures are denoted in connection with the word used. The method of word analysis or etymological definition is included as one of the forms of the method of defining. H. S.

See **SPELLING, TEACHING OF.**

**DEFINITION.** — Definition may be considered either as a product or as a process. The ordinary treatment of formal logic deals simply with the finished product. So viewed, the doctrine of definition has no significance for educational theory or practice, save as it formulates in a succinct and definite way one result of education which it is desirable to attain upon the intellectual side — the ideal goal or limiting term of that process of mental clarification and organization that constitutes definition as a process.

While, therefore, pedagogy is primarily concerned with the gradual development of definition as conceived in logical theory, the formal concept of definition serves as a point of departure for considering the nature of the processes which lead up to it. The technical notion is that definition is the statement of the intension (or meaning) of a term, this intension consisting of genus and specific difference. That is to say, only general terms (notions, concepts) can, strictly speaking, be defined. The general

term defined is regarded as one division (branch or sort) of a still more general term, this division being technically known as a *species*. Definition then states the next more general class (*genus*) in which a species falls, and also sets forth the characteristic traits (*differentia*) which mark off the species in question from other species falling in the same class. If we say that a barn is a building used for housing farm animals, "barn" is the species, "building" the genus, "housing farm animals" the *differentia* which characterizes a barn in contrast with a dwelling house, factory, woodshed, and all other objects that fall within the genus "building." To say that "heat is a mode of motion" is a defective or inchoate definition, because it states only the genus in which heat falls, without giving the properties that determine a mode of motion to be heat instead of sound, etc. To say a triangle is something with three sides gives a *differentia*, and a genus (something), but is defective as a definition because it leaves out of account the *next* higher or broader class of which triangle is one species, namely, surface. Hence the three primary rules of definition: (1) A definition must give the *essential* traits of the term defined, *i.e.* its next higher class and its peculiar or differentiating properties. (2) The definition must be exactly equivalent to the *intension* of the term defined, *i.e.* it must *not* include traits not necessary to the meaning of what is defined, and it must give *all* the traits required to differentiate it from other species of the same genus. (3) The definition must be exactly applicable to the *extension* of the term defined, *i.e.* it must apply to every object to which the term applies and to no other objects. Other rules sometimes given — as that the definition must not contain the term defined, or be couched in obscure, negative, or figurative terms, must not be redundant, etc. — are derivatives, warning against certain common ways of violating the primary rules.

Even this brief exposition brings out clearly that the *process* of defining is identical in essence with the *logical* growth of knowledge consisting in a movement toward *generalization* on one side, and toward *distinction* (or differentiation) on the other. In other words, definition is not an isolated peculiar intellectual phenomenon, but expresses the law of the fundamental evolution of knowledge, logically considered. The problem of instruction, viewed from this standpoint, is to transform the "blooming, buzzing confusion" that marks the first stage of apprehension of *every* subject into a whole which is definite and also coherent or interconnected. The *differentia* indicates the progress made in the direction of the change of vague confusion into precision and clearness; the *genus* indicates the progress made in the recognition of general principles and orderly system.

These considerations enable us to understand both the reaction against the use of the

method of definitions in textbooks and teaching, and also the truly necessary place of definitions. The objection against methods which begin with definitions of the various concepts of a subject is that it puts the cart before the horse. Since the definition expresses the *outcome* of a growth of knowledge of some subject, definitions presented ready-made at the outset have no counterpart in the genuine knowledge experience of the pupil, and hence are purely verbal, a rignarole of words. Moreover, in anticipating a gradual mental growth they do harm by arresting development, unless offered simply as provocatives or stimuli. When, however, the pedagogical reaction against definitions is carried so far as to ignore them entirely, the learning of the pupil is haphazard, and the items of his knowledge are liable to remain either vague or isolated. Every step forward in intellectual mastery of any subject must be accompanied by increased recognition of some general principle applicable to the subject binding its elements together, and by increased apprehension of exact and relevant detail. Just how far it is desirable at each forward step to put the mental clarification and differentiation into words is a matter for the tact of the teacher to decide in each given case. In general, however, the effort to put the mental result into proper verbal form is likely to stimulate the pupil to heightened activity, and to insure proper precipitation and organization of the prior experiences. The teacher must also bear in mind that progress in definition is gradual, and that each step simply represents a provisional formulation. J. D.

**DEFINITION, IN METHOD.** — One of the steps in the method of the recitation. The fourth stage, the step of "generalization," in the procedure of the "inductive development lesson"; sometimes termed "recapitulation." See RECITATION, METHOD OF.

**DEGENERATION.** — Degeneration is a pathological condition in which some tissue of the body or some organized form of activity is destroyed through disease or through some agency which interferes with normal life. Degeneration of nerve fibers which have been cut is of great importance in the study of the course followed by these nerve fibers. Degeneration of mental organizations constitutes a form of pathology which is discussed in the article on ABNORMAL and its related topics.

**DEFIANCE COLLEGE AND SCHOOL OF THEOLOGY, DEFIANCE, OHIO.** — Founded in 1884 as a coeducational institution maintaining academic, collegiate, educational, and technical departments. Students are admitted by certificate or examination; the admission requirements are about fifteen units. Degrees are given in arts, science, education, and theology. There are seventeen professors and eleven instructors and assistants on the faculty.

**DEFOE, DANIEL.** — English journalist and novelist, born in London, 1659 or 1660 — not 1661, as is generally stated; died in London, Apr. 26, 1731. He was the son of James Foe, a nonconformist butcher, his mother's maiden name being unknown. He seems to have been early set apart for the Presbyterian ministry, and at about fourteen he was sent to a dissenters' academy at Newington Green kept by the Rev. Charles Morton, who was afterwards first vice-president of Harvard College. This school appears to have been more modern in its aims and methods than most other contemporary academies. The classics and theology were not neglected, but Mr. Morton read his lectures in English and gave much attention to history and the theory of government, to geography and the natural sciences, and to the modern languages. Before he left school, about 1678, Defoe seems to have abandoned the idea of becoming a minister. Almost nothing is known of his life for the next five years. By 1683 he was established as a hose factor in Cornhill, and on the first of January, 1684, he married Mary Tuffley, who brought him several children and survived him. Shortly after, he took part in Monmouth's Rebellion, but fortunately escaped Jeffreys. Another comparatively blank period follows, during which he wrote a few tracts now lost and allied himself with the Whig supporters of William of Orange. His first definitely known publication is a satire in verse, of 1691. The next year he became a bankrupt for the sum of about £17,000, the causes of his failure not being fully known. Charges of dishonesty were brought against him later, but he appears to have striven successfully to pay off his creditors, and no severe judgment against him is warranted by the evidence accessible.

For some time after his failure he seems to have been composing his *Essay upon Projects*, which was not published until 1697. Probably the most important section of this interesting book is that entitled *Of Academies*, in which Defoe discussed the founding of an institution modeled on the French Academy, with a digression upon the English vice of swearing, proposed the establishment of a royal academy for military exercises, giving details as to studies, instructors, and the like, and finally brought in a project for an academy for women, averring that he accounted it "one of the most barbarous customs in the world" for a civilized and Christian country to "deny the advantages of learning to women." His academy for women was to be no nunnery, no secluded establishment like that proposed by Mary Astell (*q.v.*), but "should differ but little from public schools." Its inmates should be taught music, dancing, and the languages, particularly French and Italian, they should be specially instructed in "all the graces of speech and all the necessary art of conversation," and they should be "brought to read books, and especially history, and so to read as to make them understand the

world, and be able to know and judge of things when they hear of them." But while outlining the sort of studies that seemed best adapted to their needs, "to such whose genius would lead them to it" he "would deny no sort of learning."

As a writer on education, Defoe was probably more influential through such manuals of family training as the two volumes of *The Family Instructor*, *The New Family Instructor*, and *Religious Courtship*, to say nothing of his numerous books of instruction for tradesmen and merchants, such as *The Complete English Tradesman* and *A Plan of the English Commerce*, than he was as a pioneer in the higher education of women; but it is in the latter capacity that he displays the best features of his genius. It would be unfair to minimize, however, his services as an apostle of a modern and practical education. Whether he was defending himself from the charge of illiteracy, often absurdly brought against him by his contemporaries, or writing essays in the newspapers, or composing in his old age a book on the training of *The Complete English Gentleman*, — not published until 1890, — he never tired of recommending the study of history and geography and the sciences and a special attention to speaking and writing the English tongue.

Before the close of 1700 he had published ten or more pamphlets dealing with the chief political and ecclesiastical questions of the hour, and he had made himself something of a leader among the Whigs. In January, 1701, he issued, in defense of William III, his best verse satire, *The True-Born Englishman*, which attained immense popularity and secured him the personal confidence of the King.

With the accession of Anne came a revival of the hopes of the High Church Tories and a reverse of fortunes for Defoe. In an evil moment he undertook an ironical reply to the invectives of the bigots against the dissenters. His brilliant *Shortest Way with the Dissenters* (December, 1702) was voted a libel; he went into hiding, and a reward was offered for his discovery. He was captured in May, 1703; was tried and found guilty, and was condemned to stand three times in the pillory, to pay a fine, and to be imprisoned. There is evidence that he was for some time greatly unnerved, but when he saw that his fate was sealed, he wrote his defiant *Hymn to the Pillory*, and when he underwent the public portion of his punishment, he found the crowd sympathetic instead of hostile. From this time on his moral nature seems to have been warped, and he guarded against future persecution by evasions and direct falsehoods with regard to the authorship of his writings. He remained in Newgate until November, 1703 — not until August, 1704, as is usually stated. He owed his release to Robert Harley, Secretary of State, who desired to use his talents as a journalist and political agent. In February, 1704, he began his newspaper,

the *Review*, in which he discussed political, ecclesiastical, and commercial topics with a moderation and acumen unparalleled at the time. It came to an end in 1713, and it has the honor of having given hints to Addison and Steele. Meanwhile Defoe had rendered valuable services to Harley by traveling through the country as a sort of political spy. In the fall of 1706, he was sent to Edinburgh to help to smooth the way for the union between England and Scotland, and his letters, his tracts, and his *History of the Union* show that he deserves to rank high as a secret political agent. With the return of Harley to power in 1710 Defoe's pecuniary fortunes seem to have improved, partly through a pension, but his standing as a journalist and a man was greatly lowered. He protested his independence, but when he put his *Review* and his tracts at Harley's service in demanding peace with France, he was read out of the Whig ranks, and denounced with only too much truth, as a renegade and a mercenary. Yet there is no proof that he may not really have thought that the war had lasted long enough, and it is clear that in his courageous opposition to the Schism Bill, which threatened the privileges of the dissenters to educate their children, he was true to his former liberal principles. There is rather conclusive evidence, however, that by this time he had become adept in the practice of writing on both sides of a given question. Despite the protection of the Prime Minister, he was not entirely able to escape those terrors which the law then held over rash journalists. He was sincerely alarmed at the progress the Jacobite cause was making in England and Scotland, and he wrote in 1712-1713 several tracts against the Pretender. Some of these, such as his *Reasons against the Succession of the House of Hanover*, were plainly ironical, but his enemies declared that they were in reality the treasonable pleas purported in their titles, and they instituted legal proceedings against him. Defoe made matters worse by commenting in the *Review* upon the partisan conduct of the Chief Justice, and as a result he suffered a short imprisonment for contempt. He was released in order that he might edit *Mercator* in the interest of Bolingbroke's proposed treaty of commerce with France; and later in 1713, through his own shrewd scheming, he secured a sort of blanket pardon for his journalistic indiscretions.

The death of Queen Anne ushered in a still more discreditable period of Defoe's career. He was arrested for libeling the Earl of Anglesey, and was kept in grave suspense by the postponing of his trial. He seems to have lost the favor of Harley, then Earl of Oxford, by writing the three parts of *The Secret History of the White Staff*, in which damaging admissions were made with regard to Oxford's administration. He tried without success to rehabilitate himself in the public eye by writing his exceedingly plausible but misleading *Appeal to Hon-*

*our and Justice* (1715). Then he appears to have entered upon what can be described only as a debauch of pamphlet writing. Probably no one will ever be able to straighten out his bibliography for the single year 1715, which was also marked by the first part of *The Family Instructor* and by a *History of the Wars of Charles XII*. His contemporaries represented him as capable of writing two thick pamphlets a day on any subject, and the charge contains a measure of truth. Perhaps it was his services as a pamphleteer in the Hanoverian interest that induced Chief Justice Parker to lend an ear to Defoe's petitions and to omit to sentence him after he had been found guilty of the libel of the year before. We know at least that Parker introduced him to Lord Townshend, the Secretary of State, who employed him as a spy in the offices of the Jacobite newspapers.

His chief, but by no means his sole journalistic employments, during this period, were with *Mercurius Politicus*, *Mist's Journal*, and *Applebee's Journal*. The publisher of the last-named issued many of the confessions of the chief criminals, and thus Defoe was brought in contact with the low-class characters, whom he described in such stories as *Moll Flanders* and *Colonel Jacque*. Before he began writing fiction, however, he fairly outdid himself in disreputable journalism by low attacks upon Toland and Tindal, by rather ribald contributions to the Bangorian Controversy, and by forging — that seems to be the word — the *Minutes of Mesnager*, the agent Louis XIV had sent over to arrange the preliminaries of peace. Yet he found time in the midst of this more than questionable activity to add a second volume to *The Family Instructor* and to compile that exemplary book, *Memoirs of the Church of Scotland*.

At last, with April, 1719, the Defoe the world knows, the Defoe whom, if we choose, we may call the real Defoe, emerges with his great classic story, the first part of *Robinson Crusoe*. How he came to write it is still a mystery, although it is clear that for some years he had been developing his powers as a narrator and his remarkable equipment in point of knowledge for realistic description of life whether at home or abroad. His central theme, the shipwrecked sailor struggling successfully with the pitiless forces of nature, was sure, if adequately treated, to give his book universal appeal; but that theme had been handled before, and others before Defoe had attempted the narrative of adventure without achieving his success. If he had been a mere journalist, his book might have gone the way of its predecessors. But he was that unaccountable thing, a man of genius, and he produced a classic. Nor is *Robinson Crusoe* merely a literary classic. In the light of Rousseau's well-known opinion of its merits and of its wide use in the nursery and the school-room throughout the world, it is fairly to be called an educational classic as well.

Imagination is also to be seen to a greater or less degree in many members of the extraordinary series of works produced by Defoe between 1719 and 1727 — in the life of *Duncan Campbell*, in which he discusses the education of the deaf and dumb, in *Captain Singleton*, which illustrates his exceptional knowledge of the geography of Africa, in the *Memoirs of a Cavalier*, in *Moll Flanders*, *Colonel Jacque*, and *Roxana*, and above all, perhaps, in that tremendously impressive book, the *Journal of the Plague Year*. After about five years his gift of story-telling, which did not really display itself until he was nearly sixty, seems to have flagged, unless we agree to give him the interesting "memoirs" of Captain Carleton, of 1728, and the excellent *Adventures of Robert Drury* of 1729; but his energy as an author continued almost unabated until about two years before his death.

It is scarcely too much to say that in quantity, and one might almost add in quality and variety of production, Defoe is the most marvelous old man in the history of literature. Merely to enumerate the books and tracts of his old age would swell this article unduly, and it is scarcely likely that we shall ever know the full extent of his productions. It would be unjust to him, however, not to mention his timely sociological writings, the quaint series of books on occult subjects, tracts like *Mere Nature Delincated*, which display his interest in the education of the mentally deficient, and, last but not least, his valuable and entertaining *Tour through the Whole Island of Great Britain*, in three volumes, one of the least accessible of all his works, but full of information on an astounding variety of topics, including schools.

In the fall of 1729, when he was writing *The Compleat English Gentleman* and the monograph extracted from that, *Of Royal Education*, he was suddenly taken ill. Whatever the cause, we know that he was for a while in hiding, and that, when he died in April, 1731, the end came, not at his home, but in a lodging house away from his family. Unless illuminating documents are found, these last years of a life far from clearly known in other periods must remain perplexingly obscure. It seems unlikely, however, that, if his mind was clouded at all, it remained clouded to the end. There is strong bibliographical evidence that at the end of 1730 and the beginning of 1731 he was writing and publishing with an energy unusual in any man of over seventy, and almost unusual for Defoe himself.

To attempt to sum up such a character and career is a hopeless task. Although to a certain extent unprincipled, he was probably more sinned against than sinning, and he had many fine traits, chief of all his staunch zeal for civil and religious liberty. He was probably the most open-eyed and modern-minded man of his age. He was by all odds its greatest journalist, and perhaps in this capacity he has never

been surpassed. He was a true and influential educator, not only in his specific writings on education, but in his numerous works of miscellaneous information. He was a fair historian for his day, and he was the first Englishman to write fiction which can be termed great. For whatever the defects of his novels in plot and characterization, they are great in their realistic holding power. Finally, he is the author of the most universally current classic of modern times.

The ablest work yet produced upon Defoe is Walter Wilson's *Memoirs* in three volumes, (1830). William Lee's *Life and Newly Discovered Writings* (3 vols., 1869) is valuable, especially for its bibliography of 254 items. See also the biographies by William Minto and Thomas Wright. The most complete edition of the works, which scarcely contains a tenth of them, is Tegg's of 1840-1841. The best modern edition of the *Romances and Narratives* is that prepared by Mr. George A. Aitken, whose contributions to Defoe's biography have been of great value. In a forthcoming life and bibliography the present writer hopes to supply a good deal of new biographical material and to extend very considerably the list of Defoe's writings, perhaps by a hundred titles. **DEGREES.** — The official recognition bestowed by a university that a certain step or grade has been attained in a branch of learning. Historically two elements entered into the granting of a degree corresponding with the early history of the university (*q.v.*). The members of the faculties consisting of the masters of the faculties, composed different guilds and held themselves responsible to demand certain requirements from those who wished to enter their body. After inquiring into the fitness, mental and moral, of the candidates, they presented them to the Chancellor (*q.v.*) representing the ecclesiastical authority for permission to incept or for the license to begin teaching. The candidates were then called *magistri*, *doctores*, *professores*. Thus the early university knew only one degree — the attainment of mastership. Originally the baccalaureate was not a university recognition at all. It denoted a stage or step toward the mastership, but was granted by the nations and the rectors of the nations after a ceremony corresponding to that for the mastership. The course for the young student who entered the university thus came to be as follows. He

enrolled himself under a master with whom he began reading the prescribed texts in the Trivium (*q.v.*). At the end of three or four years, when he could define and determine and could dispute with a master in grammar and logic, he was admitted to the examination before representatives of his own nation, and, if successful, became a bachelor, *i.e.* a recognized candidate for a mastership. He was now a pupil teacher and was permitted by his master to teach the younger students. In the course of time the baccalaureate became an inferior degree. So far this procedure prevailed at Paris. A candidate who wished to proceed to the degree of master or doctor — and not all did so — continued to attend lectures of other masters, had to dispute, and to hear all the books prescribed by the faculty. In addition he had to deliver some lectures himself.

The whole course from matriculation lasted about six years. At the end of this period, if the candidate had reached the age of twenty, he was examined by the Chancellor's board to see if he had met the requirements as to residence, reading, and exercises; if worthy, he took an examination set by his faculty, and could then present himself for the Chancellor's license. The examination at the license ceremonial was purely formal as early as the fourteenth century. The license gave the candidate the right, which he was expected to exercise, to incept within six months. The changes by which the B.A. was gradually eliminated in some universities and given a place of importance in others were slow. At Paris the tendency was to shorten the period between matriculation and the baccalaureate; in 1366 the minimum period for obtaining the master's license was four and one half years; soon after, this was shortened to three and one half years, and the practice grew up by which students came to Paris already with the baccalaureate standing from other universities. Eventually the baccalaureate and matriculation became synonymous. In Scotland the baccalaureate disappeared entirely. The English nation at Paris required the candidate for the baccalaureate to be at least nineteen and to have spent four or five years in the faculty of arts. When this practice was taken over at Oxford, the B.A. continued for a time to be the preliminary stage to the M.A., but as the schools improved and candidates came to the universities at the age of sixteen, it became more and more impossible to enforce the requirements of prolonged residence; hence the time was shortened in some cases, or actual residence was dispensed with and candidates could come up for their master's degree at the end of the statutory period. The latter practice prevailed at Cambridge when it was incorporated in the statutes in 1608.

For the higher faculties — theology, law, medicine — additional periods of study were added after the degree of master. Thus three

years of study were required for the standing of bachelor in theology, and eight years for the degree of doctor in theology. In 1366 the complete course extended over sixteen years, and in 1452 over fifteen years. For the degree of Doctor of Civil Law at Cambridge ten years' study was necessary, although the arts course was not required as a preliminary. In medicine the arts degree was required, five years of study and two years of practice before the degree could be obtained. The titles of master, doctor, professor were originally synonymous; master, however, was more commonly employed in the faculties of theology, arts, and medicine at Paris; doctor, professor, and dominus were used at Bologna in the faculty of law; and doctor in connection with canon law at Paris. In the fifteenth century the title of doctor was gradually retained for the higher faculties, and master for the faculty of arts. In Germany the title of doctor spread to other faculties, and the one degree of Doctor of Philosophy was and has continued to be given in all faculties. In England the only instance where the doctor is only equivalent to the master is in the degree of Doctor of Music.

**Present Position.** — Except on the continent of Europe, the tendency has been to increase the number and titles of degrees. Germany gives only the doctorate in all faculties. In France the university degrees are the *licence* and the *doctorat* in the faculties of arts, sciences, theology, medicine, and law. The *baccalauréat* is prerequisite for all degrees, and in arts and sciences is obtained in the secondary schools. The *licence* may be obtained by examination after residence of one or two years. For the doctorate in arts and sciences, which can only be obtained on passing the twenty-fifth year, theses must be presented and defended. The degrees in theology are obtained by examinations, both written and oral. In the faculty of medicine neither the *baccalauréat* nor the *licence* are required for the doctorate, which can be obtained in a minimum period of four years, but usually requires longer. In the faculty of law the *baccalauréat* is incorporated with the *licence*, which is obtained at the end of three years' study, while two years more are required for the doctorate. All degrees in France are conferred by the State, and carry with them the privilege of practicing in the faculties in which they were obtained.

England has witnessed a rapid increase in the number of degrees within the last half century. Oxford and Cambridge have remained the most conservative, and have only added the scientific degrees. Oxford grants the B.A. at the end of four years' study and the necessary examinations in all but the superior faculties. The M.A. degree may be obtained by retaining one's name on the books of a college and paying the necessary fees five years after obtaining the bachelor's degree. The Litt.D. is given on presentation of evidence of literary

or scientific work of importance. Other degrees are the Mus. Bac. and Mus. Doc., given on examinations without requirement of residence; B.C.L., only conferred on those holding the B.A., and D.C.L., granted on a dissertation; in medicine the degree of M.B., granted after a study of six or seven years, in the course of which the degree in arts must be taken; the M.D. is given on a dissertation with the M.B.; the degree in surgery (B.Ch.) is conferred *ipso facto* with the M.B. The degrees in theology (B.D. and D.D.) are only conferred on candidates who have obtained the M.A. and are in priests' orders. The degrees of B.Sc. and B.Litt. can also be conferred under certain circumstances. The degrees at Cambridge are similar, with the exception that the LL.B. and LL.D. take the place of the B.C.L. and D.C.L. and only three years' residence are required for the B.A.

In the more recently established universities the degrees are differentiated more according to the faculties. Thus all, including the Scotch universities, confer the B.Sc., first instituted by London in 1860; in the University of London this degree is given for pure science, engineering, economics, political science, including commerce and industry, agriculture, and veterinary science. The University of Liverpool gives a separate degree in engineering (B.Eng.); the universities of Manchester, Birmingham, and Leeds give the degree of B.Com. in commerce and B.Sc. Techn., and D.Sc. Techn. in the branches of technological science. The requirements of residence in these universities are in almost all cases three years for the first degree, except in medicine, which demands at least five. The masters' degrees are obtained usually three years after the bachelors'; and the doctorate after three more years. Nearly all the universities have two examinations and two courses for the bachelors' degrees — ordinary and honors. The ordinary courses are fairly general; the honors courses require more specialized study in a narrower field. Graduates in honors courses usually proceed to the M.A.; others must take a second examination. In the University of London all degrees, including the doctorate, are granted only on examination. For the doctorate (D.Litt., D.Sc., and in Birmingham University and Scotland, D.Phil.) evidence of literary or scientific research of value must be produced as a general rule. On the whole, however, a very small number of students proceed to the degree of doctor.

There are no separate degrees to be conferred *honoris causa*. As a general rule any of the doctorate degrees are granted in such cases. In some instances the masters' degrees are used for honorary conferment. It may be said that the majority of those in England who hold the degree of doctor, except in the faculty of medicine, received it as a mark of honor from the universities.

**America.** — The multiplication of degrees has been carried to an extreme in this country

accompanying in extent the opportunities for specialization in the different studies. At the same time a large number of the degrees are worthless, given by institutions which by no means come up to college rank either from the point of equipment, staffing, curriculum, or requirements. The increase in the number of degrees is of recent growth, dating perhaps from the middle of the last century. The Ph.D. was first conferred in 1861. Since then forty-seven different degrees are conferred, according to the Report of the Commissioner of Education for 1907. No distinction is made between degrees obtained on examination and honorary degrees. This raises a question of considerable difficulty, for in addition to the practice of granting degrees on very low requirements, there also prevails the practice of conferring honorary degrees either for insufficient reasons or at a price. The result is that the holders of *bona fide* degrees from institutions of good standing are in danger of being classed with those whose degrees are worthless. A movement was begun some time ago to restrict certain degrees for honorary conferment. These are the L.H.D., S.T.D., D.D., LL.D., D.C.L., Mus. D.; these would tend to be distinguished from those degrees which are obtained by examination.

The most usual requirements for the bachelor degrees is a four years' course of study, accom-

panied by the necessary examination. In the larger institutions the master degrees are no longer conferred in course, but only after one year of specialization in a definite field, accompanied by examination and a thesis in most cases. For the higher degrees of doctor two or three years' study and the presentation of an original piece of research work are required. Most faculties have the bachelor, master, and doctor degrees. Medicine alone has only the doctorate. There are also higher degrees in law, as the LL.M., D.C.L. (Yale), and J.D. (Chicago). In divinity there are only the bachelor and doctor degrees.

The accompanying is a representative list of degrees granted in this country, with the number of each kind conferred on men and women in 1907-1908. (From *Rep. Com. Ed.*, 1908, p. 615.)

In addition to these there are also granted the following degrees in medicine:—

- C.M. (*Chirurgia Magister*), Master in Surgery;
- D.M., Doctor of Medicine;
- D.M.D. (*Dentaria Medicinæ Doctor*), Doctor of Medical Dentistry;
- D.V.M., Doctor of Veterinary Medicine;
- V.S., Veterinary Surgeon.

In law the following degrees are found:—

- B.LL. or LL.B. (*Legum Baccalaureus*), Bachelor of Laws;
- D.C.L., Doctor of Civil Law;
- J.D. (*Juris Doctor*), Doctor of Law;
- J.U.D. (*Juris Utriusque Doctor*), Doctor of Civil and Canon Law;
- LL.D., Doctor of Laws.

It is somewhat significant that in France only 100 doctor degrees were granted in 1909. With a life of thirty-five years for the degree, there will be in existence at any one time only 3500 French doctors. In that period there will be in the United States a supply of more than 18,000 in doctors alone. (See *Journal of Education*, London, March, 1910).

lature of Delaware, opened in May of that year under name of Newark College, which was changed in 1843 to the present title. After the passing of the Morrill Act (*q.v.*) the government of the college was changed and a share was given to the state. (See DELAWARE, STATE OF.) As thus reorganized, the college was opened in the autumn of 1870. Subsequent appropriations by Congress, automatically increasing, will amount within the next five years to \$41,000 annually, one fifth of which, however, goes to the college for colored students at Dover, Del. The state has also made liberal annual appropriations, varying from \$10,000 to \$25,000. In organization the institution is a college, with classical, scientific, agricultural, and engineering courses; there is also a two years' course in agriculture. The Delaware Experiment Station in Agriculture is a department of the college. Buildings and equipment are valued at \$244,800. A farm of 217 acres was purchased for the college by the state in 1907, and supplies facilities for practical instruction in agriculture. The total annual income is about \$43,000. The average salary of a professor is \$1650. There are (1909) twenty-three members on the instructing staff. There were in 1910-1911 165 students.

C. G.

#### DELAWARE STATE COLLEGE FOR COLORED STUDENTS, DOVER, DEL. —

Established under act of Congress of 1890 and under the act of the General Assembly of the state of Delaware on May 15, 1891. The latter act divides the money given by Congress between the Dover institution and the Delaware College at Newark. The college, which is co-educational, maintains courses in agriculture, mechanical arts, the subjects fundamental to these studies, and normal. Candidates are admitted on passing a satisfactory examination in common school subjects. Degrees are given in engineering, agriculture, and science. There is a faculty of ten members.

**DELAWARE, STATE OF.** — One of the thirteen original states, and the first to ratify the Federal Constitution in 1787. It belongs to the South Atlantic Division of states, and has a land area of 1960 square miles. Next to Rhode Island, it is the smallest state. Texas would make 136 states the size of Delaware. For administrative purposes the state is divided into three counties, and these, in turn, into school districts and incorporated places. In 1910 Delaware had a population of 202,322.

**Educational History.** — The work of the Swedes, Dutch, English, and the different religious societies did much toward local education in the early history of the Delaware colony, but the first legislation dates from 1744, when an act of the Assembly ratified all conveyances of lands or houses previously made for educational purposes. The first act involving any

grant was made in 1772, when a lot of land in New Castle was granted for a school. The first constitution of the state, adopted in 1776, made no mention of education. In the constitution of 1792 a short section was inserted to the effect that "the Legislature shall, as soon as conveniently may be, provide by law for establishing schools, and promoting arts and sciences." This section was reproduced in the constitution of 1831, and remained unchanged until the adoption of the new constitution in 1897. In 1796 the beginnings of the school fund were made, when it was ordered that the income from marriage and tavern licenses should be appropriated to such a fund. This accumulated until 1817, when the income was used for the first time, \$1000 being appropriated to each county for the instruction of the children of the poor in reading, writing, and arithmetic. In 1821 aid was given to Sunday schools, and \$1 per quarter per child was given to teachers who taught pauper children in day schools. By 1829 the school fund amounted to \$151,643.42, and the annual income to \$9,255.50 and in this year, the first free school law was adopted. This law laid down the main outlines of the school system which has since prevailed. School commissioners were appointed for each county, who were to lay the county off into school districts; county superintendents were to be appointed by the Governor; an annual school meeting was to be held; provision was to be made, by subscription or voluntary contribution, for the support of a free school in the district; and each district was to receive from the state fund a sum equal to that so raised, but limited (in 1830) to \$300 per district. The public schools of Wilmington date from this time. By 1833, 133 districts had been organized. The fund was now insufficient, and a decline in the schools set in, due to the unwillingness of the people to tax themselves further. In 1835 \$25,000 was raised for the school fund by a lottery; and in 1837 the surplus revenue was distributed equally to the counties to be used for school purposes, and the requirement of district taxation was reduced to \$25, to share in the school fund. In 1843 the first state educational convention met, and this convention put itself on record as opposed to compulsory school taxation. By the law of 1852 the schools of Wilmington were reorganized and given an independence which they have since maintained. Nothing further was accomplished until 1861, when a law was passed, raising the required tax to be voted to \$75 in New Castle County, to \$100 in Kent County, and to \$50 in Sussex County, and authorizing further district taxes up to \$400 for maintenance, and up to \$500 for buildings. This law made taxation and a school in the district compulsory instead of optional with the voters, and marked a great advance.

A law of 1875 provided for the appointment by the Governor of the first State Superintendent

ent; for an *ex officio* State Board of Education, whose duties were prescribed; for the first certificates for teachers, to be issued by the State Superintendent; and raised the required district tax to \$60 for Sussex County, and to \$100 for Kent and New Castle. In 1875 the first teachers' institute was held, and after 1883 state aid of \$100 per county was given for them. In 1881 the State Superintendent was authorized to purchase all the school books needed in the state and to sell them to the districts at actual cost. In 1887 a new school law was enacted, which abolished the office of State Superintendent; reestablished the county superintendency; definitely provided for county teachers' certificates; stopped the state purchase of textbooks; reconstituted the State Board of Education, and gave it power to adopt textbooks for use in the schools of the state. In 1891 free textbooks were provided for all public school pupils. Between 1875 and 1881 what colored schools existed were supported entirely by the colored people. In 1881 the first state appropriation (\$2400) was made for colored schools. This was gradually increased to \$9000 in 1891, and in 1898 colored school districts were ordered to be laid out in each county, and were placed on the same basis for state aid as white districts.

In 1897 a new state constitution was adopted, and in this definite provision for education was made for the first time in the history of the state. The General Assembly was directed to establish and maintain "a general and efficient system of free public schools," and was given power to enact a compulsory education law. It was also directed to appropriate not less than \$100,000 annually, to be added to the income from the Public School Fund, which was to be apportioned equitably among the school districts of the state for teachers' salaries and free textbooks only, and no distinction on account of race or color was to be allowed in making the apportionment. Separate schools for the two races were provided for; aid to sectarian or denominational schools was forbidden; all school property was exempted from taxation; and taxation for education was authorized. Under the authority of these new constitutional provisions, the school law was revised in 1898, though most of the features of the old law were retained. In 1899 state aid for the tuition of pupils in graded schools was provided for. In 1901 the apportionment law was revised and made more equitable, and the local tax requirements raised. In 1903 \$1000 per county was granted to help to pay the tuition of pupils in normal schools designated by the county school commissioners, and \$6000 a year for two years to aid in building and repairing colored-district schoolhouses. In 1907 the compulsory education law authorized by the Constitution was enacted; and school districts were now allowed to borrow money by bonds or mortgage to build or repair school buildings.

**Present School System.** — The school system of Delaware, as at present organized, is as follows: At the head is an *ex officio* State Board of Education, consisting of the Governor, the Secretary of State, State Auditor, the president of Delaware College, and the senior member of each county school commission. County superintendents, though not actually members of the board, are required to attend each of its regular meetings. The State Auditor acts as secretary of the State Board, issues all reports, and virtually acts as State Superintendent. This State Board meets quarterly, and has general supervision of the schools of the state; adopts textbooks for the schools, and fixes the prices at which they are to be sold to the districts; compiles separate sets of examination questions for the examinations for teachers in white schools, colored schools, and graded schools; prepares all blanks used; hears and determines appeals; and reports to the General Assembly. In considering appeals of colored teachers or colored school committees, the president of the state college for colored students temporarily replaces the president of Delaware College on the board.

For each county, the Governor appoints three county school commissioners for three-year terms, not more than two to be of the same political party. This board has control of the schools of the county, subject to the supervision of the State Board. They hold quarterly meetings; make rules and regulations for the government of the schools of the county; investigate school work and school conditions in the county, including schools in incorporated towns, Wilmington excepted; oversee the work of the county superintendent, aid and advise him, and hear complaints against him or any teacher under him; may condemn school buildings, or order them to be repaired; and may change the lines of districts on petition. The Governor also appoints a county superintendent for each county, who has general supervision of the schools of the county. He attends the meetings of the State and County boards, and reports as to conditions; visits the schools; executes orders of the State Board; compiles statistics; conducts teachers' institutes and examinations, and issues teachers' certificates; and oversees the enforcement of the compulsory education law.

For each district, white or black, there is a school committee of three, elected by the voters of the district at the annual school election. The annual school meeting can decide on extra district taxes, and on the location of the school buildings. The district School Committee repairs the schoolhouses; buys supplies; employs and dismisses teachers; makes rules and regulations; collects and receives all taxes and apportionments, and expends the same; makes an annual report to the State Auditor, and to the district school meeting; and compiles an annual list of taxable property, by race,

in the district. Provisions are made in the law for union school districts and for graded schools; for the condemnation of sites for schools; for the establishment of kindergartens, where desired; and for free textbooks for all the schools of the state, except those in the city of Wilmington. The State Board contracts for and pays for all textbooks, and the districts have the cost of the books ordered deducted from their state school fund apportionment. For the government of the city of Wilmington, and the nature and extent of its school system, see special article on WILMINGTON.

*School Support.* — The school fund, the origin of which has been described above, now amounts to about \$350,000, and is slowly increasing in amount from various sources. The interest on this fund, together with an annual state appropriation of \$132,000 (law of 1901), is apportioned equally to all the districts in the state, white and black, on the basis of the number of teachers actually employed for 140 days, with a limit of 165 teachers to any single district, and provided always that the district has raised, by local taxation, not less than \$100, if white, and \$50 if colored, for each teacher employed. By providing a room and raising the required tax before Aug. 20, advance apportionments for teachers may be received. Any unused state school fund remaining on hand, and all debts for textbooks bought of the state, are deducted in making the new apportionments. There is no county school tax, all other money needed for schools being raised by district taxation. As black districts are separate from white districts, and as the assessment and poll tax lists are also compiled separately, this means that each race maintains its own school system, except for the state aid which is given equally to all.

In expenditure for schools Delaware falls into the group of Southern states, the average expenditure per pupil per day being but 11.7 cents at the last report, which is lower than any Northern state. Only eight Southern states are lower, while the average of the North Atlantic group was 23.7 cents. In amount raised per child, five to eighteen years of age (\$9.51) or in amount raised per adult male (\$8.63), the state occupies about the same relative position.

*Educational Conditions.* — Of the population of 1900, 16.6 per cent were negroes, and 7.5 per cent foreign born. 41.4 per cent of the total population of the state is located in the one city of Wilmington, 5 per cent live in smaller incorporated places, and 53.6 per cent live in country districts. Averaged over the state as a whole, the state has much more wealth back of each child than have the Southern states, averaging practically the same as Pennsylvania, but the wealth is not evenly distributed, the northern part having much greater resources than the southern. Considering the resources of the state, the school term required (seven

months) is long, and the average number of days attended by each pupil enrolled (116.6 days) is higher than any other state in the two Southern divisions, being about the same as the average for the North Central Division. In percentage of the colored population, five to eighteen years of age, in school (69.09 per cent as against 76.7 per cent for the whites), Delaware stands fourth in the list of the Southern states. In illiteracy, 12 per cent of the total population, ten years of age or over, was illiterate in 1900. Among the total white population, 7 per cent; among the negroes, 38.1 per cent; and among the foreign-born whites, 18.3 per cent were illiterate. In 1907, a compulsory attendance law was enacted, which requires all physically and mentally capable children, between the ages of seven and fourteen, to attend school five months in each year, but the same law gives to each district the right to reduce the time to three months, and excuses all children living over two miles from a school-house from the provisions of the law. The assessor is to compile a school census, seven to fourteen years, each year, and send a copy to each principal teacher to help him in his duties. Any town may appoint attendance officers, but, if it does not, the secretary of each school committee is instructed to enforce the law. The County Superintendent, and, in the city of Wilmington, the City Superintendent, is to mail the notices to delinquent parents. If the officials fail to enforce the law, they are to be fined \$25, and the state is to withhold, in addition, one fourth of the state apportionment to the district.

The curriculum of the schools is confined to the elements of the common school branches. Manual training is taught only in the city of Wilmington. Graded schools, in which advanced instruction in the elementary school branches and possibly the beginnings of high school work are given, have been organized in most of the towns. The rural school buildings are very poor, particularly in negro school districts.

*Teachers and Training.* — At the last report the state employed 897 teachers, 17 per cent being men. The average salary of all teachers in the state, the city of Wilmington included, is only about \$10 a month; many teachers in rural districts are teaching for \$25 or less. Three grades of teachers' certificates are issued by county superintendents on an examination on questions prepared by the State Board of Education. Teachers in graded and teachers in ungraded schools have separate sets of questions, and these questions are again divided for teachers in white schools and for teachers in black schools. A professional certificate is valid for ten years; a first-grade certificate for five years; and a second-grade for two years. The grade of certificate is determined, in part, by the percentages made in the examination. County

superintendents may endorse certificates from other counties and give graduates of colleges and normal schools a one-year certificate without examination, but no provision exists in the law for recognizing the certificates of teachers from other states. The state maintains no normal schools, but each county school committee is allowed \$1000 a year, to aid pupils to study in approved normal schools elsewhere, the maximum grant being \$2 per week; and the pupils aided are required to obligate themselves to return and teach in the county for a stipulated time.

*Secondary and Higher Education.*— There are nineteen public and three private high schools in the state, of which one public high school is open to the colored race.

The state college for colored students at Dover, opened in 1892, and Delaware College at Newark, opened in 1834, and reorganized as a state land-grant college in 1869, are nominally state institutions, and occasionally receive some aid from the state; but their income for yearly maintenance comes almost entirely from interest on endowments, grants from the Federal government, and student fees. Both are small institutions. There are no other higher institutions in the state. The Ferris Industrial School for boys, at Marshalltown, and the Delaware Industrial School for girls, at Wilmington, are two schools of a reformatory type, which are aided by the state.

**DELINQUENTS.**— See CORRECTIONAL EDUCATION.

**DELIRIUM.**— A general name given to a collocation of mental states of a transitory nature, with or without an accompanying bodily or other mental disease. The mental states which together constitute delirium are disorientation, incoherence, hallucination, followed by an amnesia (*q.v.*) for most of the time during which the incoherence and disorientation persisted, and sometimes an amnesia for events preceding the delirium. In addition to the mental abnormalities (*q.v.*) just mentioned, other psychic disorders are sometimes found, but these appear to be incidental rather than necessary. A few authors dispute the view that hallucinations are necessary to constitute a delirium, but most authors consider them an essential element of the disease. In any case they are known

to be found in a very large percentage of cases, and for present purposes they may be considered an intrinsic part of the delirium, and the discussion of their essential rôle be considered an academic question. The mental state in dreaming is similar in many respects to that found in delirium. (See DREAM; SLEEP.)

Delirious states may accompany infections of different kinds, with their resultant fevers, defervescence, and collapse. Inanition, various traumata, extreme cold, extreme heat, asphyxia, anemia, and many other abnormal bodily conditions are accompanied by deliria. In addition to the deliria accompanying infections, which may be described as auto-toxic, others are found after the taking of drugs. Alcohol, morphine, and hashish are well-known producers of delirium, but hyacinine, cocaine, the bromides, acetanilid, and many other medicinal agents also produce the condition, especially after long-continued use.

In children the effects of delirium may be noticed for much longer periods than in adults, and the practice is to be commended of keeping such children away from school for several weeks after the delirium and any physical effects of the bodily disease have disappeared. If permitted to take up school work too soon after an attack of delirium, the child may again become delirious, particularly noticeable at night or in sleep if not in the waking state, and permanent mental injury may result from the mental stress. In the school training of children the possibility of an amnesia for a period preceding the delirium should be kept in mind, and in each case the memory of school work should be determined by the teacher both for the benefit of the child and to prevent time waste of herself and that of the other children in the class.

**DELL, WILLIAM.**— Master of Gonville and Caius College, Cambridge (1649-1660). He was a Puritan leader, who declaimed against "the gospel of Christ according to Aristotle." His views on education are to be found in a tractate, *The Right Reformation of Learning, Schools and Universities, according to the State of the Gospel, in the true light that shines therein.* He regards the civil power as by right entitled

to take care of the education of youth. Schools, if wanting, should be erected throughout the whole nation, not only in cities and great towns, but also as much as may be in all lesser villages. No women, "but the most sober and grave," should be permitted to teach village schools. Magistrates must give encouragement and assistance. The subjects of instruction should be: to read their native tongue, and to read the Holy Scriptures. In the greater schools of the cities and greater towns, Latin and Greek should be taught, and Hebrew, "the easiest of them all," for the Old Testament's sake. All heathenish authors should be avoided, for it is better "to want their language than be possessed of their wickedness." Christians should forget the names of Greek and Latin gods and muses. In universities and colleges logic and mathematics should be taught, also physics and law. The following very important passage has not received its due attention. "Why universities or colleges should only be at Cambridge and Oxford, I know no reason. . . . It would be more advantageous to the good of all the people, to have universities or colleges, one at least in every great town in the nation, as in London, Essex, Bristol, Exeter, Norwich, and the like; and for the state to allow to these colleges competent maintenance for learned men to teach there." Further Dell suggests that school and college education should not be entirely bookish. "Youth should spend some part of the day in learning or study, and the other part in some lawful calling, or one day in study and another in business."

F. W.

**DELSARTE.** -- Under this name a system of aesthetic and relaxing exercises has been promulgated in the United States, chiefly by Steele MacKaye, Genevieve Stebbins, Emily Bishop, and Anna Payson Call. The founder of the system was François Delsarte, a Frenchman, born at Solesme in 1811. At the age of twelve he was sent to Paris to study painting on china, but his tastes carried him in other directions, and he became, in 1825, a pupil of the conservatory, a government institution for instruction in acting, music, and the ballet. Here he lost his singing voice, and, finding himself incapacitated for the stage, he resigned that career to study and teach elocution and dramatic art. He developed what he termed the laws of aesthetic science. His chief idea was the expression of emotions through definite attitudes and movements of the different parts of the body. Delsarte attempted to classify and make scientific the empiric rules of the pantomime, for he believed that the perfect reproduction of the characteristic posture will produce the emotion depicted by the actor. He had particular positions and movements for fingers, hand, forearm, entire arm, head, torso, foot, lower leg, entire leg, entire body, eyelids, and lower jaw. Delsarte died in 1871, without having realized

his great ambition of revolutionizing dramatic expression. Delsarte, himself, made very little use of gymnastic movements, and then only to give his pupils perfect freedom of movement in gesture. "Delsarte's exercises were very few, very simple, and in no wise capable of developing the human organism in a physical sense, and certainly were not worthy the name of system. Delsarte aesthetic gymnastics is purely an American idea, first suggested by Steele MacKaye, and brought to its present stage of perfection by Americans." (Stebbins.)

The American Delsarte system of physical culture is based on three principles: (1) relaxation, or ability to rest, (2) energizing, and (3) deep breathing, principles which have been accepted in all schemes of physical training on the basis of well-known physiological laws, but without resort to the fanciful and meaningless expressions employed by the advocates of Delsarte, such as "the higher dynamic qualities of air," "the storage of oxygen within the cell walls of the lungs is a mystic force," "dynamic breathing, the pivot of all culture." In its Americanized form the Delsarte method was popular for a time in schools for young ladies and in society, but it occupies a very small place in modern scientific physical education. G. L. M.

**DELUSION.** — In general a delusion may be defined as a false belief, not directly and immediately dependent upon sensory stimulation as is an illusion (*q.v.*) or an hallucination (*q.v.*). While all false beliefs have been called delusions, only those should be thus designated which are of a more or less permanent and effective character and not consistent with the environment. The following criteria must be satisfied in order that a false belief be properly called a delusion. (1) The belief must be opposed to the experience and beliefs of the great majority of those associated with the believer; *i.e.* the belief is wrong and not true to the known facts. (2) The belief cannot be corrected when there are brought to the individual's attention other recognized and believed facts inconsistent with the special belief; *i.e.* the belief is not changed when suitable and appropriate arguments are brought forward. (3) The belief brings about definite types of action based upon it, often opposed to the well-being or to the good of the people in the environment. For example, the childish belief that the moon is made of green cheese or that of the adult that the sun revolves around the earth are false beliefs, but they are usually ineffective and not necessarily inconsistent with

previous education and with the environment. They are, therefore, not called delusions except in a popular way. The belief in the possession of great wealth is a delusion if it is inconsistent with the knowledge of other individuals in the immediate environment; if, for example, the believer is in rags and can produce no money or get no credit for the purchase of better clothing of which he appreciates the need, or if he attempts to make purchases out of proportion to his actual means and needs. The belief of the uneducated negro in voodoo or of the uneducated white in good and bad fairies, on the other hand, may lead to definite and suitable actions and may not be removed by an appeal to reason, but so long as these beliefs are consistent with their education and with the ideas of their fellows they are called false beliefs and not delusions.

Delusions are classed as follows: (a) fixed, when they persist for long periods; (b) changeable, when they remain for only a short time or give way to another idea of a delusional character; (c) systematized, when they are brought into relation with all other life conditions; and (d) unsystematized, when the relational element is not marked. According to Wernicke all ideas may be classed in one or more of the following ways: Those relating to the external world; those relating to the body; and those relating to the mental self or to the mind. Delusions may arise in any or all of these spheres which are called, respectively, allopsychic, somatopsychic, and autopsychic. This is the best classification of delusions, and it may be well to give examples of each of these. Allopsychic: being persecuted, or poisoned, or called names; somatopsychic: having no body, or no limbs, being pregnant, having animals in the abdominal cavity; autopsychic: being royalty, God, or Christ, or a great inventor, or having committed the unpardonable sin. Often the delusion is of a mixed character, and applies to two or all three spheres.

It has previously been said that the delusions are not based upon sensory elements, but it may now be remarked that some of the delusions undoubtedly originate in some form of sensory stimulation, usually of the character of a paræsthesia. Some delusions are explainable on the ground of perceptual disorder, and they are, therefore, allied to hallucinations, but in many cases the sensational or perceptual element is not evident. It appears likely that all of the somatopsychic and most of the allopsychic delusions are based upon changes in the character of sensations, and in this connection special interest attaches to the little-understood afferent impulses mediated through the sympathetic nervous system. **DEMENTIA.**—A general term referring to certain forms of insanity which are not accurately definable in specific mental terms, but which in a general way may be said to be a more or less permanent deterioration or breakdown of the normal mental capacity. The term is not so broad as and is not synonymous with insanity (*q.v.*), nor with feeble-mindedness. The word is intended to describe the decrease in ability to meet social and other conditions, taking as the basis of comparison the ability which was normal for the individual. In this sense it is and may properly be used of the feeble-minded (especially of the high-grade imbeciles or the so-called cases of psychopathic inferiority) who had advanced to a certain point and then deteriorated.

(1) The form of dementia best known to non-medical people is that found in the aged, in whom there is a gradual bodily and mental enfeeblement, so that in the last stages the individual becomes like a young child and must be taken care of in the same manner as is an infant. The marks of this condition are defects of memory and inability to respond to new stimuli, on the one hand, and the recall of certain facts of early life on the other. Lack of judgment and defective memory are accompanied by irritability, egotism, and delusions, with occasional epileptiform attacks and paralyzes (*q.v.*).

(2) Arterio-sclerotic dementia is dependent on hardening of the arteries and the consequent interference with the cerebral circulation, and may appear at any age after middle life.

(3) The mental state in *dementia paralytica*, general paralysis of the insane, or paresis (*q.v.*), resembles to a marked degree that in senile dementia, but it occurs usually in those of middle life and always on the basis of a previous syphilitic infection.

(4) To the educator the dementia beginning at or about the age of puberty is of much more interest and importance. (See article on ADOLESCENCE.) This is the form of insanity called by Kraepelin *dementia præcox* (*præcox* = "preocious" or "early"). This disease is insidious and progressive, and it seems to depend upon certain maladjustments to the environment. For example, the history of a patient shows that when young he did not play well with his companions, that he preferred to be alone, that he showed a lack of interest in many things that boys delight in, and that many occurrences of a usually emotional character did not affect him. In contradistinction to this, it is often found that he was a better student than his fellows, and perhaps had been extraordinarily bright. In succeeding years the abnormal characteristics become exaggerated, new ones are added, and then a typical picture of beginning dementia is seen. The exhibition of rather definite characteristics enables the psychiatrist to divide these patients into three classes:—

(a) *Hebephrenic*. In the early stages of hebe-

phrenia the mental condition of a patient does not differ essentially from those in patients with catatonic and paranoid dementia precox. At a certain stage, the date depending upon unknown factors, there is usually an abrupt mental change. The individual becomes depressed; hallucinations, usually of an auditory character, develop, and from the hallucinations, or even independently of them, delusions arise. The attention is weak, and most of the time the patient gives no heed to what is going on about him. Very often the hallucinations are of voices saying unpleasant and disgusting things. At first the patient is usually depressed, and the delusions are such as comport with the feeling tone. Later the delusions change, and are usually shallow and fleeting. If the patient talks, it becomes evident that there is a poverty of ideas and that his ideas are loosely strung together. Mannerisms are often shown, an echolalia or a mild form of catalepsy (*q.v.*). Added to these is an emotional deterioration, evidenced by the inadequacy of bodily reactions as compared with the vocal expression of emotion-producing (*i.e.* productive of emotion in a normal person) ideas. In the later stages the dementia becomes more marked, and expressed ideas are confused and incoherent. At times speech becomes a "word salad," in which words are joined to make sentences which have no meaning to normal people.

(b) *Catatonic.* On account of the gradual onset it is difficult to set a date for the beginning of the catatonic form of dementia precox. All one can usually say is that the early symptoms of maladjustment become gradually exaggerated, and eventually develop into a stuporous or into an excited state. Throughout the course of the disease these two states continue and may alternate. If the patient becomes stuporous, he lies or sits or stands in one place and shows little or no reaction to any form of stimulus. Sometimes the body is tense and rigid; attempts to move its parts are met by opposing movements of the patient (negativism); sometimes the opposite condition of catalepsy (*q.v.*) or *flexibilitas cerea* is present, and an increased suggestibility is shown in other ways: in speech by the repetition of phrases heard by the patient (echolalia); in movement by the repetition of movements which he has seen (echopraxia). An excited stage may be present in which there is motor unrest and a marked flow of speech. However, the movements are usually aimless and speech is incoherent, although both of these activities appear at first glance to have a marked resemblance to those in simple mania (*q.v.*). Occasionally a veritable rage occurs, in which the patient bites himself, flings himself about, dashes his head against the wall, etc.

(c) *Paranoic.* The paranoic form resembles paranoia (*q.v.*), in the presence of fixed ideas, delusions of grandeur or of persecution. It differs from true paranoia in that it leads to a

mental deterioration, while paranoia does not lead to this condition, unless the presence of delusions may be said to be an evidence of dementia. In addition, hallucinations, emotional deterioration, depressions and excitements, and mild cataleptic symptoms, or exaggerated suggestibility may be present.

A remission or a return to an approximate normal condition is seen in a small percentage of these cases, but it is doubtful whether a complete mental restitution ever takes place. Not sufficient is known about prophylaxis in these cases, but comparisons of large numbers of these patients indicate that early recognition and prompt treatment retard to a great extent the appearance of profound dementia. According to Kraepelin's statistics, about one seventh of all admissions to insane hospitals are cases of dementia precox. When we bear in mind that this is a disease of long duration, and that most other mental diseases are comparatively short, it can be understood that about one third of all inmates of insane hospitals are of this class. About two thirds of all these cases show sufficiently marked abnormal traits to be committed to hospitals before the age of twenty-five. The latter fact, in conjunction with the statistical evidence regarding the value of early treatment, indicates plainly the importance of a knowledge of the general symptomatology of the disease by those interested in educational problems. DEMOCRACY AND EDUCATION. — The connection of education and democracy may be viewed in two ways. On the one hand, democracy requires for its perpetuation a more widespread education of the members of the state

than does an oligarchic or aristocratic state. Since all the voting citizens are in theory, and to some extent in practice, the rulers of the state, they must be educated if legislation and administration are to be sound, orderly, and progressive. On this account the entire modern movement in education for common, or public, schools supported by taxation with attendance more or less compulsory is closely connected with the democratic extension of suffrage and civil responsibilities. In distinction from this political and more external relation of democracy to education stands the part that democratic ideals play in the constitution and conduct of the school itself, whether as respects its methods of government and enforcing order, or methods of teaching and the subject matter of the curriculum. Democracy inevitably carries with it increased respect for the individual as an individual, greater opportunity for freedom, independence and initiative in conduct and thought, and correspondingly increased demand for fraternal regard and for self-imposed and voluntarily borne responsibilities. Insensibly, rather than consciously, the atmosphere characteristic of democracy penetrates school methods and materials and modifies educational ideals.

**DEMONOLOGY.** — In the effort to explain the facts of nature under the categories of personality primitive man developed belief in a great variety of spirits or demons who inhabit natural objects of all types. These demons were controlled by incantations and devices, which when thoroughly understood and formulated constituted a supposed body of knowledge designated demonology. The demon is not at first regarded as malign.

See MYTHOLOGY; SOCIAL PSYCHOLOGY.

**DEMONSTRATION.** — In its literal and etymological sense, demonstration means showing something to be thus and so, pointing to an object that exists or an event that occurs so as to induce perception of it. In this sense lectures in anatomy demonstrate the structure of the human body, or a lecture in physics demonstrates some fact by performing an experiment. In a technical logical sense, demonstration is equivalent to proof. Proof, however, has a wider and a narrower (stricter)

sense. In its broad sense, to prove is to try, to test; and any proposition is said to be proved in the degree in which it emerges successfully from such experimental or logical tests as may be applied. In its stricter sense, demonstration means conclusions that follow with rigid necessity from premises which are themselves regarded as necessary truths, or which are derived from such self-evident truths. Since axioms, rigid definitions, and consistent rules of operation are necessary to demonstration in this sense, the mathematical sciences are alone strictly demonstrative. The three senses indicated taken in the order given cover the evolution of demonstration in educational practice. In any new subject, all that is required at first is to make out the topic clearly, to show it forth,—demonstration is psychological rather than logical. And in most topics persuasion and thorough belief attend upon clear familiarity rather than upon seeing the logical dependence of conclusion upon premise. Then come certain operations of testing, of checking and corroborating, and finally efforts at a deductive, or logically rigid, system. To attempt this type of demonstration at the outset is always a mistake.

J. D.

**DEMONSTRATION, METHOD OF.** —

One of the objective methods of presentation in teaching in which the instructor himself conducts the experiment, dissection, examination, etc., in the presence of the class. The method of demonstration is frequently used when the laboratory method, in which each student conducts the work himself, is not feasible. It is much used in the natural sciences and in medical instruction. It is applicable in almost any subject where objective teaching is needed.

See LABORATORY METHODS; OBJECTIVE METHODS.

**DEMONSTRATION SCHOOL.** —

A term introduced by Professor J. J. Findlay for the school for observation, demonstration, experiment, research, and practice attached to departments of education in universities performing the same function as hospitals, laboratories, apparatus, libraries, and field work in other departments of study. In the demonstration school the theoretical lecture of the classroom finds its realization in practice. The term as adopted and used by the English Board of Education hardly differs from the ordinary practice school.

**DE MORGAN, AUGUSTUS (1806-1871).** — A well-known English writer on mathematics.

He was born at Madura, India, in 1806, and died in London, in 1871. He entered Trinity College, Cambridge, in 1823, and was graduated as fourth wrangler in 1827. He early showed considerable mathematical ability, but never concentrated his attention sufficiently upon any one subject to win for himself a high position as an original mathematician. He was the first professor of mathematics in University College, London, having been elected in 1828. He resigned the chair in 1831 as a protest against the action of the authorities in dismissing a colleague without assigning their reasons, but was reelected to the same position in 1836, and held the chair until 1866, when he resigned.

De Morgan was a great bibliophile, and his collection of early mathematical works was extensive. His library was purchased after his death by Lord Overstone, and was presented to the Goldsmith's Society, and by it was deposited in the University of London, where it now remains. De Morgan was an indefatigable worker, and was connected with various important societies, in particular the Astronomical Society, the Society for the Diffusion of Useful Knowledge, and the London Mathematical Society. He contributed many articles on the history, theory, and teaching of mathematics, to the *Penny Cyclopaedia* and the *Companion to the British Almanac*. His best-known works include the following: *Essay on Probabilities* (1838), *Arithmetical Books* (1847), *Formal Logic* (1847), *Trigonometry and Double Algebra* (1849), and various textbooks and monographs. His textbooks are characterized by an eccentric form of learning that renders them very helpful to teachers, but unprofitable types to be followed by textbook writers.

His son, George Campbell de Morgan, gave much promise as a mathematician, but he died in 1867. His widow wrote a *Memoir* of her husband which was published in 1882.

D. E. S.

**DEMOTION.** — A term sometimes used to signify the opposite of promotion. It designates the placing of a pupil in a class below that in which he happens to be, and with which he is unable to keep pace.

See GRADING AND PROMOTION.

**DENDRITE.** — All of the highly organized nerve cells are supplied with branches through which stimuli may enter the nerve cell. These branches which lead into the nerve cell are short as contrasted with the long fiber which leads out of the cell. The short branches are also supplied with many minor rootlets, and the whole branching structure is known as a dendrite. The dendrites are of great significance in the organization of the nervous system, because they constitute definite paths along which nervous impulses may travel. In early stages of embryonic life the cells are not supplied with dendrites; and the dendrites of the higher ani-

mals are much more complex in structure than the dendrites of the lower animals. The interlacing of dendrites with the dendrites of other nerve cells and with the terminations of the longer nerve fibers constitute the most important points of organization in the nervous system.

See SYNAPSE.

**DENISON UNIVERSITY, GRANVILLE, OHIO.** — A coeducational institution founded in 1831 and controlled by the Baptists of Ohio. The plant includes fourteen buildings used for purposes of instruction and dormitories. The university includes Granville College for men and Shephardson College for women, Doane Academy, Shephardson Preparatory Department, a conservatory of music, and a school of art. Students are admitted on certificates from approved high schools or by entrance examinations requiring fifteen units without condition. Three degrees are conferred on the completion of the college course: Bachelor of Arts, Bachelor of Science, and Bachelor of Philosophy. There are fifteen professors, four assistant professors, and thirty instructors and assistants on the faculty.

**DENMARK, EDUCATION IN.** — Form of government, constitutional monarchy. Present constitution, with modifications, based upon charter of June 5, 1849. The right of making or amending laws is vested in the Rigsdag, acting in conjunction with the King. Area of Denmark 15,592 square miles; subdivided into eighteen counties, and these into sixty districts. Population in 1906, 2,588,919. Capital, Copenhagen; population, 426,540. State religion, Evangelical Lutheran.

**Educational History.** — The early history of education in Denmark is similar to that of central Europe as a whole. It begins when Christianity spread into the country and schools were established by the religious orders of the Benedictines (*q.v.*) and Dominicans (*q.v.*) for the purpose of gaining converts and recruiting the ministry. Cathedral and convent schools (*q.v.*) were established in the latter part of the tenth century. Latin schools existed in the larger towns in the twelfth century. The University of Copenhagen (*q.v.*), founded by virtue of a Bull issued by Pope Sixtus IV, was opened in 1479, with three tutors, one in theology, one in law, and one in medicine.

The Protestant Reformation (sixteenth century) found firm support in the Danish sovereigns, and schools and Bible teaching, following the injunctions of Luther, were fostered by their direct efforts. Under these new impulses

the former Latin schools were organized in two grades, higher and lower, both of which were under the supervision of the Lutheran clergy. The municipal authorities of some of the towns established writing schools (*q.v.*) for the poorer classes. Little attention, however, was given to schools in the country. Where there were such, the buildings were poor, and the teacher was obliged to engage in some other work for a part of the year. Under the watchful care of the clergy, the catechism (*q.v.*) was taught to most of the children. King Frederick IV (1699-1730) endeavored to increase and improve the provision for popular instruction. He gave orders for the building of 240 school-houses, twenty in each of the twelve districts, each house consisting of a schoolroom and dwelling for the teacher. The schools were regulated and the salaries of the teachers fixed by royal decree of 1721. By this decree, children between the ages of five and eight years were required to attend school daily for five or six hours; after the age of eight they must attend for half of each school day. Religious instruction and reading were made obligatory, while arithmetic and writing were optional studies. During the reign of Christian VI (1730-1746), the schools were reorganized and more importance was attached to public instruction. Parish schools were established in all the towns, and in the larger villages (1739). In order to provide sufficient funds for the lower grade schools, some of the higher Latin schools were closed. The subjects of primary instruction were those previously fixed for public schools. Further efforts were made during the eighteenth century to improve and extend the system of instruction, but on account of the poverty of the peasant class, and non-support of the wealthier class, little was accomplished.

Toward the close of the eighteenth century the ideas of Rousseau and Basedow created a new interest in education, the practical effects of which were realized when the schools founded by Roehow (*q.v.*) in Re Kahn (Germany) became models for Danish primary schools. A more important result of this awakening was the appointment in 1789 of the High Commission of Schools, charged with the reorganization of the entire school system. The recommendations of this body were made the basis of new school laws, which went into effect in 1814. They required that the expenses of the primary schools should be borne by the communes; provided for the establishment of two-class elementary schools in such rural districts as could support them, and of two schools in each of the larger villages. Evening classes for adults were to be maintained in the larger towns. The laws also made school attendance compulsory for children between the ages of seven and fourteen. In the interests of economy, teachers in the villages and rural districts were authorized to act as churchwardens. This new era in education also gave birth to

the normal school. By royal decree of 1789 the first normal school had been established at Blaagaard, near Copenhagen; five more normal schools were established in different parts of the country when the law of 1814 went into effect. In 1799 a private school for gymnastic training was opened in Copenhagen; later this became a public institution for the training of teachers; and in 1828 gymnastics were introduced into all the schools of Denmark. The monitorial system (*q.v.*), or system of mutual instruction, was introduced into Denmark in 1824 by Captain J. Abrahamson, who had observed its effects in France and induced Frederick VI to permit its use in the schools of his kingdom. The method was extensively employed as late as 1841.

Up to this time Denmark had been affected mainly by currents of influence from other countries. But conditions within, during the period of social and political unrest which reached a crisis in the war with Germany (1848), were of such character as to develop and set free the native forces. In educational affairs these took the form of a demand for more practical instruction and at the same time a desire to increase the opportunities for education. As a result the Latin schools were transformed into Real schools (*q.v.*), *Realskoler*, and gymnasia, and a further movement, but of greater significance, was the foundation of the People's High Schools, *Folkkehjjskoler*, under the inspiring influence of Bishop Grundtvig, the poet, philosopher, and reformer of the Danish national movement. An incident of this general movement was the interest excited in the instruction of girls. The leader in this cause was Miss Natalie Zahle, who in 1851 opened a school to prepare young women for teaching. As a result schools for girls were soon established in all the larger towns. The cause of popular education was thwarted for a time by the final struggle with Germany (1864). But the foundation had been laid, and the educational movement soon revived with full vigor. Since that time there have been no noteworthy changes in the general character of the different classes of schools, but there has been gradual improvement along lines already marked out, with a general movement toward a unified system.

**Present System.** — *Control of Schools.* — Danish schools have always been closely associated with the Church. Throughout the long history from their incipency, when they were supported by the Church and entirely under its control, until the present time, when church control is merely nominal, the movement toward secularization has been gradual. For this reason, religious instruction has always been given an important place in the curriculum. But the system of instruction has profited by the nurture of the Church. The clergy were the first teachers, and continued to care for the rural population as long as there were no free public schools. The Reformation caused no

upheaval in school and Church, as in other countries, consequently no interregnum in their services. At present both the bishops and clergy serve as members of school committees, *ex officio*, and aid in the selection of teachers and the administration of the schools.

Apart from this relation to the Church, school affairs in Denmark are under the supervision of the civil authorities. The control of the system is vested in the Minister of Ecclesiastical Affairs and Public Instruction, who has supervision of all schools, including the university; but certain rights are delegated to the local authorities. The principal duties of the minister in regard to education, are to inspect and regulate schools, gather statistics, and apportion the school fund. For purposes of local administration each county has its school council, or *Skoleraad*, whose duties pertain

largely to the finances of the schools; each district of the county has its school board or *Skole-direction*, who appoint the teachers, arrange the course of study, and aid in the selection of books; each commune and each village has its school commission, *Skole-commission*, which looks after the interests of the individual school. For inspection of secondary and higher schools the Minister of Ecclesiastical Affairs and Education is assisted by special inspectors and the bishops of the Church.

The lack of close connection between the primary schools and secondary schools led to the enactment of a new law (1903), the object of which is to base secondary education on primary education and to coördinate all the schools, from the lowest to the university, in one system.

The school system as thus organized consists of the *Folkeskole*, or elementary school, compulsory age for attendance from seven to fourteen; the *Mellem skole*, or middle school, consisting of a four-year course, and a three-year gymnasium course which prepares for the university. After the eleventh year children may pass from the elementary school into the mid-

dle school. The organization of the school system is indicated in the above diagram.

*Primary Education.* — Primary instruction in Denmark is free to all classes of people, and all receive the elements of knowledge at least. There is practically no illiteracy. The system as a whole is similar to that of other countries of Europe, excepting for an unusual degree of local independence, and, as a consequence, more freedom in regard to the conduct of the individual school. The present school law is based on the law of 1811; and public elementary instruction, which was made obligatory for all children between the ages of seven and fourteen, may be said to date from that year. Until recently, however, the entire burden of the schools fell on the local authorities, and they often found it difficult to pay the salaries of the teachers, and consequently to maintain a school. In 1878 the State made appropriations for public schools, and has ever since devoted increasing amounts toward the salaries of teachers. The primary school is divided into three grades: the first or preparatory for children from seven to ten years; the second for children from ten to twelve years; the third for children from twelve to fourteen years. If the number of children in a school is not above thirty-five (thirty-seven in the country), the three grades may be taught together as one class; if more than thirty-five, the grades must be taught separately. Most of the rural schools have more than thirty-five pupils, hence have from two to three separate grades. The city schools have from six to eight grades. In the thinly populated districts the boys and girls attend the same school; but in thickly settled districts there are separate schools for the two sexes. The average number of pupils in the state primary schools of the country is 65; in the state primary schools of the towns is 390; while the average for the state primary schools of Copenhagen is 1280. In regard to the choice of textbooks there has always been much freedom. The textbook for religious instruction must be one approved by the Minister, and the courses in music and gymnastics are officially outlined; as to the other textbooks, the choice rests with the teacher and the local school authorities. The course of study for the three grades, and the number of hours per week for each subject, are as follows: —

	1	2	3
Religion . . . . .	4	3	3
Danish Writing } . . . . .	9	8	8
Arithmetic . . . . .	5	3	3
History Object Lessons } . . . . .	2	3	3
Geography Natural Science }			
Singing . . . . .	1	1	1
Total . . . . .	18	18	18

The minimum number of hours of instruction is eighteen per week in the country, besides gymnastics, sloyd, and hygiene, or needlework for the girls; and twenty-one hours in the towns besides the above-named subjects and domestic economy for girls. In addition, mathematics and a foreign language may be taught in the town schools. The minimum length of the school term is 240 days of six hours each. The average cost of the public elementary schools of Denmark for the years 1900-1905 was 12,970,599 kr. (\$3,476,121) (1 krone = 26.8 cents gold, of which amount the State gave 1,600,000 kr. (\$428,800). The state aid for primary instruction for 1906-1907 was 2,930,000 kr. (\$785,240). The average cost per individual (1900-1905) for primary instruction was 5.20 kr. a year, or slightly above \$1.39. The total number of children of obligatory age in school, in 1905, was 392,930; to this number may be added 16,092 children under seven years of age in private schools and lycées, making a total of 409,022 receiving primary instruction.

*Teachers' Training Schools.*—The teachers of the primary schools are educated in the normal training schools, of which there are four public and fifteen private having a three-year course, and one public and three private, having a one-year course. The latter schools are for teachers of the first grade (7-10 years) of the primary schools. The four public normal schools are for men, and the fifteen private schools are about evenly divided between the sexes, a number of them being coeducational. To enter the state normal schools the applicant must be at least eighteen years of age and must have taught one year. The preparatory year of teaching is usually passed in some private school. The course of study for normal schools includes religious instruction, pedagogy, Danish language, history, geography, zoölogy with botany and a little geology, physics, mathematics, writing, singing, violin and organ, gymnastics, and manual training. A teachers' high school, open to both sexes, has been established for the further instruction of primary teachers. This school affords opportunity for specializing by offering courses for either a six-months' or a year's term of study. For either period there is a wide range of subjects from which to select. The tuition at the state normal schools is 40 kr. (\$10.72) a year, and the entire expenses for the year about 340 kr. (\$91.12). The tuition at the private normal schools is about 150 kr. (\$40.20) a year. In 1906 there were 241 men and 149 women attending the state normal schools. The *Pedagogiske Selskab*, a teachers' association, organized in 1820 for the discussion of educational questions, has been of service to many teachers, and has also had great influence in shaping educational affairs.

*Salaries and Pensions.*—The amount of salary the teacher receives depends upon the importance of the position, whether in town or

country, and also varies with the length of service. The men receive their maximum salary after twenty years' service, the women after twelve years' service. For the country the maximum salary ranges from 800 kr. for a first-grade (children from seven to ten) teacher to 1600 kr. for a head teacher, while in the larger towns the maximum salary ranges from 1500 kr. for a woman to 3600 kr. for a head teacher. Teachers in the country under permanent appointment have free residence, fuel, and a small piece of land for cultivation. In order to obtain a fixed position and consequently a free residence, the teacher must pass the regular teacher's examination, must profess the doctrines of the Lutheran Church, must be at least twenty-five years of age, and have had four years' successful experience in teaching. As employees of the State, teachers acquire the right to a pension after five years' service. The maximum pension allowance, which amounts to about two thirds of the salary, is received after thirty years' service. In granting the maximum pension the experience in teaching previous to the age of thirty is not recognized. The State appropriates for pensions about \$50,000 kr. (\$227,800) a year.

*People's High Schools (Folkhøjskoler).*—Few countries offer such opportunities for continuation study beyond the elementary schools as Denmark. This has been made possible by the establishment of people's high schools which have for their object the enlightenment of the peasant and agricultural classes. These institutions are unlike secondary schools, are original with the Danish people, and, in so far as they differ from other schools, form a distinctive contribution to educational methods. They were founded on the pedagogical ideas of Bishop Grundtvig (*qr*), who believed that the individual derived most benefit from instruction between the ages of eighteen and twenty-five; that history and religion fill the mind with new and inspiring ideals; and that the individual also should have special training in the practical matters which may aid him to improve his living conditions. Consequently, while there is great freedom in the choice of subjects taught in the schools, history and religion are given prominent places for their inspirational value. Apart from these two leading subjects, the student has the opportunity to select from the wide range of subjects those of immediate utility to himself. The first of the people's high schools was opened at Rödning in 1844, and in 1864 was moved to Askov. This institution has become the centre of the whole movement and attracts students not only from Denmark, but from Iceland, Finland, the Faroe Islands and the United States. Their purposes and methods met with popular favor, and the number of schools has gradually increased until now there are seventy, besides fourteen agricultural schools organized in a similar manner. Other Scandinavian countries adopted the system, and Danish

colonies in America carried the idea thither. The schools are intended for adults from eighteen to thirty years of age. There is entire freedom in respect to the choice of subjects, appointment of teachers, and method of instruction. In some cases stress is placed upon science; in others upon technical subjects. There are no entrance or leaving examinations. Instruction is given almost entirely by lecture, and includes history, religion, Danish language and literature, mathematics, science, singing, gymnastics, and practical subjects, the last named relating as a rule to agriculture and farm life in general.

tunities for continuation study in the evening schools scattered throughout the country. In these schools there are about 20,000 pupils. There are also evening schools in the cities, having about 3000 pupils.

*Secondary Schools.*—The Danish secondary schools are characterized by the thorough, careful training common to this class of schools in central Europe. Their history is that of the reorganization and development of the Latin schools which have existed in Denmark since the twelfth century. At the beginning of the nineteenth century the number of secondary schools for boys in Copenhagen was twenty-two, with 1206 students; outside of Copenhagen there were eleven schools, with 249 students. Secondary education was modernized in 1809, when the sciences were given a more important place, and again reorganized in 1850 by the establishment of *Realskoler* and gymnasias. The gymnasium prepared for the university, the *Realskoler* for business or for the middle professional schools (industrial, technical, and commercial). Hence the establishment of the *Realskoler* was a decided step toward making instruction practical, and was a part of the larger movement in Denmark in behalf of popular education. The two classes of schools were both outgrowths of the old Latin schools, and consequently were often conducted in the same building and by the same faculty. The age for admission was the same in both cases, i.e. twelve years. The gymnasium had a six-year course of study, and the *Realskoler* a course of four years. The work of the latter school was completed by the *Realexamen*, the leaving examination, which was accepted as an entrance standard for middle professional schools. This dual system was continued with few modifications until 1903; but the relation between secondary and primary schools was not satisfactory. Each class of schools was conducted independently of the other, and the primary pupil was not always prepared to enter the secondary school. As a consequence of these defects, the whole system was reorganized, and a new class of schools established, the *Mellemkoler*, or middle schools, which, as the title suggests, form a link between the formerly separate parts of the system of public instruction. The *Mellemkole* offers a four-year course, to which is added an extra year for those who desire to prepare for the *Realexamen*. The gymnasium offers a three-year course, for which the pupil is prepared by the *Mellemkoler*.

The secondary schools are now passing through a transition state, and hence any statements as to the number of the different classes of schools is of temporary value only. Previous to the last reorganization there were 165 *Realskoler*, thirty-three of which were in connection with Latin schools. The number of gymnasias remains the same, namely, fourteen state and four communal or town gymnasias. With these may properly be included sixteen "rec-

Map of Denmark with location of People's High Schools (○) and Schools of Agriculture (●).

Instruction in the last branch is now given in specific technical schools which sprang out of and are conducted in the same spirit as the high schools, which students usually attend before specializing. The schools are usually held for two terms a year, a five months' term during the winter months for men, and a three months' term during the summer for women. The cost of tuition for the longer term is 50 kr., and the entire expenses, including cost of living for the five months' term, about 162 kr.; for the three months' term about 102 kr. The number of students in 1907 was 3273 men and 3266 women; the agricultural high schools registered 1131 men and 108 women. The state aid to the schools for 1906 was 433,000 kr. (8116,044); of this sum 252,000 kr. was used to help defray the expenses of needy students.

*Other Continuation Schools.*—Beside the people's high schools, there are other oppor-

ognized" private schools. In order to be "recognized" a school must give evidence of permanency as an institution, and must have been in existence long enough for the teachers to prove that they can prepare pupils for the leaving examination of the class of schools to which it belongs. The privilege of having students admitted to this final examination is granted by the State, and is a guarantee of efficiency. Private schools that maintain this standing usually receive a grant from the State. For the *Realskoler* the State required that in addition to obtaining the examination right, they should enroll a specified number of pupils, should maintain a certain scale of salaries and a fund for teachers' pensions; it was also stipulated that the local authorities should contribute one fourth the amount given by the State.

Secondary schools for girls are not so numerous as those for boys, are comparatively small, and are not aided by the State. There are, however, schools for girls in all the cities and larger towns. Some of them prepare their students for the same examinations as are prescribed for the gymnasia and *Realskoler*. The law of 1903 opened the doors of most of the state schools to girls, thus virtually creating a new era in secondary education.

For all secondary schools the recitation period is fifty minutes, and the number of periods must not exceed thirty per week. The course of study for the *Mellemskole*, and the weekly program showing the time given to each subject, is as follows:—

SUBJECT	NUMBER OF HOURS A WEEK			
	First year	Second year	Third year	Fourth year
Religion . . . . .	2	2	2	1
Danish . . . . .	5	4	4	5
English . . . . .	6	3	3	3
German . . . . .	3	5	4	4
History . . . . .	3	2	3	2
Geography . . . . .	2	2	2	2
Biology . . . . .	2	2	2	2
Natural Science . . . . .	2	2	2	2
Arithmetic and Mathematics . . . . .	4	5	6	7
Writing . . . . .	2	1	1	1
Drawing . . . . .	2	2	1	1
Gymnastics . . . . .	1	4	4	4
Singing . . . . .	2	2	1	
Total number of hours . . . . .	36	36	35	34

The course of study for the extra year or *Realklasse* includes: Danish, four hours; commercial arithmetic, four hours; two foreign languages, eight hours; history and science, eight hours; optional, six hours; total thirty hours per week. Girls are allowed to omit commercial arithmetic and take optional studies instead.

The gymnasium offers three different courses of instruction: the classical, the modern language, and the mathematical-scientific. The subjects of study and number of hours a week are as follows:—

SUBJECTS	CLASSICAL COURSE			MODERN LANGUAGE COURSE			MATHEMATICAL-SCIENTIFIC COURSE		
	Hours a week			Hours a week			Hours a week		
	1st yr.	2d yr.	3d yr.	1st yr.	2d yr.	3d yr.	1st yr.	2d yr.	3d yr.
Religion . . . . .	1	1	1	1	1	1	1	1	1
Danish . . . . .	4	4	4	4	4	4	4	4	4
History . . . . .	3	3	4	3	3	4	3	3	4
Greek . . . . .	6	6	6						
Latin . . . . .	6	5	5	4	4	3			
English <sup>1</sup> . . . . .	2	2	2	5	5	5	2	2	2
German . . . . .				4	4	4			
French . . . . .	4	4	4	4	4	4	4	4	4
Archæology . . . . .		1		1	1	1	1	1	1
Geography <sup>2</sup> . . . . .	2	2	2	2	2	2	3	3	2
Biology . . . . .									
Natural science . . . . .							6	6	6
Mathematics . . . . .	2	2	2	2	2	2	6	6	6
Gymnastics, Singing or Physical labor . . . . .	6	6	6	6	6	6	6	6	6
Total . . . . .	63	36	36	36	36	36	36	36	36

The number of pupils attending the "recognized" secondary schools in 1905 was as follows: *Realskoler*, boys, 15,261; girls, 11,137; Latin schools, boys, 1011; girls, 91. No official report has been given of the number attending unrecognized Latin schools. The tuition in the *Mellemskoler* is 120 kr. a year, and in the *Realklasse* and gymnasia 144 kr. a year. The state expenditure in 1906 for state schools was 475,000 kr. (\$127,300), while grants to other secondary schools amounted to 109,000 kr. (\$29,212).

The teachers in the state secondary schools are educated at the university. Having completed the academic work, they take the examination for secondary school teachers, then special pedagogical training, and, finally, practice teaching in some school approved by the university authorities. The number of teachers in 1906 was about 1650. The maximum salaries range from 2400 kr. for assistant teachers to 5000 kr. for principals. Residence is also provided for the principal. There are associations of the teachers of both the boys' schools and the girls' schools.

Summer vacation begins the eighth of July and lasts six weeks, and the total number of holidays, including vacation, must not exceed sixty-three school days.

*The Schools of the Capital.*—The seat of the university, of the royal library, the Classen library, and other institutions devoted to science and art, Copenhagen is naturally the center of the intellectual life of the kingdom. Its schools present the highest development of the general system of education, and the educational principles and methods approved by the experience of the capital city are rapidly followed, not only in other cities, but in rural

<sup>1</sup> Either English or German for classical and mathematical-scientific courses.

<sup>2</sup> Two hours a week for geography, biology, and natural science in the classical and modern language courses, and the hours indicated for geography and biology in the mathematical-scientific course.

schools as well. Hence the universal attention paid to the health and physical development of the young. Gymnastics form an important part of all school programs, and Copenhagen has fifty well-appointed gymnasiums belonging to the elementary schools. The service of medical and dental inspection has extended from the capital to all the cities of Denmark, and the provision of school baths is rapidly spreading. The care of the children does not end with the annual school term; summer colonies are maintained in the suburbs of nearly all the cities, to which children of the poor are sent for periods of refreshment.

The secondary schools of Copenhagen are well organized and maintain high standards. For girls private schools are preferred, but coeducation has been introduced with success in several public secondary schools. The programs in that case may be extended in time to lighten the work for girls. In 1907 a special examination for girls' schools was instituted, corresponding to the *Mellemskollevamen* and the *Realexamen*. Candidates for these examinations must be at least seventeen years of age, and schools wishing to have the right to prepare for the same must comprise at least six progressive classes.

*The University and Professional Schools.*—The higher institutions of learning in Denmark comprise the University of Copenhagen, the Institute of Technology, dental and pharmaceutical institutes, school of agriculture, and professional schools. First in rank of these institutions is the university, founded in 1475 by King Christian I. An intimate relation was maintained with Cologne, whence many of the early professors were drawn. The university was reorganized in 1539 under the direction of Johann Bugenhagen (*q.v.*), when Denmark turned to Lutheranism. In 1732 King Christian VI restored the university, which had been destroyed by fire three years earlier. In 1780 the scope of the university was enlarged, and the main features of the present organization date from that time. The university buildings are of comparatively recent construction, the old structure having been destroyed at the bombardment of the city in 1807. Under the direction of the university, or forming organic parts of it, are the hygienic, medical, and historical laboratories; the anatomical, mineralogical and zoological museums; the astronomical observatory, and the botanical gardens. The university, although under the general supervision of the Minister of Ecclesiastical Affairs and Public Instruction, enjoys a high degree of autonomy. The internal administration is vested in a university council (*Konsistorium*) consisting of sixteen members, including representatives of each of the faculties. The professors are appointed by the King upon the recommendation of the minister in advice with a committee of the university; they rank in the third class of the social hierarchy. The salaries range from 3600 kr. for assistant, to 6000 kr. for full professors.

There are at present five faculties, as follows: theology, with five professors; law and political science, with eight professors; medicine, with fourteen professors; philosophy, with fifteen professors; and mathematics and natural science with eleven professors. Instruction is open to any one prepared to meet the entrance requirements, but the work is intended primarily for those who have passed through the Danish secondary schools. For the benefit of these students more than one hundred scholarships are offered. The number of students for 1906-1907 was: men, 1106, women, 59. The numbers for each faculty, as inferred from the entrance examinations, were as follows: theology, 34; law, 27; medicine, 48; philosophy, 435; mathematics and natural science, 602; graduate students, 19. As a center of scientific research the university enjoys high repute, and many important investigations are carried on by the professors. The discoveries of Meyer in medicine, Thomsen and Petersen in archaeology, Lorenz in physics, and Thomsen in chemistry are noteworthy. Professors Höfding and Brandes of the present corps have gained wide recognition; the former by reason of his contributions to psychology and aesthetics, and the latter for his brilliant style and discriminating literary criticism.

*Polytechnical Institute.*—Scarcely inferior in rank to the university is the Polytechnical Institute. Established in 1829 with seven teachers for the training of chemists and mechanics, the school has grown and expanded until it includes all the courses usually given in the advanced schools of technology. There are twenty-four professors in the faculty, and a student body of about 550.

*Professional Schools.*—The dental and pharmaceutical institutes have about 200 students; the veterinary and agricultural high school over 500 students; schools of agriculture and gardening about 1200 students; the academy of fine arts, 200 students; conservatory of music, about 100 students; and the navigation schools, 175 students. Besides these there are a number of commercial schools of different grades, enrolling 4000 students.

*Education of the Defective Classes.*—The education of the blind, the deaf, and the feeble-minded is under the supervision of the Minister of Ecclesiastical Affairs and Public Instruction. The success of the French schools for the blind and for deaf-mutes in the beginning of the nineteenth century awakened interest in Denmark; and in 1807 the first school for the deaf was established by the State at Copenhagen and instruction was made obligatory for the children thus afflicted. There are now two state schools and two private schools for deaf-mutes, with 400 students (1907). The first school for the blind was established in 1811. This school has at present a faculty of ten instructors and about a hundred students. Children are admitted at the age of ten, after having attended one of the two preparatory schools for the blind.

The State gives about 130,000 kr. a year for the support of the advanced school. The first school for the feeble-minded was established in 1855, as a private institution. There are now one boarding school with 200 pupils, one asylum with 110 children, and five asylums for feeble-minded adults.

*Other Educational Agencies.*—These consist of libraries, museums, and learned societies. Library facilities in Denmark are naturally best at Copenhagen. There the Royal Library is located, with a collection approximating 575,000 volumes, and the library of the university, with about 425,000 volumes. The latter makes a specialty of science, medicine, and technology, while the former is strongest in literature. There are more than 600 smaller libraries in the cities and towns of the provinces, with 345,000 volumes, and 800 children's libraries, with 40,000 volumes. There are also 400 small pedagogical libraries for teachers in the rural communes.

The Danish school museum was established in 1887, through the influence of the Society of Danish Scholars. It now has a well-selected pedagogical library, and aims to bring together books, material, and school appliances, for the enlightenment of teachers. (See MUSEUMS, EDUCATIONAL.)

Denmark contributes its full part to the intellectual activities of Europe, as is indicated by the number of its learned societies. The Danish Royal Academy of Science and Letters was founded in 1742. Its members, 150 in number, are chosen from the eminent scholars of Denmark and other countries. The Academy meets at stated intervals, offers prizes each year for meritorious work, publishes scientific memoirs, and proceedings of its meetings. It has an endowment fund (300,000 kr.) sufficient to meet the annual expenses. The Royal Antiquarian Society was founded in 1825 for the purpose of diffusing knowledge of the philology, ancient literature, and archaeology of the North. The society encourages investigations and publishes the results of researches in the archaeology and antiquities of Scandinavia. Its membership is large, and is not confined to Denmark. The society has an endowment of about 200,000 kr. Other notable societies are, The Danish Royal Society for National History and Language, founded in 1745; the Natural History Association, founded in 1833; the Royal Geographical Society, founded in 1876, which has a membership of 700 and publishes its own journal (*Geografisk Tidsskrift*).

National interest in modern science is promoted by numerous additional societies and associations, each devoted to some one specific department of the natural and sociological sciences. Scientific knowledge is widely diffused throughout the kingdom by the system of free public lectures maintained by the university, in which every professor is expected to

bear a part annually. The system of instruction carried out in the People's High Schools interests the rural population in the scientific principles underlying agricultural processes, and the result is seen in the constant increase in agricultural products, the great source of wealth to the kingdom. L. D. A. and A. T. S.

**DENOMINATE NUMBERS.** — Numbers that have some unit of measure expressed are commonly known as denominate numbers. For example, 3 ft., 7 bu., \$8, are denominate numbers. They are a special form of concrete number, the latter term being applied to any number that has a unit expressed, as 3 men, 4 trees, or 2½ ft. In all such cases, however, the number part is essentially abstract, and if we take the primitive notion of number, we should have to exclude concrete number entirely. The expression is, however, a convenient one in teaching, and should be retained. Denominate numbers are occasionally written as compound numbers (*q.v.*), as in 2 ft. 6 in. Textbooks frequently drop the term "Compound Number" (*q.v.*) entirely, this form of number having become less used of late years. The term "Denominate Number" suffices for educational purposes, namely, to furnish a title for the chapter dealing with the common tables of measure. D. E. S.

**DENOTATION.** — See MEANING; TERMS.

**DENSTONE COLLEGE.** — See COLLEGE; GRAMMAR SCHOOL, ENGLISH.

**DENTAL EDUCATION.** — In North America three factors have contributed to dental education; schools of dentistry, dental so-

cieties, and dental magazines. In no other country are schools so efficient, societies so numerous, and magazines so instructive, while the art of dentistry has become preëminent. This is due partly to the innate adaptability of the American character to a rapidly developing profession, and partly to environment. Whether the teeth of Americans are more prone to caries than those of other nationalities is a moot question, but it seems fair to assume that miscegenation, climatic influence, and the higher degree of civilization enjoyed by the middle and lower classes here have their influences. The science of dentistry is indebted to both European and American influences, the European contributions being in excess of those derived by the art of dentistry from that source.

Prior to 1839 a dental education, meager as it was, could only be obtained by the apprenticeship system, or by a similar arrangement between student and practitioner whereby the former, for a fee agreed upon, was given instruction for a specified term by the latter. Many practitioners would accept no students even on these terms, but jealously guarded the secrets of their offices from even the members of the profession. In 1839, the first dental college in the world, the Baltimore College of Dental Surgery, was established through the efforts of Horace H. Hayden and Chapin A. Harris, two Baltimore dentists, who had previously endeavored to persuade medical colleges in that city to establish dental departments, but without success. For several years previous to this, Hayden had taught classes of practitioners and students at his office, probably the first systematic dental teaching ever attempted. The Ohio College of Dental Surgery was founded in Cincinnati in 1845, the Pennsylvania College of Dental Surgery in Philadelphia in 1850, and the Philadelphia Dental College in 1863. From 1863 to date, a new college has been organized practically each year. In 1909 there were approximately eighty dental schools of all classes in the United States, of which approximately sixty were doing genuine and more or less effective teaching. Most of these are stock corporations; all are unendowed; a number are dental departments of medical colleges; seven are departments of state universities, namely, the state universities of California, Iowa, Maryland, Michigan, Minnesota, Pennsylvania, and Tennessee; and a score or more are departments of, or are affiliated with, various universities. Two schools, Meharry Dental College, Nashville, Tenn., and Howard University Dental College, Washington, D.C., are for negro students only. Practically all the progress made in dental education has been without a dollar in benefactions or endowments.

Prior to 1870 but few states had dental laws and boards of examiners. In 1910 every state in the Union had both. As various states

passed dental laws providing for boards of examiners, and as these boards became more strict in their examinations, the demand for a dental education on the part of prospective applicants for registration became greater. Thus state laws were a potent factor in multiplying the number of colleges in the later years of the nineteenth century.

No specified preliminary education was required of applicants in the early decades of dental college life. The course in the Baltimore College of Dental Surgery for some years consisted of sessions of four months, beginning early in November and closing the latter part of February. Both theoretical and practical instruction was given, the first public dental infirmary being opened in 1846. The students were examined at the close of the course, and those showing unusual proficiency were graduated. Practitioners were also admitted to these examinations without previous attendance, and were graduated if found competent. This provision was in force in some colleges as late as 1870. The first advance in an educational way was to require students to attend two sessions unless they had been five years or more in active practice. In the latter case they were eligible to come up for final examination at the close of their first session. As late as 1880, this rule prevailed in many colleges, although the length of the session had quite generally been extended to five months, the preliminary educational requirement at that time being "a good English education." At this time, the course was not a graded one. The same lectures were given to both the first and second course students. The graded course was not generally adopted in the colleges until after the adoption of the three-session course, in 1890-1892, and as late as 1903-1904 students of at least one Eastern college were hearing the same course of lectures in each of three years.

The National Association of Dental Faculties, organized Aug. 4, 1884, whose membership for more than twenty years embraced practically all of the reputable dental colleges in the United States and Canada, has done more to raise the standard of dental education than any other one force, and especially as it secured uniformity in advancement. At its first session a resolution was adopted requiring two full courses of lectures in two separate years before students came up for graduation, thus doing away with a year's credit for experience gained in practice or in the office of a preceptor. A year's credit was given to the graduate in medicine. The minimum length of session was five months.

In 1887-1889 several valuable text-books were published as a result of the efforts of Faculty Association delegates. In 1891, the course was lengthened to three years of not less than five months each. The conferring of honorary degrees was discouraged by the

Association, and was absolutely prohibited in 1898. For some years after the three-year course was adopted, graduates in medicine, pharmacy, and veterinary medicine were granted one year's time credit. As regards pharmaceutical and veterinary graduates, this rule was abrogated in 1900. With the session of 1896-1897, the sessions were lengthened to not less than six months each. Beginning with the following session, a preliminary education conferring the right to entrance into the first year of high school was adopted. In 1898 this was advanced a year. In 1899 the length of the session was again increased, this time to seven months, and in 1901 a certificate of entrance into the third year of high school, or an equivalent education, was made the minimum preliminary requirement. A four-year course of seven-month sessions was inaugurated in the fall of 1903, but after a year's trial the schools returned to the three-year course, prescribing minimum sessions of thirty teaching weeks exclusive of holidays. At the session of 1908-1909 the session was lengthened to thirty-two weeks. At this session, also, the preliminary entrance requirement was raised to a certificate of entrance into the fourth year of high school, and at the session of 1910-1911, it was further advanced to a diploma from an accredited high school or equivalent credentials.

In 1909 the dental departments of the Universities of California, Iowa, Michigan, Pennsylvania, Harvard, and Minnesota organized a faculty association of their own.

The dental schools of Canada take high rank. All students, after graduation, are examined by provincial boards or by the Dominion Dental Council, representative of all provinces, this latter examination, if passed, conferring the right to practice anywhere in the Dominion. There are three schools in Canada, one at Toronto, one at Montreal, and one at Halifax. They are members of the National Association of Dental Faculties, and comply with its rules. In Mexico the only school, established in 1904, is a branch of the National School of Medicine.

There are several dental schools in England. Many of them are called "dental hospitals," and are public charities supported in part by civic appropriations. There are two schools in Paris, also. Germany, Norway, Sweden, Russia, and Italy each have their quota. Most of these are more or less intimately connected with the medical profession and medical schools, and in none of them is the technical aspect of training to be compared with that of schools in America.

**DENTISTS IN THE SCHOOL.**—See TEETH, HYGIENE OF.

**DENTITION.**—See TEETH.

**DENVER, UNIVERSITY OF, DENVER, COL.**—Founded in 1864 as the Colorado Seminary, developing in 1880 into the University of Denver. A preparatory school, college of liberal arts, graduate school, college law, music, a school of commerce, and a teachers' college are maintained. Candidates for degrees in the college of liberal arts must have had a high school course, and fifteen units are required for entrance into the freshman class. The usual college courses leading to the degree of Bachelor of Arts are offered. There is a faculty of fifty-five professors, and twelve instructors.

**DENZEL, BERNHARD GOTTLIEB (1773-1838).**—A prominent German educator of the Pestalozzian school. Born in Stuttgart, he studied theology at the University of Tübingen, and then took a position as a private tutor in Frankfurt-on-the-Main. From there he went to Yverdon and became an enthusiastic disciple of Pestalozzi. In 1811 he was appointed rector of the first Württemberg teachers' seminary at Esslingen, which position he filled to his death. Denzel was one of the first German teachers to formulate the true conception of the *Volksschule* (Public School) as a common educational institution which is to prepare the pupil for life as a man and as a member of society, without regard to any special vocation. He defines education as "the harmonious development of the physical, intellectual, and moral faculties." He also did valuable work in regard to special methodology in the elementary school. His chief writings are *Die Volksschule, ein methodologischer Lehrkursus (the Public School, a Course in Methodology)*, Stuttgart, 1817, and *Einleitung in die Erziehungs- und Unterrichtslhre für Volksschullehrer (Introduction to the Theory of Education and Instruction for Elementary School Teachers)* in four volumes, 1820.

**DEPARTMENT OF SUPERINTENDENCE.**—In 1865, at a session of the National Teachers' Association (*q.v.*), there was held a special meeting of state and city superintendents. This meeting decided to hold in February, 1866, another meeting for the purpose of forming a National Association of School Superintendents. The early work of this association was effective in procuring the organization of the National Bureau of Education. In 1871, when the National Teachers' Association became the National Educational

Association, there was organized as its first department that of School Superintendence, absorbing the National Association of School Superintendents before alluded to. For the first twenty years thereafter the department held one meeting each year with the National Education Association, but up to 1890 its most important meetings were held in the winter time, and with one or two exceptions in the city of Washington. Since 1890 the winter meeting has become much larger and has been more frequently held in the Middle West. This has assumed the character of a midyear meeting of the National Education Association. Since 1890 the department has elected its own officers at the winter meeting.

A list of the papers presented shows that such subjects as statistics, supervision, school organization, rural schools, manual training, and national aid to education have been prominent, although a great variety of other subjects have claimed attention. For twenty years after 1870 the organization devoted itself partly to establishing the National Bureau of Education, and partly to carrying on a campaign for national aid to the public schools. In the former it was successful, but the latter has ceased to be a live issue. In the field of statistics and reports the department was able to procure some uniformity, but no extensive adoption of more perfect methods of record and report.

See NATIONAL EDUCATION ASSOCIATION.

**DEPARTMENTAL SYSTEM.** — A system of school administration by which classes are assigned to different teachers for instruction in different subjects. The system is in practice in college education, and very largely in the high schools. As an administrative question, it gained its importance from the proposal to adapt it to elementary schools, at any rate in some grades. The plan differs from the employment of special teachers in that the teachers are permanently attached to the school staff and do not go round from school to school. While numerous advantages are claimed for the system, as many objections can be brought against it. It is thought that the teacher who instructs in but one or two subjects must become an expert in those subjects with all the enthusiasm and inspiration of a specialist, with the result that improvement in instruction follows. The presence of one teacher for one subject during several years insures continuity of the course, while the teaching of different subjects by different teachers secures variety of approach and contact with several types of mind, at the same time annulling the evil effects of the influence of a bad teacher. It is also claimed that teachers prefer to specialize along lines of their own interests, that the

scope of each subject as taught by a specialist is intensified and broadened, and that a pupil's ability along certain branches can easily be detected and encouraged.

The objections, on the other hand, are that the system leads to overwork, for each teacher sets a higher value on her own subject than on the others; that specialization in a subject is narrowing, and that particularly when taught only to the extent required in the grades; that expert knowledge is no guarantee of improved teaching ability; that the system interferes with the proper correlation of subjects and general all-round development; and lastly, that the pupils lack the controlling influence of one teacher and all that that means for them.

The departmental system is at bottom an attempt to apply a plan, which has approved itself in college and has been employed, perhaps not altogether successfully, in high schools, to conditions of elementary schools. It is based on the mistaken notions that children attend school in order primarily to obtain information in a number of subjects, and that the existing system of dividing school work into so many hours of this or that subject is ideal. The departmental system would further intensify the breach in that continuity of experience which is essential to the best development of the child. Unity of interest cannot be maintained with young children in the grades by dissipating their attention among many teachers, and the personal influence of one teacher is essential in school life.

A case may perhaps be made out for the employment of the system in the two highest grades, but only on the plea that in this way can the gap between the elementary and high schools be bridged. But the assignment of pupils to one class teacher must be retained even under this system. Such a class teacher would perform the functions of a housemaster in the English boarding school, or the preceptor at Princeton; he would be responsible for the attendance, good conduct, high standards of work, and general welfare of the pupils assigned to him. At the same time such a teacher might have charge of several school subjects. A system of this kind would, of course, be applicable, and is no doubt essential, to the high school.

**DE PAUW UNIVERSITY, GREENCASTLE, IND.** — A coeducational institution, chartered by the legislature of Indiana, Jan. 10, 1837, as the Indiana Asbury University, in honor of Francis Asbury, the pioneer bishop of the Methodist Episcopal Church. Until 1883, the

institution met, on the whole, with success, but in that year its existence was seriously threatened by lack of funds, when M. De Pauw gave the university sums at various times which, as afterwards added to by members of his family, amounted to \$600,000. In 1884, the corporate title was changed to De Pauw University. The government of the university is vested in a Joint Board of Trustees and Visitors; twenty-one out of the thirty trustees are elected by the Indiana Conferences of the Methodist Episcopal Church.

In organization the institution is a college rather than a university. It maintains an undergraduate college, known as the Asbury College of Liberal Arts, admission to which is by examination or certificate from a "commissioned" high school (see ACCREDITED HIGH SCHOOLS); a school of music, which confers the degree of Bachelor of Music, and also admits students without examination to partial courses; a school of art, which confers the degree of B.P. (Bachelor of Painting) upon the satisfactory completion of a course combining studies in both Fine Arts and Liberal Arts, and a preparatory school, known as the Greencastle Academy. De Pauw is distinctly a denominational college, and the religious interests of the students are carefully fostered.

The university grounds are divided into six separate campuses of from three to eight acres each, situated near the center of Greencastle. Grounds, buildings, and equipment were valued (1910) at \$475,000, of which sum \$85,000 is the value of dormitories and residences. The total annual income is \$86,000. The average salary of a professor is \$1700. The number of students in 1910-11 was 1053. The instructing staff numbers forty-one.

#### DEPARTMENT AND WEATHER. —

Human behavior is affected by all kinds of changes in the physical environment. It has been shown by statistical examination that crime and misdemeanors of every order vary with the conditions of the weather. Thus, when there is extreme heat, to which human beings adjust themselves with great difficulty, there are likely to be many forms of depression and behavior corresponding to this mental abnormality. When the atmospheric conditions are such as to stimulate the nervous system, certain forms of excitement appear. Thus it has been shown that a high wind is likely to affect unfavorably the behavior of school children. Some inquiries into school deportment seem to indicate the very general relation between such deportment and changes in the weather. Certainly weather conditions which produce exhaustion or fatigue or lassitude affect the general school work and indirectly the discipline of the school.

**DERANGEMENT, MENTAL. —** A general term to include all abnormalities in the mental life of the individual, whether of sufficient intensity and duration to be called insanity, or of so mild and temporary a character as, sometimes, to be unnoticed by friends and relatives. The more or less permanent forms of derangement will be discussed under the topic INSANITY (*q.v.*). Temporary derangements are to be found associated with many diseases not usually classed among those of a mental character. The dreamlike states in epilepsy, the mental hebetude accompanying and following many diseases of the internal organs, the mild deliria of short duration, the brief periods of confusion accompanying physical exhaustion, and certain amnesias are derangements of a mental order, but often they are not sufficiently pronounced nor of sufficient duration to be classed with the insanities.

**DESCARTES, RENÉ. —** The celebrated philosopher, mathematician, and physicist; born at La Haye, France, Mar. 31, 1596, and died in Stockholm, Sweden, Feb. 11, 1650. At the age of eight years he entered the new college at La Flèche, a leading school for the education of the nobility, which was under the direction of the Jesuit Fathers. Here for over eight years he received special care for his physical growth, and the best mental training then available. Mathematics seems to have interested him greatly at this early age, and thus exercised the influence over his mind which was to reconstruct the whole modern realm of thought. The first two years of freedom from school were spent in Paris. After two years devoted to further study, he passed four years as a volunteer in the armies of the Netherlands and of Germany. His reflections began now to formu-

A GROUP OF LEADERS IN FRENCH EDUCATIONAL THOUGHT.

late themselves in the *Rules for the Direction of the Mind* (probably written 1629, published 1701). In his search for true knowledge he learned that doubt is essential to belief. Desiring quietude to carry on his new way of thinking, and seeking also, doubtless, escape from the vigilant eye of the Church, he secretly retired to Holland, the place of safety and of liberty. Here for twenty years he reflected and produced the works which established his place in history as the "father of modern philosophy" and started those intellectual influences which have continued to be vitalizing down to this day. In 1646 the charge of atheism was brought against him by a Protestant theologian, and the controversy that followed was characteristic of the times. Some time later receiving an invitation from Queen Christina of Sweden to visit Stockholm to expound to her his system of philosophy, he arrived in that city in October, 1649. The severity of the far northern winter climate and the changed mode of life hastened his death. Shortly before his death he handed the Queen the plans for an Academy of Sciences which he had been requested to prepare. In 1666 his remains were taken to France.

Des Cartes' best known work was a collection of "essays," published anonymously at Leyden in 1637. It contained the *Discourse on the Method of Rightly Conducting the Reason and Seeking Truth in the Sciences*, the *Dioptric*, the *Meteors*, and the *Geometry*. The last three were instances of results obtainable by a use of the method described in the first essay. The *Discourse* was written in French, and with such unusual clearness that it appealed at once to the learned and the common people. In 1641 he published in Latin the *Meditations on the First Philosophy* (in which the existence of God, and the real distinction of mind and body, are demonstrated. His most systematic work, *The Principles of Philosophy*, appeared in 1644. The *Treatise on the Passions of the Soul*, appearing in 1649, was the last of his works published during his lifetime. In this he attempts to show how the emotions are due to the union of body and soul, in connection with the action of the "animal spirits." The work on *The World, or Treatise on Light*, which he suppressed, as he did not wish to publish "the least word which would be disapproved by the church," finally appeared in 1664.

Des Cartes' contributions to knowledge extend over several domains. His high regard for the mathematical type of knowledge, already shown in his relation to analytical geometry, led him to endeavor to make its method the true method of philosophy. As a physicist he contributed to the theory of refraction of light, the explanation of the rainbow, and an estimation of the weight of the air. The origin of all cosmic bodies he suggested might be found in a primitive state of motion. He carried out observations in anatomy. His ability in psychological observations, coupled with his keen analy-

sis of the "natural" logic of mind, practically provided him with the cornerstones of his theory of the sciences and his system of philosophy. In addition to these services, whereby marked changes were in time effected in the subject matter that was taught in the higher schools, his life and thought became significant for education, inasmuch as they presented a clear and convincing realistic and philosophical opposition against the regnant system of tradition and hierarchism. In becoming a spokesman for the newer spirit of his age, he at the same time pointed out the direction which the coming ages were to take.

The beginning of the seventeenth century found Europe changing from the long-established scheme of authority over thought and action to individualism. Luther, Bacon, and Comenius had done much to hasten the movement. But it was left to Des Cartes to give a philosophy to this newer point of view and its human possibilities. This philosophy was thought coming to a knowledge of itself. Man lives in a world which is capable of rational interpretation. Freeing the mind from all presuppositions is established as a principle, and the attainment of self-evidence is set up as the goal. In order to eliminate the uncertainty of knowledge, Des Cartes courageously applies the method of universal skepticism. At last he discovers that one's own existence is certain because existence is necessary for one to think or to doubt. Thus he arrives at his famous conclusion: *Cogito, ergo sum*. This formula and the experience upon which it is based resists all doubt. Upon this he proceeds to build up a system of knowledge.

Des Cartes' importance in the history of education and its theory rests upon several facts. Every distinct philosophical conception has potential bearing upon a system of education. He is one of the first of the moderns whose careers reveal the compelling force emanating in a logical manner from philosophy and modifying later educational interest and activity. Also the principles of the method upon which his philosophy rests have direct bearing upon the problem of education. And, finally, being one of the best trained men of his day, his writings, which are more or less autobiographical, supply some information as to the state of education in his time, and his opinions on points in educational values come to have great weight. It should also be noted that he made no direct contribution to the literature of education, and did not undertake a solution of its more immediate problems as such. The reforms which his work helped to introduce became all the more significant, probably, just because he did not work as a teacher in the schools, but as one seeking the essential and universal elements in human nature.

The first part of the *Discourse on Method* has been rightly called "a chapter in pedagogy." As an autobiography it has a permanent place

in the important literature of education. The statement of his views on the educational values of school subjects really forms the preface to the application of his philosophical method to the problem of knowledge. The special aim of the latter was to make good the deficiencies which resulted from schooling in the different kinds of knowledge that were available at that time. It was their limitations that urged him to discover a method of reasoning, unknown in the books and the schools, which should become a source of certain, positive, and genuine knowledge, useful for the purposes of life. He demanded that education in practice should cease abusing literary and historical knowledge.

Des Cartes' influence upon pedagogy, especially in French schools during the latter part of the seventeenth century, was very marked. In a positive way, the practice in the Oratory (*q.v.*) and the Port-Royal schools (*q.v.*) showed a direct influence of his method and theories. In higher education one of the effects of his philosophy was the overthrow of scholasticism and the elimination of Aristotle from the seminaries and universities. Admitting that the syllogism had a value for the dialectical training of a young mind, he denied its supposed function as a means of getting new knowledge. As an experimentalist — using this term not too strictly — he did much to establish effectually the later realistic study of things. In a negative way, his relation to the pedagogy and the philosophy of the Jesuits is just as interesting. Educated in his youth by them, he later came to condemn their type of education. They, in turn, rejected his philosophy and condemned the Oratorians for teaching it.

His chief significance, however, is to be found in the influence his achievements exerted in reconstructing educational theory, and in the suggestion some of his ideas contributed toward the formulation of a number of educational principles. In establishing the distinction between the mind and the body, he exalted the former to such a degree that its discipline was made the end of all study. His view of innate ideas and of the innate faculties of the soul determined the measure of all educational means. The supreme importance of training the individual followed directly from his philosophical rejection of the principle of authority in knowledge, in place of which he advocated the principle of evidence and free examination. The appeal to reason as the criterion, and to inquiry as the means, of true knowledge led to the principle of individual liberty. The true end of mental interest and activity is, not erudition, but real knowledge. He announced the doctrine of the native equality of all minds. "Good sense is, of all things among men, the most equally distributed." "The power of judging aright and of distinguishing truth from error, is by nature equal in all men." The inequalities actually found among minds have their origin in education and the variety of

culture, although he admits repeatedly, that there are original differences in mental capacity; some minds work more rapidly, others more slowly; some are more original than others. But nature is not enough. Education must come in to supplement and direct it, so far as the mind is concerned. "To be possessed of a vigorous mind is not enough; the prime requisite is rightly to apply it." Education is therefore possible for every individual. It is democratized by being shown to be, not a privilege, but a natural right. From this it was but a step to the position which declared that each one has the right to think for himself. This is a demand that each mind is to be trained in thinking by handling facts at first hand. The routine learning and mechanical memorizing must be superseded, for it is reason that naturally thinks and knows truth when it is unhampered by words or other external authority and proceeds by means of the method of the natural logic imbedded in its nature. The goal of clear thinking based on evidences becomes a pedagogical ideal. Des Cartes was probably the first to lay down as a principle the demand that the order of acquiring knowledge shall follow the natural order of mental activity. He explicitly stated that the mind proceeds from the known to the unknown, from the simple to the complex, from the easy to the more difficult. This order he applied to the adult in the pursuit of science; but, by implication, the method is even more important for the young mind just beginning to learn to think.

These principles of education appeared not by implication from his philosophical system nor its long influential history on the Continent, but were set forth in the rules he wrote out for the constant guidance of his own thinking. They constituted the *Rules for the Direction of the Mind*, and were summarized in the second part of the *Discourse on Method*. The former unfinished work was to have contained thirty-six rules, but only twenty-one were written out. They give his best statement of the "natural" logic he discovered. How directly modern pedagogy is indebted to Des Cartes for some of its principles may be seen in some of the *Rules* (Torrey, pp. 61 ff.).

**DESCRIPTION, RHETORICAL.** — See COMPOSITION.

**DESIGN.** — As related to the arts, design usually implies the planning of the form, structure, and decoration of objects so that they shall satisfy utilitarian and æsthetic demands. The degree to which an object fulfills these demands determines the excellence of its design. The conditions which meet the utilitarian demands are obvious, namely, that the object shall adequately fulfill its purpose. The æsthetic demands are more complex, and generally include utility and the beauty which results from pleasing proportions and outlines, appropriate treatment of material, and suitable decoration.

**Industrial Design.** — In the constructive arts the utilitarian demand has first to be considered. Until this is met as completely as possible, it is difficult to find in ornamentation any permanent enjoyment which at all compensates for the dissatisfaction arising from imperfect fulfillment of purpose. Attempts to beautify inadequately planned or constructed objects by profuse decoration give an impression of effort misdirected. For example, a chair which is uncomfortable is poor in design. Expensiveness of material and richness of ornament or technical excellence of construction cannot compensate for failure to fulfill the function of a chair, a failure which prevents lasting pleasure in whatever formal beauty may appear in the details. Closely related to this utilitarian consideration is the pleasure in fine craftsmanship which is not content with a crude construction barely sufficient to meet the needs, but which demands also a mastery of tools and processes. The satisfaction that arises from the contemplation of an object which adequately fulfills its purpose and is well constructed readily transcends the crude stage of relief because a need is met, and develops into pleasurable appreciation of the fact that intelligence has shaped raw material into an effective creation by means of clear understanding of its purpose and perfect mastery of the materials. This contemplative appreciation of a well-constructed object which perfectly fulfills its purpose is an æsthetic satisfaction, and thus in industrial products, utility and excellence of workmanship appear as the primary elements of good design.

**Design in the Fine Arts.** — The conditions which satisfy the æsthetic demands for formal beauty appear to be as follows. Beauty of proportions and outline is one of the chief requisites. Experimentation with the possibilities of different relations of proportions and areas, for example in placing a given number of windows in the front of a house or determining the position of a title to be printed upon a book cover, shows some positions to be so much more pleasing than others that they lead to a definite choice. An analysis of the results generally discovers a consistent though not monotonous interrelation of measures in the case of the

pleasing proportions. Experimentation with curves shows also that some give greater pleasure than others, and that in the most pleasing forms the variations of curvature are consistently related. Thus the standards of excellence in proportions and outlines appear to be based not upon fashion, but upon universal and permanent reasons. An understanding of the mathematical nature of the relations of measures upon which good proportions and curves depend is not necessary to an æsthetic enjoyment of these forms. One may become trained to discriminate almost unerringly between fine proportions and those that are commonplace, without knowing why the results are pleasing, or that any calculable relation exists. The response appears to be immediate in terms of enjoyment, and the adjectives "good" and "bad" as used by the designer with regard to proportions and curves are meaningless except in terms of pleasure awakened.

After the demand for utility has been met, the next important condition of excellent design is this of good proportions and fine outline. The opportunities offered by the arrangement and refinement of necessary parts of the structure itself should be utilized to the full before ornament is added, for in placing and shaping of essential features lies the greatest possibility for beauty. For example, in the instance of the chair which has been so planned as to fulfill all the demands of utility such as strength and comfort, there is abundant opportunity, without transgressing these, to vary the position of braces and panels and the shape of the back and arms and legs so that pleasing proportions shall result. These same essential parts may also be so modified as to give the chair a consistent character throughout. It may be solid and heavy, or light and delicate, and yet still outlined by straight lines, or it may repeat curves of a particular sort. When the interest of a skilled and artistic workman continues beyond the satisfaction of utilitarian demands, and he lingers over his work, experimenting with its proportions and outlines till they show the same character throughout, the object gains an individuality which is the basis of style. When the object is one of a kind which the builder repeats indefinitely, he is able to embody in each successive product the hints gained by previous experiments, and gradually to perfect a type. Where many artisans are at work in the same line, a still more thorough exploration of the possibilities of a given theme occurs. Thus styles of architecture, furniture, metal work, etc., have developed.

The same interest that leads to utilizing to the full the possibilities of beauty in the proportions and outlines of the necessary structural elements frequently influences the artistic craftsman to carry the manipulation of his product still further, by playing with and echoing its nature and structural features by such treatment as calls forth the beauty of the materials, for ex-

ample, the grain or polish of wood and the color or texture of metal, sometimes making even the tool marks a decorative feature, as in hammered metal or carved wood. This interest finds expression also in ornamentation which emphasizes and perfects the style, or symbolizes the history, use, or surroundings of the object. Such ornament is not an accidental or unrelated addition to an object, but an essential expression and organic part of it. Such decoration as this is clearly differentiated from that sort of ornamentation which results from inability to respond to the stimulus of a perfected idea and which therefore depends upon the barbaric love of heterogeneous collections unorganized by any dominating thought, resulting in a competition of interests. Good design in ornament is not assured by mere technical excellence. For example, an Indian's head may be realistically painted upon a vase, but neither has any organic relation to the other, and neither enhances the beauty of the other. They are competing artistic interests accidentally juxtaposed, and therefore poor in design.

Good industrial design demands that an object adequately fulfill its purpose, that its workmanship be skillful and its construction sincere, that the possibilities of beauty in the materials and in orderly and consistent arrangement and shape of necessary parts be utilized to the full, and that ornament where used shall be a fulfillment or reinforcement of the idea of the object.

**Relation of Design to the Arts of Representation.** — In painting and sculpture, the utilitarian demand is not so evident as in the industrial arts, but is still a prominent element of excellence. The mural painting should primarily be a painting designed for the wall in a sense that is not fulfilled by merely suiting its dimensions to those of the wall and its subject to the surroundings. The technical treatment, the qualities of color, and the disposition of lines and areas must conform to the mural idea. Even the apparently independent easel picture is not at best advantage, if it must be made with no regard for its permanent location. Statuary is usually required to be an integral part of an architectural or landscape setting. Some correspondence exists between the subject of a painting or piece of sculpture which determines the kind of response it seeks to awaken, and the utilitarian purpose of an article of industrial art. The appropriate purposes of arts of design are those which cannot be so well accomplished by literature or music, and are those which depend for their effect not only upon what things are represented, but largely upon such an arrangement of them as shall result in the formal beauty of consistently related areas, balanced masses, pleasing flow of line, and harmonious color. The artist must be sufficiently master of his facts to justify his courage and be convincing when he uses natural material for his own creations, but he must also understand design, or his creation will

lack the quality which justifies a modification of facts as presented by nature and distinguishes a work of art from a photograph or cast from nature, namely, that a work of art is the embodiment of a human idea.

**Place of Design in Education.** — The purpose of a study of design in education is to develop the desire and capacity to enjoy beautiful things, to establish standards of taste, to raise the æsthetic sense from the level of response only to those accidental stimuli which are powerful enough to arrest and hold attention without effort, to an appreciation of what gives increasing pleasure because of elements that are permanent and universal. Such training should result in new sources of enjoyment for the individual, and in a higher standard of industrial products. The production of a great amount of raw material is not so valuable an outcome of civilization as the ability to convert raw material into the highest grade of finished product.

**Present School Conditions.** — Design has a large place in the elementary and secondary schools of nearly all countries prominent in education. Individual towns and cities, even in the same country, often vary greatly in their methods, but perhaps the most significant and general difference in methods in the United States as compared with other countries is that in the schools of the United States the chief emphasis is usually laid upon the exercise of originality from the earliest years, while in most other countries a broad acquaintance with the best design of the past and a thorough training in drawing from nature and historic ornament is generally insisted upon as a necessary foundation for originality. In the schools of the United States design has in the past been largely in the field of ornament worked out according to the principles of formal beauty, and used, if at all, as decoration applied to completed objects. Probably this has been true because design has been taught so frequently by a department having no organic relation with that which has taught constructive work. On this account the teachers of construction have emphasized the phase of design relating to utility and technique, while the teachers of art have given chief attention to that relating to the formal beauty of isolated shapes. Under these circumstances the relation of ornament to structure and that other important phase of design, namely the possibilities for beauty that lie in the disposition of structural parts even where no decoration is used, have often been overlooked. The study of unrelated principles of formal beauty however, is gradually giving way to an acquaintance with concrete problems which embody all phases of design and offer opportunity to give to each the consideration warranted by its relative value.

The study of design usually begins in the lowest grades and continues through the high and normal schools. The problems are increas-

ingly those related to actual conditions in school, home, and community. The lines of study may be generalized as follows. A consideration of the utilitarian conditions which the problem must meet, experimentation with the forms involved, to discover the best shapes and arrangement, appropriate ornamentation in form and color, and study of the best available examples. The phases of design which emphasize simple decoration with repeated forms as in borders and surface patterns are considered as best adapted for the youngest children. Those which call for original judgment as to utility and formal beauty and harmonious color demand increased maturity.

In England and in the leading European countries emphasis is laid upon the relation of the arts of design to the industries of the country. The present trend appears to be toward developing originality in design. The directing idea underlying this tendency is that design develops best when the mind depends largely upon its spontaneous activity, but when it is furnished with the widest possible knowledge as a fund of suggestion. The acquaintance with the best examples and the training in drawing as a means of securing data is much more thorough than in the United States, and design is more intimately related to the industries of the country. The British and European attitude toward the teaching of design is suggested in the definitions of its purpose made by the British Department of Practical Art in 1852, which have not been departed from, and which are practically true for European countries. (1) General elementary instruction in art as a branch of national education among all classes of the community, with the view of laying a foundation for correct judgment both in the consumer and the producer of manufactures. (2) Appreciation of the principles of technical art to the improvement of manufactures, together with the establishment of museums by which all classes might be induced to investigate those common principles of taste which may be traced to the works of excellence in all ages. W. S.

**DESIRE.**—The mental state which precedes voluntary effort on the part of an individual. Desire grows out of apprehension of some object which is needed in the individual's life, either for purposes of self-maintenance or purposes of pleasure. An individual's desires may be regarded as indicative of the individual's present training and general adaptation to his surroundings. On the relation of desire to behavior see article on WILL.

**DESKS AND SEATS, SCHOOL.**—If the education of children within the schools were carried on in a strictly rational manner, the problems growing out of improper school desks would be reduced very materially. If the school work were organized around the various lines of activity within the range of the capability and delights of the children, there would be no need for almost constant sitting, with the result that most of the dangers due to habitual abnormal posture would disappear. But good school desks would be necessary even under conditions of ideal school activity, and under the present sit-read-and-write scheme, they are of very great importance. There are certain requirements for satisfactory school desks well understood by all intelligent teachers, and in the main, the best desks now on the market are constructed in accordance with these requirements. There are certain other demands, however, not yet generally understood by teachers, and accordingly there are no desks on the market embodying some essential hygienic features. Progress toward better school desks has been made, just as progress in all lines of school work. First a clearer appreciation of what is needed has come, and then the eagerness for accomplishment which invariably accompanies such recognition.

The hygienic requirements of thoroughly satisfactory school desks may be stated as follows:—

1. The seat should be disconnected from the desk in front, and also from the one immediately behind. The reasons for this demand are in the main self-evident. This arrangement gives perfect freedom for adjusting the pupil to his seat as well as to his desk, without in any way disturbing a similar adjustment for the pupil next in front or behind. There are often great differences in height between pupils in the same grade or section, and proper classification cannot be made without frequently seating those who thus differ in height and size in adjacent parts of the room and even in the same row. In the next place, when desks and seats are thus disconnected, the uneasy movements of one pupil in his seat do not disturb the work of his neighbors. This gives an ad-

vantage in school management not to be overlooked. Furthermore it enables the teacher to hold each pupil responsible for the care of his desk and in this way to inculcate habits of neatness and conscientious care of public property, a lesson in real civics which ought to be of vital interest to all concerned.

2. The seat should be readily and easily adjusted to suit the height of the child, and this adjustment should neither disarrange nor disproportion the form of the seat board nor the back of the seat. It took almost a century of observation and effort on the part of teachers of our public schools to get those whose duty it was to build schoolhouses and to furnish them to see the need of making the seats fit the pupils instead of trying to make the children adapt themselves to the benches. It was a common thing fifty years ago to see school children suspended throughout the school session on benches so high that their feet could not touch the floor. Even to-day those who make school benches and those who buy them scarcely realize the urgent need of desks easily and readily adjustable to each child in attendance. Not a few of the modern desks, which are adjustable as to the height of the seat, are poorly constructed with reference to the adjustment of the height and shape of the back rest. It stands to reason that as children grow the back rest should be adjusted to conform to the changing form of the body, if children are to do their work with the least fatigue and without malformation of their bodies. In this connection the attention of the reader ought to be called to the fact that during the adolescent period of a girl's development, the diameters of the pelvis are rapidly changing, the small of the back, when sitting, is higher from the seat board, and hence frequent adjustment of the back rest is necessary. Who has not seen the well-developed young girl in high school attempt to relieve the strain of long-continued sitting on poorly adapted benches by putting a book against the small of her back? The typewriter chair, with its sliding block on the back rest, illustrates what a restful seat demands, and should be copied in some form in all school seats, especially those designed for well-developed girls. A seat may continue to be the proper height from the floor, while the back rest may require frequent shifting. It is a matter of congratulation that this special need of the girls has been noticed by certain school authorities and steps taken to supply the deficiency. In the *Annual Report* of the Schoolhouse Department of the Boston Public Schools, for 1905-1906, there is a discussion of this point, from which is quoted the following: "The designs for the two forms of seat backs now in actual use were developed to meet what a careful testing of individuals showed to be the average lumbar spine curves in children of primary and grammar school age. As time went on, and these models came into actual use for hundreds of

scholars, it became obvious that one factor had not been sufficiently considered, namely, the change in pelvic and lumbar curves in certain girls at, and beyond, the age of puberty. There is, of course, at this age a marked physiological and anatomic change. The boy changes in size only, the girl in shape as well; and no change in height adjustment can make it practicable to fit male and female scholars with any single form of back rest when once the females have undergone this change. . . . After a good deal of trial and experiment, a model has been evolved which seems to meet all these requirements adequately. The points to be considered are that the girl of the given age, thirteen to fifteen, or thereabouts, may, in certain instances show: An increased breadth of hips; and an increased height from seat to waist, due not to bone change, but to the increase of fatty tissue in the gluteal region (and incidentally to the increased bulk of clothing that comes with the assumption of adult styles). It is not in all cases that these changes occur. Even with the completion of the changes of this period, many mature and normal girls show little of this special change in curves, but the minority who do show such a change must be comfortably accommodated, and for this reason this new seat-back has been designed, showing the following modifications: (a) An increase in the lumbar curve in the antero-posterior plane. (b) An increase in the maximum height to which the back may be adjusted. (c) A broadening of the curves of the seat as a whole. (d) A flattening of the lower curve corresponding to the maximum breadth of hips." (See *Report of Schoolhouse Department, 1906*, pp. 86-87.)

It is not safe to depend on supplying the proper height of seats to all the pupils in an ordinary schoolroom, especially to the grammar grade, by relying on the manufacturers to furnish several sizes or numbers. The practical outcome of the discussion on this topic ought to be this: Every child has a right to demand a school seat adjusted to his individual height and form, and it is the duty of the authorities to supply it, and that of the teacher to adjust it. If this is not done, ill effects, both physical and mental, may certainly be expected.

3. The back of the seat should be just high enough to support the back of the pupil, when sitting erect, from the shoulder blades downward, and should be made to conform to the natural curve of that part of the back. There are very few school seats on the market not too high in the back, and fewer still whose backs have the proper curve, or the means of adapting them to the proper curve.

4. The seat should be in the form of a chair with no side arms, and the seat board ought to slope gently from about two inches from the front toward the back, so that at its back it would be from one half inch to an inch lower than in front. It ought also to be slightly higher along the sides than in the center. The

front edge of the seat board should be rounding, and thus offer no sharp surface to irritate the limbs or check the circulation.

There can be little hesitation in saying that the typewriter's chair furnishes some fundamental ideas for the best school seat, and especially for the use of girls in the high school. The only criticism on the backs of these chairs is that they are generally open below the sliding block, and hence sometimes cause uneasiness with reference to proper adjustment of belt and placket. In that form of desks most frequently found in schoolrooms, the seat is fastened to the desk immediately in the rear, and is as long as the desk top. There seems to be no valid reason for this, even from the point of view of construction. It is certainly better not to have the seat any longer from left to right than a comfortable sitting posture of the body demands, for this would prevent much careless lounging about, and also make it much easier for the pupil to pass in and out. Besides, it would give a little better standing room by the side of the desk.

When benches are used, and the seat is the same length as the desk top, in order to lessen the difficulty of getting in and out it has been found necessary to hinge the seats so they can be raised when the pupils wish to get out. This has always been one of the noisy, troublesome features connected with such desks, though it does afford a janitor more room when cleaning the floors. When seats are made the proper length from side to side, and when they are properly placed with reference to the desks, the necessity of hinging them has largely disappeared. Seats made in chair form represented by the accompanying cut are among

the best on the market for school purposes, and are used in many parts of our country, and there are no serious objections to them on account of the inconvenience of getting out and in. At one time seats like these swiveled to the upright were manufactured, but they were soon found to be impracticable, for the children were not only unsteady while at work, but they found much fun in turning about, and became expert in making the seat squeal. A curious form of seat board was described by Horace Mann in the supplement to his first *Annual Report*. It

was designed primarily, as the accompanying cut will show, to furnish standing room, rather than to make it easy for the pupil to get into his seat or out of it.

No satisfactory seats appear to have been made which depend on adjustments to provide each child with a seat of the proper width. Fortunately the dangers incident to maladjustment here are not so great as those where the seat board is too high or too low. Still there are some important considerations touching this matter which teachers, and school authorities in general, should not neglect. If the seat board is too wide from front to back, it will cause the pupil to slide away from the back rest and bend over the desk. If it is too narrow, it will not furnish sufficient support for the thighs, thereby impeding circulation and also rendering the sitting posture unsteady and awkward. The seat board ought to be sufficiently wide to reach within at least two inches of the under side of the lower limbs, when flexed at the knee, when the pupil sits well back in the seat and properly uses the back rest. In the main, the various sizes of seats, furnished to suit the grades by the manufacturers, are not seriously at fault in this respect. But this should not relieve the teacher from making every effort to secure the best adjustments possible.

5. Desk tops ought to be made of well-seasoned hard wood, and finished with a dull surface to prevent troublesome light. At present, most desk tops are too light in color, and reflect into the eyes useless light. The children would get a good deal of relief from eye-strain, if the desk tops were of a dark dull brown rather than the natural oak or maple finish generally found. It stands to reason that all of the needless reflected light that can be kept out of the pupil's eyes will serve to make that from his book or paper more effective.

While some objection might be raised to darker desks on the basis of light absorption and the more somber tone thus introduced into the schoolroom, all observant teachers will remember that the best and most satisfying furniture in the homes, historically considered, are those pieces made of the dark woods, or those stained to give the dead weathered effect. Besides, the walls above the line of vision with their lighter shades, and the pictures, maps, etc., will furnish sufficient brightness of tone to counteract any somber effect produced by a darker colored desk. The danger due to the absorption of light would necessitate light-colored desks in all rooms not sufficiently lighted.

6. One of the necessary conveniences of a school desk which gives the teacher much trouble is that of inkwells. Perhaps the time is coming when fountain pens will be made sufficiently cheap, durable, and reliable to warrant school authorities in furnishing them free to the children of the upper grades. But that time is not here, and at present there must be used inkwells set somewhere in the desk top.

The best place for these is on the level ledge near the right-hand corner. They must be easily removable by the janitor when they need cleaning; they must be covered when not in use, to prevent evaporation and the gathering of dust in the ink, and they must be so situated that they can be easily filled without spilling the ink on the desk. When placed as far to the right corner as possible, they offer less temptation for the listless child to handle or disturb them thoughtlessly. Then, too, this position removes them from contact with the ordinary book or writing tablet. They should be set flush with the surface of the desk top and fitted with a noiseless, close-fitting lid.

7. Each desk should be so constructed as to furnish a safe, convenient, and inclosed place to hold all necessary books, pencils, and paper when not in use. The usual way is to insert a shelf some inches below the desk top. This plan is not satisfactory, as every teacher who strives for efficiency and neatness knows. From such shelves, books are always falling because the child can neither see how to arrange them when putting them away, nor can he easily get the book he wants after it has been put away. When so placed, books and papers gather much dust, and are rarely arranged neatly, even though the teacher wastes

much time in inspection. Such shelves, if wide enough to accommodate geographies and other books of like size, are often troublesome to the knees of the pupils in the higher grades. A much better arrangement, in every way, consists in making a tight box under the lid of the desk, as shown in the accompanying cut. This keeps all books, papers and implements out of sight when not in use, shields them from much dust, and prevents them from falling on the floor. It also often prevents books from being lost, or taken by those to whom they do not belong.

8. Aside from the proper height of seat and desk, and proper amount of light, heat, and fresh air, nothing in the way of school hygiene is more important than the proper adjustment of the desk top to the work the pupil is called upon to do.

The general truth which should be emphasized is that the line of best and easiest vision

to the page of a book or writing tablet will fall approximately at a right angle, and either the child will adjust *himself* or else he will adjust his *books* to meet it, but cannot adjust his writing to meet it. Any teacher who has given unbiased thought to this matter, and who has sought to habituate her pupils to sit erect while writing or reading at flat-top desks, or those with a slant even as much as  $10^\circ$  or  $15^\circ$ , will agree that it is practically impossible to keep children from bending over their work. Day after day and month after month, attempts are made to habituate certain classes of children in the primary grades to work while sitting erect. They are eager to obey, as nearly all children of the primary classes are, but they cannot keep straight. They do not bend over out of a spirit of carelessness or laziness, but because of a demand for clear, distinct, and unmolested vision. And when one finds school children *en masse* persistent in any line of behavior, it is always a wise precaution to with-

hold judgment against such behavior until time has been taken to investigate the real causes underlying such action. As a result of certain attempts to habituate children to a proper posture while seated at the ordinary desk with a top sloping about  $10^\circ$ , it was found that in nearly all cases the pupils held their books in their hands, and that the

angle of easy vision apparently demanded a slope of  $45^\circ$ . A comparable experiment could not be made for actual writing because there were no desks with that slant to use, and holding paper or even cardboard for writing introduced too many difficulties. However, when asked to hold their writing book in such a way as to read most easily, the same results, of course, were obtained as in the case when holding printed books. Now, when considering these results with reference to the problems of crooked backs, narrow chests, myopia, and many other ills due to improper posture, it became evident that the children are being seated in desks which make it absolutely necessary for them to lean over to read and write, or else to hold their books in their hands. It is very plain that they will not hold their books properly for any length of time, for the simple reason that it is impossible for them to do it. Children are restless partly because they fatigue quickly in

## DESKS AND SEATS

any one position, and to expect them to hold up their books, in order that they may sit in an erect position, is altogether beyond reason.

An Adjustable Steel Frame Desk and Seat.

But when they rest their books on the desk, to get the right angle of vision and sufficiently near the page to read easily, they must of necessity bend over their work. On this basis and no other can one account for the persistent tendency of school children to take bad postures, for otherwise they will take a normal position for the greater part of the time. And just at this point it must be insisted upon that children must be allowed to rest themselves even from sitting erect. Anybody knows that it is very restful to bend over occasionally, even though sitting in the most comfortable chair and listening to an interesting speaker. But school desks as at present made are undoubtedly demanding abnormal postures and making them habitual. The objection that the ink will not flow well when writing on a desk at a slant of  $45^\circ$  is of course rather serious, but only when considered with reference to the time spent in writing with ink. But this forms a very small part of the written work of the children, and the pencil can be used as readily on a desk of this slope as on a flat one. Besides, the time is almost here when fountain pens will be used in the upper grades instead of the ordinary steel pens, and then the difficulty will be practically overcome, for these often need a little holding back to prevent flooding. "The least possible work will be given the eyes if the reading mat-

Adjustable Desk and Seat made of Compressed Steel.

ter rests on a desk at an angle of  $45^\circ$  with the horizon, because in this position the bottom of the page will be at the same distance from the

## DESKS AND SEATS

eye as the upper part, and the eye will be able to read all the type thereon without changing its focus to any appreciable extent. For writing, however, a desk top at an angle of  $45^\circ$  would have serious disadvantages. For instance, the ink would not flow properly from the pen at this angle, and, moreover, the arms and hands would have to be held in an irksome and tiring

A Favorite German Desk.

position. The most convenient slant for the writing desk is an angle of  $15^\circ$  with the horizontal." (Lyster, R. A. *School Hygiene*, pp. 123-124. London, 1908.) With reference to Dr. Lyster's statement that writing at a desk with a slant of  $45^\circ$  necessitates that the "arms and hands would have to be held in an irksome and tiring position," it will be illuminating to recall

that during the Middle Ages, when the best writing the world has ever seen was done, and when all books were made in manuscripts, the monks and copyists almost invariably worked at desks with a slant approximating 45°. Of course, in the beginning of such work, they may have been inclined to take delight in "crucifying the flesh," and readily worked under many inconveniences, no doubt; but as time went on they not only sought to relieve themselves from useless pain, but also came to look with much favor and approval on whatever made their work easier and gave them better means of doing it more beautifully. It is not probable that the slant of the writing boards and desk tops used then grew out of any desire to take an awkward position. The pictures they left of their desks indicate very plainly that at this time they sought a slope which would enable them to do their work with the greatest comfort and skill. No one can study with any degree of carefulness the wonderfully illuminated books and manuscripts preserved from the half century prior to the invention of printing, without realizing that those who made them wrought for the glory of God, and the delectation of humanity

A Monk in the Scriptorium.

through truth and beauty, rather than through the desire to set tasks for themselves or devise means of torture and pain. After a good deal of time spent in going over such manuscripts and illuminations, no evidence can be found that writing on desks at the slant they came to use was awkward or irksome. If the reader wishes to assure himself on this point, he will find a number of illustrations in John Willis Clark's book, *The Care of Books*, bearing on this point. Note the slant of the board upon which the writing is done, the distance of the eyes from the work, the direction of

the line of sight, the weights designed to hold the parchment not in use, position of the ink-horns showing the use of the right hand, the near position of the bottom of the board, the string at the left for holding the board and adjusting its slant, and the width of the board. A scribe so conditioned could not do his work without sitting fairly erect; and this, to my mind, is the only solution to the problem of securing correct postures in school children; we must so condition them for their work that they cannot do it without maintaining good posture. Doubtless objections will be urged against taking this Middle Age document as a guide, for it will be said, and said truly, that the writing of that time was more in the nature of printing by hand or painting with a pen, as an artist draws and paints with a brush, than a cursive handwriting. The fact remains, nevertheless, that these copyists and illuminators worked out a slant for a writing desk to suit the demands of their work and the hygienic posture of their bodies. There is but little doubt that, if adults were compelled to go to school to-day, and required to work as children work, it would be but a short time until school desks would show great improvement. As long as children sit at them it is, for most people, easier to let them alone and go on in the "good old way." The discussion of the desks used by the monks of olden times, and the illustration accompanying it, have been introduced for the purpose of suggestion and comparison, rather than as direction and guidance; but when the ideal hygienic desk top is made, it will be at an angle not appreciably smaller than that represented.

Put briefly, the essential requirements of convenient and properly constructed desks are as follows: (1) They should be single, that is, made to accommodate one pupil. (2) The seats and desks should be separate, so that the movements of one pupil would in no way disturb another, and also that each pupil may have both seat and desk adjusted to his individual needs. (3) Both desks and seats should be so constructed as to be readily adjusted to the specific individual needs of the pupil. (4) The desk should be provided with a box to receive all books and supplies, and keep them free from dust. The open shelf under the desk top is not satisfactory. (5) The box for books and supplies should in no way interfere with the movements or easy posture of the pupil while seated. (6) Both desk and seat should be strongly constructed, so that when fastened to the floor, they will be firm and steady. (7) The supports and braces of the desk should be so arranged as to give free and easy movements of the pupils' feet without bumping. (8) Those desks so constructed as to offer the least interference to cleaning or polishing the floor are, other things being equal, to be preferred. (9) The desk top ought to have a much greater slant than now given, in accordance with the reasons given

in the preceding discussion. (10) Both desks and seats should be adjustable in all parts as to height, position, shape, and slant. (11) The desk should be so situated with respect to the seat that the lid of the desk should overhang the seat two inches at least. (12) Each child in the grades should be measured sitting and standing at least twice or three times during the school year, in order to make adjustments as frequently as needed. (13) Desk tops should

Adjustable Chair Desk with Lifting Lid.

Adjustable Chair Desk with Open Box.

be without high polish and of a color which will not reflect too much light into the eyes of the pupils. A color which will give an easy contrast with the pages of a book will meet this requirement. (14) Seats and desks should be strong, simple of construction, and easily cleaned, and so finished that the use of disinfecting materials will not harm or blemish them. (15) Seat boards should be wide enough to comfortably accommodate the pupil, but no wider. (16) On the

whole, where single desks are used, there is less noise and trouble with seats in the form of chairs than in the form of benches. It is better, too, where single desks are used to have children stand in aisles to recite than to turn back a hinged seat and stand behind his desk. With a properly constructed chair and desk, plenty of room is given for him to get in or out without trouble or disturbance. (17) The chair back should be adjustable to the changes in the curve of the back, especially of adolescent girls, as noted in the discussion above. (18) The back of the seat should reach nearly to the shoulder blades when the pupil is sitting properly, and should never be higher. Most school seats err in this regard. (19) There are some distinct advantages in the style of German desks illustrated which permit pupils to stand while working, so as to get a restful change of position. (20) Desks made with the slant suggested must have a slight ledge near the inner edge to keep books from sliding off. A groove near the outer edge is needed to retain pencils and pens. (21) A chair or bench with a solid back is better than one with spindles, or open boards.

**DES MOINES COLLEGE, DES MOINES, IA.** -- A coeducational institution founded in 1865, and under Baptist control. Preparatory, collegiate, educational, musical, and commercial departments are maintained. Fifteen units of high school work are required for entrance.

Admission is by examination or on certificate from an accredited school. The course in the department of education leads to the first-grade state certificate. There are nine professors and twelve instructors on the faculty.

**DESTRUCTIVE CRITICISM.** -- See SUPERVISION OF TEACHING; CRITICISM, THE FUNCTION OF EDUCATIONAL.

**DETENTION.** -- One of the means of punishing children at school is to deprive them of privileges. Detention from play and other dispositions of child leisure is one form of punitive deprivation. Detentions are usually of two sorts: (1) detentions from play at recesses or other intermissions, and (2) detentions after school. Owing to the increased appreciation of exercise, fresh air, and recreation as factors in the health of children, detentions are less used than before. Detentions for failure in school work are more and more infrequent as teachers realize that such shortcomings are not primarily matters of moral laxness to be overcome through punishment. The imposition of work from the school studies as a means of keeping the child busy during detention is likewise decreasingly justified by teachers, inasmuch as it tends to create a hostility on the part of the child toward the subject thus used.

See REWARDS AND PUNISHMENTS; SCHOOL MANAGEMENT.

**DETENTION SCHOOLS.** -- A term sometimes applied to schools for delinquents (*q.v.*), but more properly to classes formed for children who are awaiting trial or being held as witnesses. In the New York City jail ("The Tombs") such classes have been maintained for years by philanthropic individuals. The children confined there have usually had poor educational advantages, and since the opportunities to do effective teaching in the jail are good, some of the teaching has produced unusual results. With the development of suitable machinery of oversight and probation in connection with the Juvenile Court (*q.v.*), the older fashioned detention school will doubtless disappear.

**DETERMINANT.** -- A device for representing certain types of algebraic expressions in a contracted form. Thus the determinant

$$\begin{vmatrix} a & b & c \\ a' & b' & c' \\ a'' & b'' & c'' \end{vmatrix}$$

stands for the expression  $ab'c'' + a'b''c + a''b'c' - a''b'c - a'b'c'' - a'b''c'$ , and is a much shorter way of representing it. A determinant with two terms on a side is a determinant of the second order. The one above given is of the third order. Determinants may be of any order  $n$ , where  $n$  is a positive integer. There are

simple methods for expanding determinants, as may be seen in higher algebras or in treatises upon this special subject. Determinants are used to advantage in solving sets of linear equations involving a considerable number of unknowns. They are also often helpful in analytic geometry and in higher analysis. At present there is a little tendency to use the notation in elementary algebra, but it gives slight promise of success, owing to the abstract nature of determinants. The theory began with Leibnitz (1693). Vandermonde (1771) first treated determinants as an independent theory. Lagrange (1773) and Gauss (1801) did a great deal for the perfecting of the theory. Jacobi (1827) was one of the greatest writers upon the subject, and to him is due the final acceptance of the term "determinant." The general idea is also found in the writings of the Japanese scholar, Siki (seventeenth century), and a primitive treatment is seen in the writings of the Chinese in the twelfth century. D. E. S.

**DETERMINISM.**—The general doctrine which teaches that the human will is controlled beyond the possibilities of arbitrary individual choice. Determinism is opposed to libertarianism. According to libertarianism the individual is free to decide at any moment without further motive than his choice between alternative ends. According to the doctrine of determinism, the individual is determined in his choice by his past experiences and the present situation. There are two possible interpretations of this doctrine. The first would teach that the individual is controlled in his choice by external influences, especially by his present sensory impressions. This type of the doctrine is not widely held at the present time. That the individual is determined by his inherited organizations and by the habits which have been developed in the course of his individual life is very generally held. Sometimes the doctrine is modified so as to recognize the possibilities of new forms of combination at certain special periods of life. These special combinations are sometimes called variations in behavior. The whole discussion has historical importance because of its bearing on the general doctrine of the freedom of the will (*q.v.*) and the relation of this doctrine to education. It has been held that unless the child is free to follow his own choice it is futile to try to influence him through any appeals to his intelligence. On the other hand, it is pointed out that if education is to be finally effective it must depend upon the assumption that the individual can be determined in his future conduct by his present training.

Whatever the difficulties of the doctrine of freedom, there are certain undeniable facts

which relieve the educator of embarrassment in connection with the philosophic controversy of determinism *vs.* indeterminism. These are plasticity, or the modifiability of disposition and character; the function of reflection and deliberation in emancipating the agent from servility to blind impulse and chance circumstances; and the persistent tendency of well formed habits.

**DEUTSCHE LANDERZIEHUNGSHEIME.**  
 —A type of private boarding schools developed very recently in Germany, growing out of, or strongly influenced by, the experiments at Abbotsholme (*q.v.*) and the practice school at Jena. They have been built up by Dr. Hermann Lietz. Many intelligent parents have welcomed a movement in which a more realistic program is followed and more attention is paid to physical development and to the fundamental activities of social relationships and of industry. In the *D.L.E.H.* boys of several social grades meet on a plane of social equality, and thus an opportunity is given for natural excellence to receive more adequate recognition. The general atmosphere of the school is one of a rare *Gemütlichkeit*. These schools are of importance in forwarding the movement toward more democratic education. (See BOARDING SCHOOLS.) Professor Münch, in *Zukunftspädagogik*, and Professor Paulsen, in *German Education*, refer to the schools, and consider their extension probable and desirable.

The *Schulreise* has not been neglected; the neighboring states are visited, and longer trips are made to Italy and Greece. These schools

are more completely to themselves than are those in the other countries. There is an almost entire absence of woman's influence, and the culture epoch idea that a boy's most significant education comes from companions of his own years results in three widely separated schools, thus carrying education by contemporaries to a logical conclusion. Religious education retains a prominent place in these schools, and is worked out on a very intelligent and suggestive basis.

**DEUTSCHE WALLACE KOLLEGIUM UND NAST THEOLOGISCHES SEMINAR, BEREÄ, OHIO.**—A coeducational institution, founded in 1861, maintaining preparatory, collegiate, musical, commercial, and theological departments. The college courses, classical, scientific, philosophical, and literary, which are based on about twelve points of high school work, lead to their appropriate degrees. Much of the instruction is given in German. Students who hold college degrees are admitted to the theological course, which leads to the degree of Bachelor of Divinity. The teaching staff numbers over twenty.

**DEVELOPMENT.**—During the latter part of the eighteenth century, "development" became the watchword of educational reformers. The primary assumption of the liberal school of thought all over the continent of Europe was the essential harmony of nature and the needs and satisfaction—the happiness—of man. The reaction against supernaturalism that came in with the Renaissance resulted in the Enlightenment in a virtual substitution of nature for revelation. By its own intrinsic workings either Nature (*q.v.*) as a uniform law-abiding instrument of a benevolent Deity, or else as itself a sort of beneficent God was the final principle of order and simplicity or system, and, hence, of well-being.

In the seventeenth century, Newton had reduced physical nature to a comprehensive rational order effected by the balancing of two ultimate forces, and Locke had accomplished a parallel task for human nature. Leibnitz had introduced the notion of an absolutely detailed and complete (because pre-established) harmony of spirit and matter, man and nature, reason and morals. France, especially under the leadership of Voltaire, made a popular combination of these various notions. "Nature" became the norm of all that was orderly and rational, the weapon of criticism of all that was artificial, arbitrary, and capricious. Since human nature was included in the scope of nature, it, too, had its own operations and laws, wholly independent of civil institutions, traditions, and customs.

Hence there were two types of education possible, one artificial, which perverted nature by making persons conform to arbitrary external conditions; the other natural, consisting in the unfolding or development of the intrinsic forces of the human being. While France elaborated especially the negative and critical side of this doctrine, German thought worked out a theory of the various natural faculties or powers of the soul, and the supposed laws of the order and manner of their unfolding. Indirectly, at least, this movement was due to the influence of Leibnitz, who had taught that all ultimate or true substances—including the soul—are self-contained centers of energy; had denied that they can exercise any influence on one another; and had, therefore, accounted for all the phenomena of change as simply making explicit what was already implicit in the substance itself. This process of external manifestation of intrinsic capacity he termed *evolution*, it being an axiom that nothing could be evolved except what was already *involved*. Applied in education, this conception was, of course, totally hostile to all theories that conceived education as a bringing to bear of external forces upon the mind. True education was simply to supply such conditions as would enable the soul to unfold in its own orderly sequence its own inherent powers. This conception was finally summed up in the definition of education that became a classic in the early nineteenth century: Education is the complete and harmonious development of all the human faculties, moral, intellectual, physical, and æsthetic.

The development of psychological and social science in the nineteenth century showed that there is no such thoroughgoing harmony of nature and humanity as was implied in this conception of education. The tendency of the industrial development was not to institute final peace and good will among men, but to emphasize class antagonisms and to create new causes of discord between nations. Nevertheless, the whole tendency of biological science was to retain the notion of development as one of fundamental importance in education as a notion which, negatively, contrasted with cramming and passive absorption, and, positively, put the idea of normal growth in the foreground. The contemporary notion of development differs from the older notion in two respects. First, it insists that development must be measured from the standpoints of specific ends to be attained. There is no development at large or unfolding in general going on. There are many ends undergoing realization through gradual growth of the means adapted to them. Since the ends of action are social, this interpretation does away with the isolation of individual powers implied in the older definition. Secondly, the positive necessity of a favorable environment to secure development is recognized. It is not

enough to eliminate arbitrary and perverting conditions; growth cannot go on in a vacuum. As the body requires air and food, so mind and character require a culture medium in order to develop. Development, in short, has become a notion which, on one side, emphasizes the native and spontaneous existence, in the one educated, of the fundamental and initial factors of education, while, on the other, it emphasizes the social nature of growth as an aim and the necessity of social conditions in order that growth may be in the right direction.

J. D.

**DEVELOPMENTAL LESSON.**—See **TEACHING, TYPES OF.**

**DEVELOPMENTAL METHODS.**—The method of development in teaching is a mode of teaching through which the pupil acquires most of the desired facts through his own activity rather than through the statement of teacher or author. These facts may be of varied sorts, including concepts, judgments, generalizations, inferences, definitions, laws, rules, and principles. Developmental teaching is usually contrasted with the method of instruction. In the one case, the teacher leads the child into knowledge; in the other, the instructor tells or states the fact more or less authoritatively. From the standpoint of the learner, the developmental method gives a direct experience, while the method of instruction starts from another's exposition of an experience, the child getting it indirectly, second-hand, as it were. From the standpoint of the teacher's activity, the developmental method is an indirect method of conveying the fact from the teacher's mind to the child's mind, while in instruction, the teacher tells the fact direct to the child, without the interposition of concrete experiences, judgments, and reflections as a basis for the child's own conclusions. In the method of development, the child believes the facts taught primarily because of the evidences within his own possession; in the method of instruction his belief is primarily an acceptance of authority.

The advantages of developmental modes of teaching over those of instruction are: (1) It stimulates the child's initiative and develops self-reliance. (2) It tends to interrelate concrete and abstract knowledge in the most useful ways. (3) It makes the recall of the facts thus learned easier and more certain. (4) It is a transition method between instruction and independent thinking. Its disadvantages are: (1) It is a longer process for teaching a fact than instruction. (2) It is not at all applicable in fields where the concrete fact cannot be revived, as in geography and history. (3) It frequently tends to the exclusion of the legitimate cooperation of the teacher in telling facts and correcting defective generalizations and inferences. The method of development

and the method of instruction are not competitive means of teaching. They are supplementary, each being valuable where the other is least efficient. It will seldom occur that one method is used to the exclusion of the other. In fact, the two methods should be in constant supplementary employment, the practicality of the distinction residing largely in the relative preponderance of one mode of instruction in any given lesson, rather than in its exclusive use. Facts of concrete experience that cannot be reproduced effectively, or at all, under the artificial conditions of classroom life, such as many scientific, geographical, and historical facts, are usually taught by instruction through language, books, and graphic representation. Formal or conventional facts, such as occur in teaching linguistic usages or social manners, are also usually conveyed through the method of instruction. But facts that are of the nature of generalization and inference are usually best presented through the method of development. The concepts of arithmetic, the generalizations of science, the rules of grammar, etc., are of this latter type.

Developmental methods are usually of two types: inductive and deductive. The inductive method of development is utilized in developing general facts from a series of individual facts, as in presenting the number concept from several objective experiences in arithmetic, or in formulating the law of agreement between subject and predicate in grammar, etc. The deductive method of development is utilized in identifying one or more general principles with a concrete case, as in all inferences and applications from general principles in geography, science, civics, etc. H. S.

**DEVENTER.**—A town in Holland, sixty-six miles east of Amsterdam. In the fifteenth century, Deventer was the center of the humanistic movement for Holland and the parts of Germany bordering on it. The Latin School of St. Lebuin, the patron saint of the town, had a European reputation, which was acquired under the headmastership of Alexander Hegius (*q.v.*) from 1483 to 1498. From this school there went out, among others, Erasmus (*q.v.*), Murnellius, and Hermann Buschius, famous among the northern humanists. The school and the town, which, according to a contemporary account by Butzbach (*q.v.*), was famous for the kindness and philanthropy of the citizens, attracted the wandering scholars of the day. A high standard of attainments was reached, and in the upper classes of the school classical work of university grade was done. The school had a long history. After the Reformation it came under the charge of the

town. In the middle of the last century, the title of the school was changed to *Athenaeum*. In addition to the school, the town was also famous for its printing presses, from which a number of classical texts were issued, and as the place of origin of the activity of the Brethren of the Common Life (*q.v.*).

WOODWARD, W. H. *Studies in Education during the Age of the Renaissance.* (Cambridge, 1906.)

**DEVICE, TEACHING.**—In the broad sense, any special method of teaching. In a more restricted sense, a device is a highly specialized artifice of instruction, planned for a very particular purpose. It is usually a simple, concrete, and strategic method of teaching procedure. There are many types of devices, the most important of which are: (1) Formal plans of procedure, special systems or arrangements in teaching, of wide applicability, as the spiral method (*q.v.*) of arranging the course of study so that the maturing child will have repeated and enlarging treatments of the topics or facts previously studied. The Grube method in arithmetic, the synthetic method (*q.v.*) in teaching reading to beginners, the dictation method (*q.v.*) in spelling, are additional examples. (2) Special schemes or devices contrived to develop, drill, or apply the facts of instruction, as, the action work required in the first reading lessons of foreign children, or beginners; here the pupils act out the sentences they have read, the appropriateness of the action being the test of the correctness of the reading. Paper transactions in the teaching of commercial bookkeeping, and the topical method in history, also illustrate this type of device. (3) Particular contrivances, more or less material and mechanical, with a restricted use, such as the abacus (*q.v.*) in arithmetic. Diagramming in grammatical study and the use of graphs in the teaching of mensuration likewise belong to this category.

Teaching devices are usually characterized by their peculiar fitness to particular situations. They are ingenious in their simplicity, readily comprehensible, and easily managed by teachers; herein lies their strength. Their weakness is found in the fact that their use is easily abused by the unthinking teacher. They offer a ready-made concrete method of instruction, which is often carried over into situations where they are inadequate, if not misapplied. Many special systems of teaching which have enjoyed a temporary vogue have been attempts to give wide applicability to a few simple devices, the real applicability of which was limited. Despite the frequent criticism of the use of devices in teaching, it is recognized that they constitute a resource, in the form of concrete instruments and means of instruction, which is invaluable to the teacher. The disbeliever in devices may invent methods anew with each situation, gaining a flexibility and

fitness for each situation, but he will be limited by his own personal resource. Devices, in a sense, represent the fixed institutional habits of the teaching profession; they are means of placing the experience of the teaching profession at the disposal of the individual instructor. The need is not for fewer devices, but for a more versatile series of devices, so as to allow of a large range of choice, and a more discriminating use of particular means. They represent concrete instruments for teaching, each of which has a specialized fitness for some situations, and likewise an unfitness for others. The special one-sided worth of a device always demands that it be used for the realization of a special purpose in a special situation, and not elsewhere. Its very special use should at once prompt its supplementation with other devices and methods. Only in this way can all the interests involved in the proper teaching of a given series of facts be properly conserved. The conventionalized nature of most devices makes them formal. They tend to be used somewhat mechanically, as if the results would come as a matter of course. As they need to be used selectively, they also need to be used flexibly. A little adaptation adds fitness and power to a device, and redeems teaching from mere mechanical routine.

**DEWEY, CHESTER** (1784-1867).—Educator, who was for many years active in the improvement of elementary and secondary education in New York State; was graduated from Williams College in 1806. He was for eighteen years professor of mathematics in Williams College; for ten years principal of the Berkshire Gymnasium at Pittsfield; for fourteen years principal of the Rochester Collegiate Institute, and for seventeen years professor in Rochester University. Author of several essays on education and science.

**DEXTRALITY.**—See AMBIDEXTERITY.

**DIACRITIC METHOD.**—Any special method of teaching beginners to read which employs special marks to distinguish the special sounds or values which letters possess in the pronunciation of words.

See PHONETICS; PHONETIC METHOD; READING, TEACHING BEGINNERS.

**DIACRITICAL MARKS.**—See PHONETICS.

**DIAGRAMING.**—See GRAMMAR, TEACHING OF.

**DIAGRAMS.**—See TEACHER'S AIDS.

**DIALECTIC.**—This term was, in its origin, practically synonymous with logic. Etymologi-

cally connected with "dialogue," its foundation rested upon the efforts of Socrates to introduce definition, generalization and systematic division of topics into discussion especially of moral and political matters, so that its outcome would lead participants into mutual agreement and self-consistency. Later dialectic was generalized by means of the science which had to do with the mutual implications and systematic arrangement of conceptions, definitions, and general principles. As one of the chief agencies of intellectual clarification, Socrates relied upon the development of vague and uncriticized notion into self-contradiction and self-refutation. By combining this aspect of dialectic with Kant's theory of the antinomies, Hegel developed the theory that dialectic is the movement of thought by which every inadequate notion develops into the contradiction of itself as a stage in the evolution of a more adequate conception that reconciles the one-sidedness of both the ideas out of which it develops. In the form of a law of mental development through the reconciliation of opposites, this principle has played considerable part in the modern philosophy of education, especially as an interpretation of Froebel's kindergarten gifts, and also as indicating the necessity of a stage of alienation, or disruption (*Entfremdung*) in the development of childhood into maturity.

**DICKENS, CHARLES** (1812-1870). — Dickens was a reformer as well as a novelist. One of his supreme aims was to free childhood from the tyranny, the injustice, and the wrong methods of training and teaching to which it was subjected. He introduced twenty-eight schools into his novels and sketches, some to expose the weakness of existing methods of training and of teaching, others to reveal new and better methods. He was the first great student and advocate of the kindergarten in England. He published in *Household Words*, in 1855, one of the most comprehensive and appreciative articles yet written on the kindergarten in English. His later works reveal an accurate knowledge of the vital principles of the Froebelian philosophy. His writings did much to arouse a genuine interest in and sympathy with childhood. He aimed to make the child and not knowledge the center of educational efforts and processes. He attacked fourteen types of coercion, and he tried to show that even the gentle but firm coercion of dear old Mrs. Crisparkle was as great an evil in the destruction of individuality, as the harsh and utterly inconsiderate coercion of Squeers or Creakle.

He advocated both in his editorials and in his novels the establishment of free national schools, and he was the chief agent in overthrowing bad

private schools and academies in England, by exposing them in his descriptions of such typical schools as those of Squeers, Creakle, Mrs. Wackles, and Miss Monfathers. He was one of the first in England to plead for the establishment of normal schools for the training of teachers. He made special visits to two great educational leaders in America, — Henry Barnard (*q.v.*) and Samuel Howe (*q.v.*). From the first he learned the value of free national schools, and by the second he was inspired with the enthusiasm he afterwards showed in favor of educating the deaf, the blind, and the defective. His most pathetic story, *Dr. Marigold*, aroused deep interest in the training of the deaf; and Caleb Plummer's daughter, in the *Cricket on the Hearth*, awakened sympathy for blind children in all civilized countries. *Barnaby Rudge* led humanity to take an interest in feeble-minded children, and Poor Jo aroused the British people, and led to the opening of schools for the neglected children in cities and towns.

Dickens advocated the teaching of music, art, and manual training in elementary schools. He made an exposure of every possible kind of " cramming " in *Dombey and Son*, *Hard Times*, and *Mrs. Lirriper's Lodgings*. He discussed the special evil of working a child beyond the " fatigue point " in his article on the schools of the Stepney Union.

He pleaded for a free, real childhood in nearly every book he wrote, especially in *Hard Times*, *Dombey and Son*, *The Tale of Two Cities*, *Bleak House*, *Martin Chuzzlewit*, and *Mugby Junction*. The need of the fullest development of the imagination is clearly revealed and intelligently discussed in *Hard Times*. In the preface to the first number of *Household Words*, Dickens stated that one of the reasons for publishing the magazine was to aid in developing the imagination of the children. The importance of developing the individuality of each child was made prominent in *Hard Times*, *Our Mutual Friend*, *Dombey and Son*, *David Copperfield*, *Bleak House*, and *Martin Chuzzlewit*. Physical training and the great importance of proper nutrition were urged in *Dombey and Son*, *David Copperfield*, *Nicholas Nickleby*, *Oliver Twist*, *Great Expectations*, and *Edwin Drood*.

Dickens understood clearly the ideals of the new education, and by revealing them incidentally in his novels, he influenced a much larger audience than he could have reached if he had written treatises on education.

HUGHES, J. L. *Dickens as an Educator*. (New York, 1901.)

**DICKINSON COLLEGE, CARLISLE, PA.** — A coeducational institution, and the second college in the state, chartered by the legislature of Pennsylvania, Sept. 9, 1783. Established on what was then practically the frontier,

Dickinson was the first college founded to meet the needs of the population in the new West. The name was chosen in recognition of the services to the United States, and the "very liberal donation" to the college of John Dickinson, Governor of Pennsylvania, the author of the famous *Letters from a Pennsylvania Farmer*. In its early years the college was occasionally aided by the state. Placed in a Presbyterian community, most of its earlier presidents and trustees were members of that denomination. The original charter provided that the successors of the thirteen clerical trustees should also be clergymen, but this direction was repealed by an act of 1826, whereby it is provided that "not more than one third" of the trustees shall at any time be clergymen. Since 1890, the Board of Trustees consists of fifty members, four elected by the alumni. In February, 1907, the Board of Trustees passed resolutions declaring that "Dickinson College is under the friendly auspices of the Methodist Episcopal Church, but has never been owned or controlled by any church body." In the same year, the college was accepted by the Carnegie Foundation for the Advancement of Teaching (*q.v.*) as a non-sectarian institution participating in its system of retiring allowances to professors. In 1890 a school of law was erected as a part of the corporation, and the degree of Bachelor of Laws, which from 1834 to 1882 had been conferred upon the graduates of a private law school existing under the general patronage and supervision of the college, was formally recreated. This school is controlled by a self-perpetuating Board of Incorporators of fifty-five members. In addition to the degree of Bachelor of Laws, the college confers in course the degrees of Bachelor of Arts, Bachelor of Philosophy, Bachelor of Science, and Master of Arts.

The record of Dickinson's alumni is remarkable. With Princeton and Bowdoin, Dickinson is the only other American college possessing the distinction of having graduated in arts both a President of the United States and a Chief Justice of the Supreme Court. The list of other Federal judges, of members of state judiciaries, and of governors of states is surprisingly long, while it is doubtful if any educational institution of a similar size has furnished to its country as many as nine cabinet officers, ten members of the highest legislative body, and fifty members of the Lower House. In addition, the legislature of Pennsylvania began very early to contain a large number of Dickinson graduates.

Grounds, buildings, and equipment are valued (1909) at \$501,000. The total productive endowment is \$378,868; the annual income is \$22,240. Tuitions and fees from students amount to \$69,465. The total annual income is \$62,076. There is an outstanding debt of \$153,667. The average salary of a professor

is \$1700. There are nineteen members on the instructing staff in the college, of whom fifteen are full professors; in the law school the instructing staff numbers seven full professors. The enrollment in 1910-11 was 428, of whom 351 were in the college and 77 in law. C. G.

**DICKINSON, JOHN WOODBRIDGE** (1825-1901).—Schoolman; educated at Williston Seminary and Williams College, graduating at the latter institution in 1852. For the next twenty-five years he was connected with the State Normal School at Westfield, Mass., and from 1877 to 1894 he was secretary of the State Board of Education in Massachusetts. He wrote a history of education in Massachusetts, and numerous papers on the art of teaching. W. S. M.

**DICKINSON, JONATHAN** (1688-1747).—The virtual founder of Princeton University, and its first president; was graduated at Yale in 1706. Author of *Familiar Letters to a Young Gentleman* (1745), and of numerous theological essays. W. S. M.

HAGEMAN, J. F. *History of Princeton and its Institutions*. (Philadelphia, 1879).

**DICTAMEN**.—The term applied in the universities of the Middle Ages to composition in prose and verse indifferently. It included not only the study of the rules of prosody, but of all kinds of prose composition, letter-writing, legal documents, and official correspondence. It thus formed an important part of the general education of the law student at Bologna, and several important works on the art of dictamen appeared at this university, for example, Irnerius (*q.v.*) wrote a notarial form book (*formularium tabellionum*). Bernard Silvester of Tours (*q.v.*) composed a work in verse on the writing of Latin letters. Generally the art of dictamen formed part of the study of rhetoric, but at Orleans it became "almost a distinct faculty," and the master of the school came to be known as *magister in dictamine*.

**DICTATION, METHOD OF**.—A special form of classroom exercise, in which the teacher tells or reads a series of sentences which the children are to write down. It is a method for testing or drilling the child's command of details as used in context. In penmanship, after the child has mastered parts of letters, letters, and words, the work is supplemented by rapid writing from dictation so as to make the practice in penmanship more nearly normal. A more frequent use of this method is found in the teaching of spelling. Here the old word list

method is supplemented by sentence or paragraph dictation, where the attention is likely to be divided between meaning and form in a natural manner. Dictation is sometimes used in the teaching of composition, though its value here is much more restricted. The method of dictation is a special form of the contextual method.

H. S.

See CONTEXTUAL METHOD; SPELLING, TEACHING OF.

**DICTIONARY.**—A collection of words, commonly a general vocabulary, arranged in some kind of alphabetic order with a statement under each word of information as to its spelling, pronunciation, meaning, or etymology. Most of our larger dictionaries give information on all these subjects, and most of our smaller ones on spelling, pronunciation, and meaning. The term "dictionary," however, is used of various other classes of alphabetic vocabularies, and more loosely of works having subjects treated under brief titles arranged in alphabetical order, as in Bible dictionary, architectural dictionary, etc. (For the principal works of this kind, see ARCHITECTURE, ECONOMICS, ENCYCLOPEDIAS, etc.)

The modern general English dictionary has its immediate origin in the word lists or vocabularies of the fourteenth, fifteenth, and sixteenth centuries. The earlier lists, of which the *Catholicon Anglicum* is the most notable, were mainly lists of words in foreign languages with their English equivalents. The first list of English words with English definitions was *A Table Alphabetical of Hard Words*, published in 1604 by one Robert Cawdrey. The first to assume the title of *English Dictionary* was that commonly called Cockeram's dictionary, published in 1623. The chief dictionaries to appear between this and the publication of Johnson's dictionary in 1755 were: in 1656, Blount's famous *Glossographia*; in 1658 Phillips's dictionary entitled *The New World of Words*, largely based upon Blount; in 1677 *Schoolmaster Cole's English Dictionary explaining the different terms that are used in divinity, husbandry, physic, philosophy, law, navigation, mathematics, and other arts and sciences*; in 1717 Bailey's *Universal Etymological English Dictionary*, which was chiefly devoted to technical terms of the arts, trades, and sciences, and was the first to give reasonably full etymologies. Bailey also was the first to introduce the stress accent for indicating the pronunciation of words. Benjamin Martin, in his dictionary published in 1749, indicated the number of syllables, and by the use or omission of accents indicated the quantity of many long and short syllables.

Johnson's dictionary, with which modern English lexicography may be said to begin, appeared in 1755 in two large folio volumes entitled *A Dictionary of the English Language in which all words are deduced from their originals, and are illustrated in their different classifi-*

*cations by examples from the best writers.* The chief distinctively new features introduced by Johnson were the use of illustrative quotations and a more accurate and thorough analysis of the senses of words and phrases. The book was as pronouncedly literary in its character as Bailey's was technical. Between the publication of Johnson's Dictionary and the first edition of Webster's in 1828 many minor dictionaries were published. The most notable of these were the pronouncing dictionaries of Kenrick (1773), Walker (1791), Perry (1775), Sheridan (1780), most of whom were actors or elocutionists. Walker's dictionary became very generally accepted as an authority, and ran through thirty or more editions before it was finally supplanted by Webster's dictionary. Smart published, first in 1836, an edition of Walker, entitled *Walker Remodelled: a new Critical Pronouncing Dictionary*. James Buchan, in his dictionary published in 1757, was probably the first to indicate the full pronunciation of the vocabulary words.

Webster's first dictionary was a small octavo book published in 1806, and this was followed (1828) by his *American Dictionary of the English Language*, to the preparation of which he devoted twenty years of zealous work. Webster treated lexicography as a science as well as an art; he emphasized its historical character, and gave a new importance to the etymologies; he covered both literary and technical terms; he first divided words so as to indicate to the eye, as nearly as might be, the true pronunciation; he recognized the viciousness of the conventional spelling of many English words, and adopted various simpler spellings which he considered to be justified by the analogies of the language, such as those with the endings, *-er, -ic, -or, -ize*, instead of those with *-re, -ick, -our, -ise*. Webster himself published also the second edition of his work in 1840; but the next edition, that of 1847, was brought out by a publishing house which has continued the revisions in an unbroken series, each based upon the next preceding edition, these revisions consisting of: the *Unabridged* of 1864; the *International* of 1890, and the *New International* of 1909, with various intermediate editions, under the same titles, having new matter in the form of appendices or supplements.

Since the publication of Webster's dictionary in 1828, various other important dictionaries have been made. The dictionary of Charles Richardson, published in 1836, was an original work very valuable for its abundant quotations from standard English authors, which constituted the chief distinction of the work. About 1850 was published *The Imperial Dictionary of the English Language*, edited and largely written by John Ogilvie, a Scottish schoolmaster, who took Webster's book as his basis, but added to it very extensively, giving the work a somewhat encyclopedic nature. From 1889 to 1891, the *Century Dictionary*, with William D. Whitney as

editor-in-chief, was published in parts appearing at short intervals. This in turn was based upon Ogilvie's dictionary, and carried its encyclopedic features still further. Joseph E. Worcester, who was trained in lexicography by Webster, compiled various small dictionaries between 1830 and 1859, in which year his quarto dictionary was published. This, for a time, disputed the field with Webster as an authority on the pronunciation of words. No revision of this book has been published, but an edition with a considerable supplement was published in 1881. The *Standard Dictionary* was originally published (1893-1895) in two consecutively appearing volumes. This work was begun with the plan of using the 1847 Webster as its basis; but later this plan was given up; the historical treatment of words was abandoned; the etymology reduced nearly to Johnson's brevity; and citations from classical English authors were replaced with quotations from more modern, though often less careful writers. Hunter's *Encyclopedic Dictionary* (1879-1888) is a large work of an encyclopedic nature, edited, and largely written, by Robert Hunter, a Scottish author. This work contains an ill-digested mass of material, and is chiefly valuable for its suggestiveness.

In 1884 appeared the first section, or part, of the Oxford English Dictionary, entitled *A New English Dictionary on Historical Principles*, which all-in-all is the greatest dictionary ever published in any language. This work, which is founded mainly on material gathered by the English Philological Society, has been edited by Sir James A. H. Murray, assisted in the later parts by Dr. Henry Bradley and by William A. Craigie. It is almost purely philological and literary in character, giving exhaustive information as to etymologies, and often as to pronunciations; the senses are minutely analyzed and treated according to their historical development, with a multitude of citations dated and referred to their sources by page, author, and book title.

Besides these general dictionaries, there are various special etymological or dialect dictionaries, of which Rev. W. W. Skeats's *Etymological Dictionary of the English Language* (1898) and Dr. Joseph Wright's great *Dialect Dictionary* (completed in 1905), are too important to be passed over without mention.

The dictionaries of Webster and preceding lexicographers were practically one-man compilations. Webster defined all the terms in his dictionary himself, made or compiled the etymologies, and indicated the pronunciations, with only occasional assistance obtained from others and the help of the few paid assistants who were little more than copyists. This was also true of preceding lexicographers. To-day, no general dictionary worthy of any credence is made in this way or by general revisers alone.

**The Dictionary as an Authority.** — Much has been said and written about the credibility

of the dictionary, and for and against accepting it as a final authority in disputed questions. The modern unabridged dictionary, made by a corps of trained editors and specialists, is nearly always correct so far as it goes, though it may likely enough fail to record all the facts about a particular question. Some mistakes are inevitable in any such work; but care and repeated verification have reduced the chance of error to a minimum. In matters of opinion, however, dictionaries may differ more or less, according to the light that the editor had in deciding the matter in question, or according to the standard adopted by him in making his decisions, as especially in pronunciation and spelling. Thus, if the dictionary gives a certain pronunciation for a word, it is morally certain that that pronunciation is used by a certain portion of the better educated people; but whether this particular pronunciation is the best pronunciation is a matter of opinion, depending upon what is accepted as the best usage. The same is true of any particular spelling of a word that has more than one spelling in good or reputable usage. In these matters, therefore, some one or more books must be chosen as the standard, or standards. But even in matters of opinion, the editor of a dictionary who is specially trained in his work and has at his command special information is exceptionally qualified to decide intelligently and correctly. Therefore, where two different works in good standing give the preference to different spellings, or to different pronunciations, the fact probably is that both these works record reputable usage. There is, however, a decided convenience in accepting some one book as final authority either for class instruction or for one's own personal guidance. See ENGLISH USAGE; SPELLING.

**The School Use of Dictionaries.** — With respect to the large, or unabridged, dictionaries, the same qualities that fit them for general use also fit them for school use. Such a dictionary, to be the most useful, should give in the most easily accessible manner whatever information about words, or phrases, or names, that is needed by a person to use the word, phrase, or name correctly, or that is needed by a reader or hearer to understand best the context in which it occurs. The qualities of such a work are: accuracy, clearness, aptness, and fullness of information; and fullness of vocabulary. The most important of these qualifications, and the most difficult for any one but a trained dictionary worker to judge of, is accuracy.

A large or unabridged dictionary may be made by a corps of trained dictionary workers and specialists; or it may be made by liberal copying from works now in large part obsolete and often erroneous, such as the early (1828 or 1847) editions of Webster's dictionary, Ogilvie's *Imperial Dictionary*, or Hunter's *Encyclopedic Dictionary* mentioned above, both of which works have been liberally used, without credit,

in this way in the making of various dictionaries now on the market. Neither teachers nor boards of education ordinarily can make the examination that will detect this; and no one can have the universal information that will, without investigation, enable detection of inaccuracies and general out-of-date-ness which become so glaring when investigation has been made. A few up-to-date definitions and a colored plate here and there easily lend a deceptive appearance of thoroughness and accuracy. It may safely be said, however, that any unabridged dictionary reliable as accurate must now be made by a corps of men trained in dictionary work, cooperating with a body of scientific specialists who define or revise all the terms in their respective departments. Any unabridged dictionary, therefore, is without the primary requisite of accuracy if its technical terms are defined by general revisers rather than by specialists. If in any work all the terms in the several sciences have been revised by specialists, it is safe to assume that that fact will be stated, and the names of the scientists given; and it is equally safe to assume that when this is not done the work has been made by copying other, usually obsolete, publications.

Clearness is essential in the typographical form as well as in the presentation of the subject matter. The type impression should be clear, and the symbols used easily intelligible to the average pupil. The typographical arrangement should be simple, so that the pupil will know where to look for a term. A feeling of uncertainty as to whether a word or phrase will be found in one place or another is often sufficient to deter a child from looking up its meaning, though he should have done so to prepare his lesson properly. The form of statement in the definition should be clear, and not involved. In this respect verbiage, as well as distinctions not involving a material difference in meaning, tend to confuse the student.

Encyclopedic information which is closely connected with the meaning of a word is an advantage to the more advanced, and often renders clear a definition which could not be briefly and clearly expressed without it. Many terms that are looked up have some special application or relation, the statement of which, though encyclopedic, is the main thing for which the dictionary is consulted. Such information, when not properly separated from the definition itself, may result in confusion. Under this head may be included the kind of information given in synonyms. Such matter cannot usually be incorporated into the definitions; but it is one of the important functions of the larger, especially of the unabridged dictionaries, to furnish such information.

The size of the vocabulary or number of terms defined in a dictionary is of great importance up to a certain limit, beyond which it becomes a matter of relatively minor consideration. It is quite important that the large dic-

tionary should contain all of the words that are likely to be looked for; and if it can be made to include more than these, so as to meet practically every call made upon it, that is a decided advantage, if other essentials are not sacrificed. The one-volume dictionaries are practically limited to their present size, and further enlargement of the vocabulary is necessarily accomplished by various methods of condensation in typography, definition, etc.

Any teacher can satisfactorily determine the questions of clearness, aptness, and fullness of information, and of size of the vocabulary, by a word-for-word comparison of one dictionary with another. In fact, such a method carried far enough will determine, as well, the relative accuracy of two books, if the differences noted are carefully investigated.

The smaller dictionaries best suited for school use must differ somewhat from those best suited for general use. The small school dictionary must contain definitions that will be brief enough to admit of the book's being kept within a certain size, limited by the matter of price, and yet must be plain and full enough to convey the general idea of the meaning of the terms defined to an immature pupil ignorant of their meaning. Definitions that would answer well enough for the pocket dictionary for general use often will not answer as well for the smaller school dictionaries. Etymologies also are of more importance in some of the smaller school dictionaries than they would be in a dictionary of the same size for general use. Aside from these considerations, the same qualities are to be demanded as in the unabridged school dictionaries. The character of any small dictionary may be readily determined by a careful examination and comparison with a trustworthy unabridged dictionary.

The use to which a dictionary should be put in school depends largely upon the advancement of the pupil. The subject matters concerning which information is sought in the school dictionary are: spelling, pronunciation, meaning, and etymology. The goal that should be aimed at is to have the child know with fair exactness the meaning of every word used in his lesson of the day, either in the book or in his own presentation of it. For the primary grades this is, of course, impossible. Every young child has a general idea of the meaning of many words which he uses constantly, and yet he is unable accurately to state their meanings. To compel such a child look up every word used of which he could not tell the meaning would delay his progress in study, and burden his mind with a mass of definitions which he will better acquire more slowly. Real definitions of these words would usually involve the use of other words with senses unknown or uncertain to him, and the statement of ideas which he would be unable adequately to comprehend. In the primary grades, therefore, reference to the dictionary must be mainly for in-

formation as to the spelling, or the pronunciation, or to get such a general sense of a word as is conveyed by a simple synonym or a brief (though inadequate) definition. In other words, the meanings of difficult words must be merely translated into simpler ideas. With the advance in studies a dictionary with fuller and more precise definitions is needed. The pupil's vocabulary has grown so that he is able to grasp a more accurate analysis of the sense of a word or phrase. He is also beginning to understand the fact that words grow or develop from other words. Here some explanation from the teacher will be of assistance. The literal etymological sense of a word may be such as to throw light on the sense in which it is used, or may be of lively interest as suggesting some character of the thing named. The pupil still further advanced, the high school boy or girl, is learning from his books that man's history is not only a long one, reaching back into antiquity, but that the ideas and customs and doings of our present day are closely affected, indeed, often determined, by what previous races have done and been. In other words, he is developing a sense of the meaning of history. Here the dictionary may be made a real help in furthering this development, which is slow enough at best. The teacher may point out that the English vocabulary is polyglot, recording the influence upon the English people of the races with whom they have come into contact. Then the etymology of a word becomes a thing of real interest, not the technical etymological changes that have taken place (though these may, too, have such interest), but the general historical sense of the word. So the historical treatment becomes of importance. The fact that the language has changed and developed along logical lines in the past may be made plain by pointing to the history of the sense development of the words. Innumerable things of real interest present themselves. These things will not be seen unaided, but a hint here and a help there will arouse in most pupils an unflinching and lively interest in the language which they use. Even the studies in which they are engaged consist largely in the learning of the meanings of words, and the relations of these meanings to each other, as in rhetoric, grammar, arithmetic, botany, chemistry, geology, etc. The history and meanings of terms, then, is a stepping stone to the history and meaning of the great movements of the human race in time.

But it is not words alone of which the scholar may learn the significance in the dictionary. Historical events and characters get conventional names: Berlin Decree, Thirty Years' War, Ecumenical Councils, Holy Roman Empire, Ausgleich, White Russians, Little Englanders, etc. If the "dictionary habit," when acquired by a student, means only the satisfaction of his curiosity as to the meanings of this word or that, it is of but trivial importance. If it means to

him the acquisition of a knowledge of the meanings of words and names, and of the relation of these meanings to each other so as to enable him best to understand the exact and full significance of English literature, he has acquired an invaluable accomplishment. There are, however, few pupils who will do this without material aid and guidance by the teacher.

F. S. A.

**DIDACTIC METHOD.** — The method of instruction, as contrasted with the method of development (*q.v.*). More particularly, that method of moral education, which attempts to teach morality through direct ethical instruction, as opposed to indirect and incidental moral training. The didactic method lays its main emphasis upon precept, principle, doctrine, and rule, rather than on example, habit, etc.

See DIRECT METHODS OF TEACHING; INSTRUCTION; MORAL EDUCATION.

**DIDACTICS.** — The science or art of teaching. In the seventeenth century, there was a general search, in philosophy, science, and education, for some one single, comprehensive method which could be substituted for the empirical variety of rule of thumb methods perpetuated by tradition and custom. Largely through the influence of Comenius (*q.v.*), the term "didaectics" was introduced to designate the one method as manifested in teaching. In this country, the term "general method" has come into common use as a substitute for the term "didaectics." In Germany, where the terminology of pedagogical theory has been highly elaborated, especially in the Herbartian school, the term *Didaktik* is employed to designate one division of the many fields into which pedagogy in general is subdivided. J. D.

See METHOD, GENERAL; PEDAGOGY; PHILOSOPHY OF EDUCATION; METHODS, TEACHING.

**DIDEROT, DENIS.** — Born at Langres, France, in 1713, and died in 1784. Educated by the Jesuits, he became a bitter enemy of Rome and Catholicism, and led a vagabond kind of life, which was not improved by his marriage (1743). In fact, his domestic life was irregular and unhappy. But, in spite of all, Diderot lived a useful life, and made many important contributions to philosophy and education. His works reveal the marvelous versatility of his mind, consisting, as they do, of translations, stories, plays, essays, philosophical criticism, and original compositions. A list of his chief works is given below. Here must be noticed those which were more or less intimately related to education. The great monument of his career was the *Encyclopédie, ou Dictionnaire raisonné des sciences, des arts et des métiers*, in twenty-eight volumes (1750-1772). This great work provoked the opposition of the Roman Catholic Church, and was suppressed

in 1750. It dared to assume the principle of religious toleration and freedom of speculation, and argued that the principal concern of government was the welfare of the common people. Many of his collaborators, including D'Alembert and Rousseau, deserted him when official support was withdrawn from the enterprise; but Diderot continued its publication in a clandestine manner, writing thousands of the articles himself. His chief contributions to the science of pedagogy were two treatises, entitled *The Systematic Refutation of the Book of Helvetius on Man* (1773), and his *Plan of a University*, written, in 1776, at the request of Catherine II of Russia. In these works the following positions are maintained: (1) Instruction is necessary for all, should be compulsory, and therefore under the direction of the State. (2) The curriculum of secondary instruction (Faculty of Arts) needs to be revised, useless studies dropped, and a better balanced system employed. He severely criticized the traditional system in which (to quote his own words) "not a word on natural history, not a word on real chemistry, very little on the movement and fall of bodies, very few experiments, still less of anatomy, and nothing of geography" is heard. (3) He proposed the following reforms of these "abuses." First, *utility* should be the measure of values in the subjects of schooling. Second, the *sciences* are to be preferred for purposes of teaching. Of the eight divisions in the Faculty of Arts, the first five are devoted to mathematics, mechanics, astronomy, physics, and chemistry. Grammar and the ancient languages are assigned to the last three years. (4) His *Plan of a Russian University* included these further novelties: the division of the classes into several series of parallel courses, scientific and literary, religious, ethical and historical, æsthetic, etc.; history should be taught, beginning with the most recent events and working backwards to antiquity; reading and æsthetic culture must be earnestly studied because they are among the most agreeable and necessary elements of life. In addition to these propositions, it is to the credit of Diderot that he was one of the first to suggest the possibility of teaching the blind through the sense of touch. See his *Letter on the Blind*, in which he showed the dependence of men's ideas on the five senses, and demonstrated the relativity of all knowledge. In the *Letter on Deaf Mutes* he argued that æsthetic study was a valuable aid in promoting that variety of talent and adaptation in which all successful achievement consists. It is plain that these philosophical views reveal all the contradictions of the time struggling with each other. Nevertheless, they prepared the way for the more systematic work of later thinkers. Diderot was not a dogmatist; his gift lay in brilliant and somewhat shallow criticism. He was, as John Morley says, "above all things interested in the life of man, not the abstract life of the race; in the relation of real and concrete motives

in this or that special case." Hence his contributions to the science of education lack the permanence which they might otherwise have acquired. H. D.

**DIESTERWEG, FRIEDRICH ADOLF WILHELM** (1790-1866).—One of the foremost German educators of the nineteenth century; was born at Siegen, Westphalia, and studied mathematics, philosophy, and history at the universities of Herborn and Tübingen. As a private tutor in Mannheim (1814), he attempted to apply Pestalozzi's method of teaching mathematics. Later on (1813), as a teacher of the Frankfurt model school (*Musterschule*), he was largely influenced by De Laspée, Gruner, and other direct disciples of Pestalozzi. In 1818 he took a position at the Latin school in Elberfeld, where he met Wilberg (*q.v.*), a highly inspiring teacher, from whom he learned the secret of the Socratic or heuristic method. It was largely Wilberg's example which induced him to devote his life to the cause of elementary education. In 1820 Diesterweg was appointed as a director of the newly established teachers' seminary at Mörs in the Rhine province. At the head of this institution he passed twelve of the most active and fruitful years of his life. The course of study which he worked out for this school became a model for all other Prussian training schools, and thus shaped the preparation of Prussian teachers for a quarter of a century, being then superseded by a much narrower and less enlightened course. In consequence of the reputation which he had earned in this position, Diesterweg in 1838 was called to a larger field of activity by his appointment as director of the new Berlin Teachers' Seminary (*Königliches Seminar für Stadtschullehrer*). In connection with the seminary he established a practice school, and through this he revolutionized the methods in the Berlin elementary schools.

Diesterweg's activity, however, was by no means confined to his own institution, or to the city in which it was established. He traveled all over the country, addressing teachers everywhere, organized associations of teachers, and published a number of excellent textbooks which introduced new methods of teaching arithmetic, geometry, reading and language, and other subjects. To disseminate his ideas

still more widely, he had established (in 1827) the *Rhenish Journal of Education and Instruction* (*Rheinische Blätter für Erziehung und Unterricht*). For this paper, which he edited until his death, he wrote many articles on the fundamental principles of education, on special methods, and on the necessity of raising the intellectual, social, and economic status of the elementary school teacher.

The cardinal idea of his pedagogy was the principle of self-activity, and he was himself a brilliant exponent of it in practice, as is known from the testimony of some of the teachers whom he trained at Mörs and in Berlin. He insisted on starting with clear sense perceptions, on proceeding from the known to the unknown, and on elaborating general principles through the free mental activity of the child, who was to be the center of instruction, rather than the teacher or the subject. He also strove to emancipate the school from the domination of the Church, advocating expert lay supervision and a free religious instruction, based not on dogma, but on ethical principles. For this reason he was also opposed to denominational schools, which still are the rule in most parts of Germany. It was inevitable that Diesterweg's fearlessness in fighting for these liberal ideas should bring him into conflict with the educational authorities of the State, especially when, after the accession of Frederick William IV in 1840, the party which tried to restrict popular education to the minimum gained the ascendancy. In 1847 he was deposed from his office, although still left in the possession of his salary. His enforced leisure he used for the further propagation of his educational ideas by word and pen. In 1858 he was elected a member of the Prussian legislature, where he untiringly worked for the freedom of the school and for the betterment of the condition of the teacher. His seventy-fifth birthday was celebrated with great enthusiasm by teachers all over Germany; soon after he died at his home in Berlin.

Diesterweg clearly recognized the social function of the school. His ideal aim was the uplifting of the masses of the people through a practical, moral, and religious education. The necessary means to this end was the creation of a real teaching profession, therefore he became a teacher of teachers. He was a follower of Pestalozzi, but, unlike him, he was a practical teacher of rare ability, and thus able to reduce Pestalozzi's theories to workable methods for the classroom. His work for German education may well be compared with that of Horace Mann for American schools. Both were great educational agitators, and both had at times to encounter the most bitter opposition, but while Mann's fame rests chiefly on his ability to organize education and to rouse public opinion in its support, most of Diesterweg's work was of a strictly professional character and of direct influence on the teachers. The best systematic exposition of his ideas is found in his *Weg-*

*weiser für deutsche Lehrer* (*Guide for German Teachers*), published in 1834 in collaboration with a number of other teachers, who wrote some of the parts on special methods. As the best application of his methodology, he himself considered his *Populäre Himmelskunde* (*Popular Astronomy*), Berlin, 1841.

For a complete bibliography of Diesterweg's writings, see the edition of his *Rheinische Blätter* by A. Chr. Jessen in Lindner's *Pädagogische Klassiker*, Vol. VI, Vienna, 1879. F. M.

**DIFFERENCE TONES.** — See **COMBINATION TONES.**

**DIFFERENTIAL CALCULUS.** — See **CALCULUS.**

**DIFFERENTIATION OF FUNCTIONS.** —

In the course of animal evolution special organs have been set apart for the more complete performance of certain particular functions. Thus an organ has been set apart for the reception of light stimulation. This organ, the eye, has been differentiated from the general surface of the body, which is at all times somewhat sensitive to impressions produced by light. In the same fashion the ear has been differentiated from the rest of the body as the organ especially adapted to the reception of sound stimulations. Differentiation of organic functions is advantageous, because it makes possible a higher degree of sensitivity and a higher degree of perfection in each of the differentiated functions. There must, however, be in connection with this differentiation some central organ which shall unify all of the different functions so that they shall cooperate in individual life. Differentiation of functions has taken place during the process of organic evolution, and is not carried further during individual development. The processes of individual development are processes of organization and integration rather than processes of differentiation. C. H. J.

**DIFFERENTIATION OF STUDIES.** —

The process of classifying experience into its

characteristic aspects; the development of the child's knowledge so that it becomes manifest to him as the various school subjects. Sometimes the differentiation, so far as the classification of the curriculum is concerned, is temporary, as in the case of penmanship, which appears with the need to write in the first grade and disappears with approximate mastery in the fifth or sixth school year. Again the differentiation is continuous, appearing whenever certain experiences are felt to be closely related; and further differentiation follows a larger massing of knowledge and the ensuing necessity for further subclassification. Thus, nature study, which is pursued in the lowest school years, is differentiated into geography and elementary science; later, science becomes the physical and biological sciences; and later still biological science becomes botany, zoology, etc.

See CORRELATION; COURSE OF STUDY.

**DIFFUSION.** — The undeveloped nervous system is made up of cells which are devoid of branches. The absence of branches makes it possible for energy to enter and escape from these cells in various directions. The result of this absence of definite paths within the nervous tissues is that the muscles of the body are thrown into irregular and inharmonious contraction by motor impulses coming in all directions from the undeveloped nerve cells. In like manner the sensory impulses which enter into the undeveloped cells become confused and intermingled. The whole situation is described by the term "diffusion." As nerve cells develop definite branches, and as paths of transmission are organized through the nervous tissue, the organism becomes coordinated. (See COÖRDINATION.) Combinations of sensory impulses become regular and precise. The transition from diffusion to coördination is admirably illustrated in the development of the writing habit. At first movements are excessive, distributed over all the muscles of the body, inharmonious, often antagonistic, and utterly confused. As development goes forward, the excessive movements disappear, the inharmonious elements of finger and hand movement disappear, and diffusion gives place to regular, well-defined activities. The same formula applies to sensory experiences. Let one go into a new complex experience. At first the impressions are entangled and confused. There is a mass of conflicting sensations. In the course of time, if experience is allowed to develop, these impressions are organized so that each calls up its appropriate activity and stands in its proper relation to its fellow. Here, again, diffusion gives place to order and organization.

The statement thus far assumes that the nervous system is at some time wholly undeveloped. This is of course not true. Certain centers are wholly undeveloped, but large areas

of the nervous system of all the higher animals are developed through inheritance (see INSTINCTS), consequently absolute diffusion never appears. Even the instincts, however, show a degree of diffusion in their first manifestations.

See COÖRDINATION.

**DIFFUSION OF USEFUL KNOWLEDGE, SOCIETY FOR THE.** — This society arose out of the suggestions of Lord Brougham (*q.v.*), contained in his *Practical Observations upon the Education of the People*, for the encouragement of good reading among the working classes. The aim of the Society, which was organized in 1825 through the efforts of Lord Brougham, was to publish good literature at a price which would bring its volumes within the reach of workmen. The first volume appeared in 1827.

See article on BROUGHAM.

**DIGGES, LEONARD, THE ELDER.** —

One of the leading mathematicians of Queen Elizabeth's reign, who belongs to the gentlemen amateur students of the subject. He was said to be the best "architect" of the age, excellent at fortifications, and to have anticipated the invention of the telescope. He wrote: *A geometrical Practice named Pantometria, divided into three books, Longimetria, Planimetria, and Stercometria, containing Rules manifolde for mensuration of all lines, superficies and solides*, 1571 (edited and finished by his son, Thomas Digges). In this book the theodolite is for the first time described. Thomas Digges, his son, added to his father's writings. His own works (24 volumes in number) are noteworthy as the earliest books in which spherical trigonometry is used in England.

**DIGIT.** — See NUMBERS.

**DIJON, UNIVERSITY OF.** — Founded in 1722 by the then Duke of Bourbon, and sanctioned by Papal bull in 1723. Only a law faculty was maintained. Financial support was given by the faculty, and when the university was suppressed in 1793 it was materially well established. A law school was re-created in 1804, and became a faculty in 1808; faculties of science and letters were established in 1810, and medicine was taught there from 1826. The university was created by the French University Act in 1896. The faculties of law, science, let-

## DILLINGEN

ters, and a preparatory school of medicine and pharmacy are maintained. In 1910 there were enrolled 1015 students, of whom 625 were in the law faculty.

See FRANCE, EDUCATION IX.

**DILLINGEN, THE UNIVERSITY OF, BAVARIA.**—The first of the Catholic universities to be established in the sixteenth century, having been founded by the Bishop of Augsburg in 1549. For a time Dillingen was the intellectual center of Catholic Germany, but gradually declined in importance, until it was finally disbanded in 1803. It has a direct descendant, however, in the Royal Bavarian Lyceum, organized in 1804, which offers a four-year course in Catholic theology. There were 141 students in attendance in 1910.

SPECHT, TH. *Geschichte der ehemaligen Universität Dillingen.* (Freiburg, 1902.)

**DILWORTH, THOMAS.**—An English textbook writer who wrote *A New Guide to the English Tongue*, about 1740, which held a high place in the schools, in which English was taught, for the next half century. The book includes a spelling book of "common and proper words" from one to six syllables, words same in sound and different in signification, a short grammar, a collection of sentences in prose and verse, divine, moral, and historical, together with some short fables; and forms of prayer for children. The whole is designed "for the use of schools in Great Britain, Ireland, and in the several English colonies and plantations abroad." It is dedicated to the promoters of the charity schools of Great Britain and Ireland, by Dilworth, dating from Wapping School, June 13, 1740. There is a list of names and schools of over 100 clergymen and schoolmasters who declare that Dilworth's book is "the best of its kind that hath been made public." It does not seem improbable that Dilworth's book was thus the widest circulated and most remunerative English grammar of the latter half of the eighteenth century. There are rough cuts for the select fables. About 1743 Dilworth followed up his textbooks for English by *The Schoolmaster's Assistant, being a Compendium of Arithmetick both Practical and Theoretical*. This, he says on the title-page, is recommended by eminent mathematicians, "to be used in all schools." It is dedicated to "the reverend and worthy schoolmasters in Great Britain and Ireland," and is designed "to take off" from them "that heavy burden of writing out rules and questions which you have so long laboured under." He has followed the catechetical method of question and answer, "because children can better judge of the force of an answer than follow reason through a chain of consequences." Dilworth includes an *Essay on the Education of Youth*, in which he says that "a year's education in writing is, by many, thought

## DIONYSIUS

enough for girls' education," and this often delayed until eighteen or twenty years of age, and pleaded for girls to go to school as early and stay as long as boys. Over fifty schoolmasters, with names and schools given, recommend this book "as the *only one* for the purpose (*arithmetick*), that hath been made public." Apparently Cocker's *Arithmetick* (*q.v.*) was no longer in use. The rules and examples are given, but there is no rationalized theory of the processes. The multiplication table goes up to nine only. Dilworth also wrote textbooks on the *Terrestrial and Celestial Globes* and the *Young Book-keeper's Assistant*. F. W.

**DINTER, GUSTAV FRIEDRICH** (1760–1831).—A distinguished German clergyman and educator. Born at Borna, Saxony, and educated at the *Fürstenschule* in Grimma, he studied philosophy and theology at the University of Leipzig, and then became pastor of a village near Borna. His interest in education was so great that he took a number of poor but talented young men into his house to train them for teachers, not only giving them free instruction, but also boarding, lodging, and clothing them at his own expense. In 1797 he was appointed principal of a newly established normal school at Dresden with which an elementary school was connected. On account of his health he retired from this position in 1807, and became again a country pastor, without, however, giving up his educational activity. In 1816 he was called to Königsberg as inspector of the schools of the province of Prussia, to which position was added the chair of Pastoral Theology and Morals in the university. Dinter was of great influence on the development of the German elementary school, where he was one of the first to introduce the ideas of the philanthropists and of Pestalozzi. His methods of religious instruction were specially valuable. Among his writings, which have been edited by Wilhelm (43 vols., 1840–1852) the most important are his *Schullehrerbibel* (*Bible for Schoolmasters*), a model of the Socratic method, *Die vorzüglichsten Regeln der Pädagogik* (*Chief Rules of Pedagogy*), and his very interesting *Autobiography*. F. M.

(See portrait, opp. p. 582.)

**DIOCESAN SYSTEM IN EDUCATION.**—See BISHOPS' SCHOOLS; CANON LAW IN EDUCATION; CHURCH SCHOOLS, etc.

**DIONYSIUS.**—Early Christian writer, born in Alexandria about 200 A.D. into a pagan family of wealth and rank. Early in life, after investigating various philosophies, he fell under Christian influences in the catechetical school (*q.v.*) of his native city, which had attained its highest renown under the leadership of its greatest teacher, Origen (*q.v.*), whose most eminent pupil he became. In 232 he succeeded Origen as Director of the Alexandrian School,

filling this position with marked ability for sixteen years, and winning world-wide recognition as the foremost educator of his time. So great was his influence that Athanasius (*q.v.*) described him as "the Teacher of the Church." Alexandria had succeeded Athens as the chief center of learning and philosophy, and had become the battle ground of Christian thought. Its famous library and museum attracted scholars from all over the world. Its catechetical school, founded by Pantænus (*q.v.*), and modeled after the philosophical schools of Greece, had been built up by its great teachers, Clement (*q.v.*) and Origen (*q.v.*), to a position of world-wide influence. They held that all truth is precious, whether gained from Christian or heathen sources, regarded all which had been well said by the Greek philosophers as given by divine revelation, and welcomed their aid in working out the great problems of religious thought. They wore the mantle of the philosopher, and taught the systems of Greek philosophy to their classes, especially the Neo-Platonic, which was dominant in their day. In opposition to the Augustinian view of the transcendence of God, they insisted upon the divine immanence, conceiving of God as indwelling in the world as a spirit dwells in a body. They regarded all life as an education of the soul, and considered culture as closely related to faith. They emphasized the inherent worth of the soul as made in the image of God. Following these lines, Dionysius gave much attention to the condition of the soul after death, and taught the existence of an intermediate state as a school in which departed souls are prepared by an intellectual fire for the heavenly life, thus laying the foundation for the later ideas of purgatory. The Alexandrian School existed for the purpose of instructing adults in all the learning and literature of the past and in the doctrines and usages of Christianity, training clergy and teachers for their work, and preparing believers to meet the arguments of heathen controversialists. Instruction was chiefly catechetical, somewhat after the Socratic method, but was also given in the form of lectures. The curriculum comprised all the elements of general culture, while the Bible and Christian doctrine were made the subject of close and accurate study, in both their theoretical and their practical bearings. From 247 to 265 Dionysius was Bishop of Alexandria, then the greatest and most influential see in Christendom, filling this high position with such rare wisdom, moderation, and fidelity that he has ever since been known as "Dionysius the Great." He took a prominent part in the settlement of all the controversies of his day. He wrote much, but only a few fragments of his controversial works have been preserved, chiefly in the *Ecclesiastical History* of Eusebius. A translation of these may be found in the *Ante-Nicene Fathers*.

**DIOPHANTUS (DIOPHANTOS, sometimes spelled DIOPHANTES).**—The leading algebraist of the Greeks. He seems to have flourished about 250 to 300 A.D., at Alexandria, but these dates are quite uncertain. We know of three works written by him: (1) thirteen books on *Arithmetic*, (2) *On Polygonal Numbers*, (3) *The Porisms*. Of the arithmetic, only six books are extant. It is possible that the treatise on polygonal numbers is one of the original thirteen books of the arithmetic. The *Porisms*, probably a collection of propositions relating to the properties of numbers, is lost. The arithmetic relates almost entirely to indeterminate equations of the second degree (Diophantine equations), although the first book treats of determinate linear equations. Diophantus uses symbols for the various powers of the unknown quantity, the first degree being represented by a symbol resembling the accented final sigma, the second power by  $\delta^2$  (for *δύναμις*, power), the third by  $\kappa^3$  (for *κύβος*, cube), the fourth by  $\delta\delta^3$ , and so on. He used no symbol for addition or subtraction, but used an inverted truncated letter  $\psi$  for subtraction, and occasionally  $\iota$  (for *ἴσος*, equal) for equality. We may therefore consider Diophantus as the earliest writer who devoted a treatise entirely to algebra, as one of the first to use algebraic symbols, as the first to give serious attention to indeterminate equations, and as the only conspicuous algebraist of the Greeks.

**DIOPTRICS.**—That portion of geometrical optics (*q.v.*) which treats of the refraction of light in or between different media. A certain study of dioptrics is valuable as a preparative for a study of the physiology or psychology of vision. According to the reduced eye of Listing, the various refractive media of the eye (cornea, aqueous humor, lens, vitreous humor, etc.) may, so far as their total converging effect is concerned, be considered as equivalent to that of a single substance with a refractive index of 1.35, and a single spherical surface of 5.1248 mm. radius. The distance between the nodal point of such a substance and its principal focus is 15 mm. It is equal to a convex lens with a focal distance of 2 cm.

**DIPHTHERIA.**—A disease of the throat. As shown by modern hygiene, it is a personal disease, and is usually spread by direct contact with another individual who carries the germs. The disease is caused by the diphtheria bacillus. This was discovered microscopically by Klebs, and isolated and proved to be the cause of the disease by Löffler. Hence it is called the Klebs-Löffler bacillus. The incubation period is from two to seven days, usually from two to four days. Infectiousness continues as long as the Klebs-Löffler bacillus remains in the throat or nose, usually from ten to twenty-one days, although sometimes very much longer. The period of isolation for mild cases is perhaps ten days, for severe cases twenty-eight days, and the period of isolation for other members of the family who were removed immediately from contact with the patient is, in New York City, four days. The symptoms of a severe case are headache, fever, general depression of vitality; and a grayish-white membrane is likely to be formed on the tonsils or pharynx. In many cases, however, the symptoms are very slight, and the presence of a serious illness may not be suspected. Before the discovery of the Klebs-Löffler bacillus as the cause of the trouble, the disease was sometimes not carefully differentiated from croup. Probably most cases of so-called membranous croup were cases of diphtheria.

The most important remedy and means of prevention is the subcutaneous injection of the blood serum from an animal rendered artificially immune from the poison of diphtheria. This is the so-called antitoxin of diphtheria, and was discovered in 1894 by Behring, a pupil of Koch. Since the use of the antitoxin has become general, the mortality from diphtheria has decreased remarkably. In Boston the average ratio of mortality from 1876 to 1894, before the use of the antitoxin, was 14.25 per 10,000 of the population. The average ratio since the use of the antitoxin, from 1895 to 1909 inclusive, has been only 5.17. The decrease in mortality is well illustrated by the statistics gathered by Dr. McCollom at the Boston City Hospital.

In the school, diphtheria is a most serious disease, and very difficult to manage. The disease may be spread by means of common drinking cups, exchange of slates, pencils, or other utensils, and perhaps by the dust of the schoolroom; but all these methods are apparently insignificant as compared with the spread by direct contact with another person who carries the disease. Frequently a child who is apparently well may harbor the Klebs-Löffler bacilli in its throat, nose, or naso-pharynx, and the chief danger is likely to come from such cases. There are many slight cases of the

disease which return to school in an infectious condition, or perhaps continue at school all the time. The Klebs-Löffler bacillus may remain in the throat or nose of the patient who has had the disease for a long period after

Per Cent of Mortality of Diphtheria at the Boston City Hospital proper, and at the South Department, from 1888 to 1909, inclusive. Per Cent of Mortality of Intubations for the Same Time. From 1888 to 1894, no Antitoxin. From 1895 to 1909, Antitoxin.

Diphtheria = ————— Intubation = - - - - -

recovery, sometimes for several months; and two cases have been reported where after a year, the bacillus was found.

The disease is more common in cold and temperate climates, and occurs more frequently in the autumn and early winter. The studies of Dr. McCollom, in Boston, show that the disease is much more frequent during the months of the school year than during the vacation months. As regards age incidence, extended investigations by Sir Shirley Murphy, based upon 1903 cases, indicate that the maximum incidence is at the age of four. In the London investigation it was found that diphtheria does not tend to spread in classes under the age of four or over the age of seven. The greatest danger of school spread appeared to be in classes where the children were between their fourth and seventh birthdays. Infants have a relative immunity against the disease, and the blood of older children and adults is supposed to contain an appreciable quantity of antitoxin. The great susceptibility between the ages of four and seven, it has been suggested, is due to the fact that children at birth have a certain immunity acquired from the mother, but this has disappeared by the age of three or four; and then, after seven, there is a relative acquired immunity.

There are many survivals of old ideas in regard to the treatment of diphtheria. It is usually supposed that it is always a severe disease, and hence the great danger that comes

from "carriers" is ignored. Children are often permitted to return after an attack of diphtheria while still carrying the germs of the disease. Especially other well children who have come in contact with cases of diphtheria are likely to be ignored, although carrying the disease. School closure is often resorted to, and the children allowed to return to the school after a few weeks without any examination to prove that they are free from the disease; and great faith is placed in disinfection as a means of protection. This, without bacteriological examination, is of no avail. We disinfect the rooms and the furniture, but the disease germs are in the noses and throats of the children. Disinfection by means of sulphur is described by Dr. Kerr as "a procedure only to be classed with fetichistic incantations and medieval exorcisms." School closure as a means of checking diphtheria is likely to have but little influence; with competent medical inspection it seems better ordinarily to have the schools continued, because in this way the disease can be better controlled than when the children are on the streets and at home. Dr. Kerr in a recent report writes: "It has been shown that school closure ought seldom or never to be necessary in elementary schools owing to the prevalence of diphtheria. With modern technique it is possible to discover those who are spreading the disease, and to obtain their exclusion. The objections to school closure are that the 'carriers' are not discovered and isolated, and that there is not the least guarantee that, at the end of the period of closure, the children who are the cause of the spread of the disease will be innocuous. The closing of schools for diphtheria should be looked upon as a confession of impotence and defeat."

Frequently a number of bacilli morphologically similar to the diphtheria bacillus are found in the throats of children, but according to recent investigations these are nonvirulent, although they may, under certain conditions, cause sore throat. It was noted in the London investigations, that there is a certain relationship between the two organisms, and where diphtheria is most prevalent, the pseudo-diphtheria bacilli are found in greater abundance. The pseudo-diphtheria bacillus is probably, Dr. Kerr concludes, totally distinct from the diphtheria bacillus, but an organism of the same group affected by the same conditions and spreading in the same way from child to child. Although the morphological character of the bacillus is not identical with that of the Klebs-Löffler bacillus, it is difficult to differentiate between them.

Very important and significant studies of diphtheria among school children have been made in London under the direction of Dr. Kerr, the medical officer. The method is as follows: "Diphtheria returns are kept under continuous observation, and on any suspicion of school influence showing itself, my assistant

visits the school, and all children giving any sign of ill health, such as aural or nasal discharge, enlarged glands, undue pallor, or a history of recent absence, have a small portion of mucus removed from throat or nose by a sterilized platinum wire, and placed on the surface of a tube with sterile blood serum. This is then cultivated in an incubator at 98° F. for fifteen to eighteen hours. The cultures are then examined microscopically, and any showing suspicious forms are then stained with Neisser's stain. Except in very rare cases this is deemed sufficient. Only cases showing Klebs-Löffler bacilli are counted as diphtheria; the pseudo-bacilli we neglect." (*Report of the Education Committee*, London, March, 1905, p. 25.) The carriers are then quarantined. For the year 1909 it is reported that "in every instance in which carriers were detected and excluded from the school there was a prompt cessation of cases of diphtheria."

The significant facts in regard to diphtheria are briefly as follows. The disease is usually spread by direct personal contact. The persons who are acutely ill with diphtheria are not the serious sources of contagion; for they are isolated. The most serious sources of contagion are the following: First, the perfectly healthy child who has come in contact with the disease and carries the germs. Second, children who are suffering from mild forms of the disease, not perhaps suspected by parents and teachers. Third, children who have had the disease, but have returned to school while still carrying the Klebs-Löffler bacillus. Daily medical inspection and school nurses to follow up cases in the home are imperatively necessary. And it is important that teachers should cooperate intelligently with medical officers in detecting cases of diphtheria. Any children that have sore throat, even of slight character, or irritating nasal discharge should be reported to the school physician. The only safe method of procedure seems to be the following. As soon as a case breaks out in a school, bacteriological tests of all the children should be made, in order to detect any possible "carriers." In case diphtheria has occurred in a household, all children in the family should be examined bacteriologically before being permitted to reënter the school. Children who have had the disease should not be permitted to return to school until a number of negative cultures has shown that the disease is no longer carried. The problem of dealing with diphtheria in the school is a very difficult one, because the only sure way seems to be the exclusion of all children who are "carriers." But this is likely to be strongly objected to by parents, who see no reason why children who are well should be excluded from the school. The loss of time from school work, however, and the serious character of the disease, and the satisfactory results likely to come from thorough-going investigation and rigorous exclusion of all cases

showing a positive culture, seem thoroughly to justify such drastic measures, and teachers and the community should be educated to the need of a scientific method of handling the disease.

**DIPLOMA.**—Literally, a folded paper (Greek *δίπλωμα*). Originally this consisted of two wax-smearcd tablets, closed and sealed, and conveyed a governmental license, recommendation, or passport. Soon the term came to be applied to all public or legal documents. At present, a diploma is a document conferred by a college, university, or learned or professional body to denote that the holder is entitled to some degree or privilege, for example, to practice law or medicine or pharmacy. Frequently a diploma is conferred by institutions which have not the power to grant degrees as evidence that the holder has attained a certain standard of efficiency in a study or course of studies.

See DEGREES; COLLEGE, AMERICAN; UNIVERSITIES; etc.

**DIRECT HEATING.**—See HEATING AND VENTILATION OF SCHOOL BUILDINGS.

**DIRECT METHODS OF TEACHING.**—In the teaching of desirable facts, judgments, applications, etc., the teacher may have two distinct methods of bringing them into the possession of the pupil: (1) they may be directly given to the pupil, or (2) the pupil may be placed in a situation that will stimulate him to acquire the facts for himself. The first is called a direct method of teaching, or method of instruction; the second is called an indirect method of teaching, or a method of development. Such a classification is made from the standpoint of the teacher's activity. From the point of view of the learning process of the child, the indirect method of teaching is a direct method of learning, since he gains the fact through his own direct experience; and the direct method of teaching is an indirect method of learning, as the child gets the fact not by direct contact, but indirectly through the experience and knowl-

edge of others. The tendency of the past has been in the direction of an overuse of direct methods of teaching, just as certain present reform tendencies tend to the overuse of indirect or developmental methods. The methods are supplemental rather than competitive. Efficiency would seem to demand a large use of indirect methods of teaching; but economy of time and energy, and the necessity for acquiring facts that the child cannot well experience at school, compel the use of the more direct method of instruction. Generally speaking, the indirect method is of greatest use with young children, in the beginning of new subjects, in making generalizations from concrete facts; while the direct method of instruction is most useful with mature pupils, in familiar subjects, and particularly in the domain of physical and moral welfare where the danger of mistake is serious.

The natural sciences lend themselves rather more readily to the method of development than do the normative studies. Nature study, arithmetic, and geography, favor the use of the indirect method of teaching, and history, civics, literature, morals, and the other humanities, lay increased emphasis on the necessity of authoritative instruction. H. S.

See DEVELOPMENTAL METHODS; DIDACTIC METHOD; INSTRUCTION.

**DIRECTORS, SCHOOL.**—A term practically synonymous with School Trustees, when the district or rural school is meant (see DISTRICT BOARDS OF TRUSTEES); or to City Boards of Education (*q.v.*), when referring to city schools. The term Board of School Directors is sometimes used in place of the more common terms, as for example the Boards of School Directors for the school townships of Iowa; the single School Director for the rural school districts of Indiana and Ohio; and the Boards of School Directors for the cities of Milwaukee and New Orleans. When applied to the managing boards of institutions, the term is synonymous with Boards of Governors, Boards of Regents, or Boards of Trustees. E. P. C.

See BOARDS OF GOVERNORS.

**DISAGREEABLENESS.**—This term has come into common use for all emotional and affective experiences which are opposed to pleasure. The necessity of distinguishing between pain and disagreeableness arises out of the fact that pain is a definite form of organic sensation. There are special organs for the reception of pain stimulations, and pain is to be classified as a sensation with pressure and cold and heat rather than with the feelings. The popular contrast between pleasure and pain involves, therefore, a certain confusion in psychological descriptions. Agreeableness and disagreeableness, or pleasure and disagreeableness, constitute the more exact contrast in descriptive terminology.

## DISCIPLINARY CLASSES

See FEELINGS; HEDONISM; PAIN AND PLEASURE.

**DISCIPLINARY CLASSES.** — As the class system of organization in the elementary school becomes perfect, and compulsory attendance forces all children into the schools, numerous maladjusted individuals appear. Some of these are intellectual misfits; some have, through sickness or absence, lost touch with the school; and others present difficulties from the standpoint of discipline. A variety of special or ungraded schools have been organized, into which the above individuals may be fitted. Only occasionally have special schools been set apart for children of a disorderly or semi-incorrigible disposition. These may be dealt with in disciplinary classes, whose educational value consists in their segregating for special treatment, and under teachers specially qualified to deal with them, pupils who are not ordinarily reached by the treatment of the regularly organized classes. On the other hand, they are supposed to contribute much to the efficiency of the regular class, through having withdrawn from this a small percentage of pupils who impose an extraordinary task upon the teacher. There can be no doubt that special teachers can be found who can effectively handle them, and that the educational treatment may be very much better adapted to their needs. But the moral effect of segregating a considerable number of children from the uplifting influence of their fellows is questioned. Disciplinary classes sometimes fall into disfavor in the community, and it may be discovered that the harmful social effects resulting from segregation may outweigh the educational values found in other connections. These classes have been organized, at least experimentally, in nearly all large American cities.

See GRADING AND PROMOTION; SCHOOL MANAGEMENT; INTEREST; RETARDATION; SPECIAL CLASSES; TRUANT SCHOOLS.

**DISCIPLINARY LESSON.** — See LESSON.

**DISCIPLINE.** — The training that results in power, skill, or efficiency in any direction. It is sometimes used in a sense broad enough to cover the whole educative process, so far as that takes the form of systematic training. When mental faculties were recognized as innate, discipline often meant the series of practices through which these supposed innate powers were sharpened and perfected. (See FORMAL DISCIPLINE.) Since training of natural impulses and reactive tendencies involves some transformation of native powers through attachment to ends which they are not spontaneously pursued, the term "discipline" often carries with it a connotation of subduing or restraining natural inclination, and hence of a more or less painful constraint supplied from without. In this sense, the doctrine of disci-

## DISEASES OF THE SENSE ORGANS

pline is opposed to the doctrine of interest (*q.v.*) and freedom. In a more adequate view, this phase of inhibition is seen to be the negative and temporary aspect of a constructive and positive process — the gain of power and efficiency (practical freedom) that ensues from training. There is, however, a regrettable tendency in education to make discipline in its negative sense an end in itself, instead of recognizing that there is genuine discipline only as there is gain in self-control and self-command. In its narrowest pedagogical sense, discipline means the system of rewards and punishments by which pupils are rendered amenable to the teacher's authority. J. D.

**DISCIPLINE, FORMAL.** — See FORMAL DISCIPLINE.

**DISCIPLINE, METHODS OF.** — See SCHOOL MANAGEMENT.

**DISCIPLINE, SCHOOL.** — See SCHOOL MANAGEMENT.

**DISCORD.** — A dissonant combination of tones; the absence of harmony. Discord produces a craving for resolution into something more restful, satisfying, and final. The resolution consists in movement toward combinations of consonant tones. C. E. S.

See CHORD; CONSONANCE.

**DISCOVERY, METHOD OF.** — A term occasionally used for inductive methods of teaching, where the child manipulates his own objects or conducts his own experiments. Sometimes used as a term for the laboratory method of teaching through individual experimentation.

See EXPERIMENT, TEACHING BY; INDUCTIVE METHOD; LABORATORY METHOD.

**DISCRIMINATION.** — In general, this term refers to the ability to hold apart in consciousness two or more elements of experience. Certain types of such ability depend upon the structure and development of organs of sense (see AUDITORY DISCRIMINATION; VISUAL DISCRIMINATION). In other cases, discrimination depends upon high forms of nervous and mental ability.

**DISEASES, PERIOD OF INCUBATION OF.** — See CONTAGIOUS DISEASES.

**DISINFECTANTS FOR SCHOOL BUILDINGS.**—In the first place, a clear distinction between a deodorant and a disinfectant is necessary. Deodorization is the mere neutralization of offensive odors. Disinfection is, on the other hand, the process by which pathogenic germs and infectious material are destroyed, or are rendered inert.

**Natural Disinfection.**—Nature has gratuitously provided a disinfectant of the first order,—direct sunlight is the most economical and practical of all germicides. Schoolrooms which are kept thoroughly clean and receive a thorough sunning each day are not likely to need much further attention in the way of disinfection. Cleanliness and sunshine are worth more than all artificial germicides that can be applied to schoolrooms, save in special emergencies.

**Artificial Disinfection.**—1. *Sulphur Dioxide.*—This powerful disinfectant has a limited use on account of its lack of penetration. When moisture is present, it is very active in surface disinfection, which is often needed in those schoolrooms receiving little or no sunshine. It is easily applied, and the process by which it is generated is a simple one. The room should be tightly closed. A metallic pan or bucket, which can be heated, is partly filled with water and placed in the center of the room. Half immerse a vessel in this water by placing it on some incombustible substance, such as a brick. This last vessel is for the sulphur. Heat the water until it boils, and then set fire to the sulphur. The necessary sulphur dioxide will result. Sulphur dioxide should not be liberated in a room where there is tinted or gilt paper, and all colored maps, charts, etc., should be removed, because it will discolor them.

2. *Formaldehyde.*—Perhaps the most powerful of all the gaseous disinfectants now known is formaldehyde. This material and the methods of applying it are inexpensive. The methods of using this disinfectant recommended by physicians and boards of health, which are practicable in schoolroom disinfection, are as follows. (a) The permanganate method, *i.e.* forming formaldehyde gas by mixing 300 cc. of a 40 per cent solution of formaldehyde with 150 grams of potassium permanganate for each 1000 cubic feet of air space to be disinfected. The atmosphere of the room should be warm, and the room tightly closed. This method can easily be applied in cities, where the necessary chemicals can readily be obtained. An ordinary pan can be used in which to place the materials, and the reaction which follows will free the gas. (b) The Stewart method, which consists in thoroughly spraying the walls, floors, furniture, etc., with a 20 per cent solution of formaldehyde. This is a very effective method, but is more troublesome to apply. In the first of these methods, penetration is not claimed, and in the latter it is not sufficiently proved so that we may rely

upon it wholly. However, if penetration is desired, it can be obtained by using formaldehyde mixed with the vapor of carbolic acid. In this way the tendency to polymerization is entirely destroyed. Dr. W. B. McLaughlin (*Scientific American*, S. No. 1706, Sept. 12, 1908) says, "The mixture which results in the best effects is 75 per cent of a 40 per cent solution of formaldehyde and 25 per cent of carbolic acid—8 ounces of the mixture to 1000 cubic feet of air space." For the floors, door-knobs, handrails, etc., a 40 per cent solution of formaldehyde can be used. In the case of floors, clean sawdust saturated with this solution should be spread over them. This should be swept out before the sawdust becomes dry. This done once every eight weeks will, in general, keep the floors in safe condition. This method is extensively used in Boston at present.

3. *Bichloride of Mercury.*—Great care should be exercised in keeping this poisonous drug in the school building. It is often mistaken, on account of its colorlessness, for something harmless. It should be colored for identification. It can be bought in tablets already colored, each tablet containing a given amount, and from these it is easy to make the proper solution. It can be used in the schoolroom for disinfecting the furniture, floors, and parts of the clothing. For these purposes a 1:1000 solution is sufficient. It must not be brought in contact with metals, for it destroys them. An excess of albuminous substances interferes with its action, and for this reason it is not effective in disinfecting excreta.

For latrines the following will be found effective: (1) chloride of lime—four ounces to the gallon. (2) carbolic acid—5 per cent solution. (3) caustic lime—one part hydrate of lime to eight parts water. (4) mercuric bichloride—1:1000. The foregoing disinfectants are those which are most generally used, and those which are usually recommended by the highest authorities. They will usually be found effective. However, in case that these cannot be obtained, the following may be used: (1) For floors, cretosol—a teacupful to a gallon of warm water. This should be applied before sweeping. (2) For wooden handrails and desks,—a solution of chloride of lime—(teacupful to a gallon of water). Latrines should be flushed frequently, and disinfected with a solution of cretosol of the above strength. In case any article belonging to a child afflicted with an infectious disease cannot be disinfected, it should be burned without delay.

F. B. D.

See CLEANLINESS OF SCHOOLROOM.

**DISINFECTANTS FOR SCHOOL CHILDREN.**—The need of personal disinfection in the schoolroom is much obviated by the free use of pure water, clean towels, and soap. Parents should be urged to send their children to school in a clean condition, as this greatly simplifies

the problems of school hygiene. In case they neglect to do this, we must resort to other methods in order to insure the health of the children.

**Personal Disinfection.** — (a) *The Hands.* — Bichloride of mercury in a 1:1000 solution may be used. This can be purchased in tablet form, which is so prepared that it is easy to make correct proportion. A 2 per cent solution of carbolic acid is also effective. The presence of albuminous or organic substances does not interfere with its action. Biniodid of mercury in a 1:2000 solution is good, and does not injure the skin. (b) *Sore Eyes.* — The disease popularly known as sore eyes is of bacterial origin, and is contracted through the agency of flies, by handling doorknobs and books, and by using towels which are for the public. Children so affected should not be allowed to attend school, because it is a highly contagious disease. A 40 per cent solution of formaldehyde is good for disinfecting doorknobs, books, and towels which have been infected with these germs. (c) *Buccal Secretions.* — In cases of incipient infectious diseases such as diphtheria, whooping-cough, etc., the buccal secretions often carry germs. The mouths of those so affected should be washed with a suitable disinfectant, which can be obtained at any drug store. These secretions, when expectorated or ejected by any other means, from the mouth, should be subjected to a 1:500 solution of formaldehyde.

**DISJUNCTIVE.** — See JUDGMENT.

**DISMISSAL OF TEACHERS.** — See TEACHERS, TENURE OF.

**DISOBEDIENCE.** — See SCHOOL MANAGEMENT.

**DISORDER.** — See SCHOOL MANAGEMENT.

**DISPOSITION.** — Any factor, physiological or psychical, which is capable of influencing new experiences. A disposition may be the result of innate tendencies or of previous experience of the individual. One of the conditions of mental development is that every experience has its influence upon determining the nature of subsequent experience. Every brain process is dependent not only upon the present excitation, but upon former excitations which have left a trace upon the nervous structure. These traces are physiological dispositions. Psychical dispositions may be operative without any explicit awareness of their presence, which is revealed only by scientific analysis. E. H. C.

**DISSENTERS IN EDUCATION.** — In reviewing the course of educational history in England, there is marked, in all ages, a certain educational cleavage originating in religious differences and producing an educational dualism which, on the whole, is characteristic of the race and has been beneficial in its effect, since it supplied and still supplies two sources of energy which have always reacted on and stimulated each other. The history of dissent in education is obscure until about the fourteenth century, although indications point to its existence in the Roman-British period in the period of the survival of British Christianity, and particularly in Wales from very early times. (See HADDON, A. W., and STUBBS, W., *Councils and Ecclesiastical Documents relating to Great Britain and Ireland*, Vol. I, pp. 158, 289, 298, 361, 464.)

The first signs of dissent are the appearance of schoolmasters establishing schools without the episcopal license to teach. That there was some religious meaning in the refusal to grant and the refusal to receive an episcopal license none can doubt. As early as 1170, Pope Alexander III had provided, with respect to both the Gallican and the English Church, that no money should be demanded for a license to teach, even if there were a custom to that effect. This great educational Pope wrote very sternly to Henry de Blois, Bishop of Winchester, upon this subject, and in a general council held at Westminster in the year 1200, a canon to the same effect was passed. Yet a century later (1304) at Beverley and Kelk in Yorkshire (see Mr. A. F. Leach's *Memorials of Beverley Minster*, pp. li-lxv, 42, 48, 58, 102, 114, 169, 293) a desperate attempt was made to teach school "to the prejudice of the liberty of our church" in the teeth of the ecclesiastical courts and to get the common law courts to support the unlicensed teachers. If this happened at Beverley, it must have happened elsewhere; and it is known, in fact, that again, a century later at Gloucester (as recorded in the famous *Gloucester Grammar School Case*, 1400, *Year Book* II Hen. IV, p. 47; text reprinted in *State Intervention in English Education*, Appendix D), the common law courts refused to assist the Church in suppressing unlicensed masters. Meantime, the Lollard movement had taken hold of the land, and dissenting teachers who would not accept an episcopal license had multiplied. In 1393, unlicensed schoolmasters had applied in London in the Mayor's Court for leave to hold school despite an injunction of the Courts Chris-

tian, and the King took no notice of a petition from the Archbishop of Canterbury, the Bishop of London, and others, asking that the secular court should be directed not to meddle with education. The dissenters of that date were, in fact, busy in the work of education, and the fact that Parliament interfered and forbade (2 Hen. IV, c. 15, 1401) "divers false and perverse people of a certain new sect . . . to . . . in any wise hold or exercise schools" did not really check unlicensed education. The Church was seriously alarmed, and the Lollards were persecuted, but apparently with the usual effect of strengthening dissent. A petition presented to the King by the Prince of Wales in 1406 (7 and 8 Hen. IV) prayed that no man or woman might "exercise ascuns escoles d'aseun secte ou doctrine desore en avant encountre les suis delz Foye Catholike, et sacramentz de seinte Eglise" (*Rot. Parl.*, III, p. 584; see A. Abram's *Social England in the Fifteenth Century*, p. 182). The Constitutions of Archbishop Arundel also forbade "masters and all who teach boys and others the arts, or grammar, and that instruct men in the first sciences" to teach strange theology. Educational dissent fulfilled its usual function of stimulating the orthodox party, and the foundation of Eton and other schools and colleges was specifically stated to be "for the extirpation of heresy."

At the Reformation, the more moderate part of Lollardy in an organized form became the Church of England as by law established. The Church was still episcopal, but its ritual and practices were cleaned from many abuses, and the Pope was finally cut off from the national church and from national education. It will be seen directly that the Roman Catholics, who were now in effect one of the dissenting bodies in the State, were destined in their turn to stimulate educational life. But from 1548, when the chantry schools were destroyed, for an entire century, the old episcopal licensing system was employed by the reformed church for the purpose of crushing the educational efforts of dissenters. The bishop's license was still a condition precedent to entrance into the teaching profession, but even in the days of Elizabeth, when educational conformity was enforced with an iron hand, dissenters dared all for the liberty to teach freely. (See ELIZABETHAN PERIOD IN ENGLISH EDUCATION.) Thus on May 1, 1584, a true bill at the Middlesex Sessions was returned against William Smithers of the Parish of St. Botolph's in the liberty of the Charterhouse, London, on the ground that he had for a certain period "doquit, *anglice* kept a common scole in Capell de Charterhouse predict." without the license of the Bishop or ordinary of the diocese (*Middlesex Sessions Rolls*, Vol. I, p. 149). But the licensing system, though strictly enforced by Parliament (*Statute 1, doc. 1, c. 4, 38*), by the Established Church (see the canons of 1604), by the Bishops (*q.v.*) and by the courts, did not before the Commonwealth

attain the height of intolerance that came with the Restoration of Charles II, in 1660.

The enforcing of educational conformity with a vigor worthy of Archbishop Arundel in his campaign against the Lollards was foreshadowed by Laud, but the conformity acts of 1662 and 1665 exceeded even the Laudian promise. The reason is not far to seek. During the period of the Commonwealth, the Church of England, as well as the Church of Rome, had become a church in dissent from a non-episcopalian establishment. The extreme section of the Lollard movement had at last attained supreme power in Church and State in England and (by special legislation) in Wales (see the Commonwealth Acts of 1649: text in *State Intervention in English Education*, pp. 101-104). Charles II in his *Declaration concerning Ecclesiastical Affairs* (London, 1660, p. 13) directed the ministers of every parish carefully to instruct the children of the parish, and a general revival of parochial education seemed likely. But the act of 1662 showed the forces of reaction in full activity. Every tutor and schoolmaster, public or private, in the land was to subscribe a declaration of conformity to the liturgy as by law established, while if a schoolmaster taught as a private teacher without a license, he was to be imprisoned for three months. The House of Lords in vain remonstrated against the declaration of conformity; the Commons insisted on it. The Act of Conformity was followed by the Five Mile Act of 1665, which forbade dissenters to teach in any public or private school under a penalty of £40. Archbishop Sheldon enforced this act with a pertinacity and a vigor worthy of a nobler cause. Two centuries of enfeebled education were the results of this reaction from the policy of the Commonwealth. But action and reaction are equal and opposite, and before long the dissenters of all types discovered methods of evading the legislation of 1662 and 1665. The first and most obvious method was an appeal to the courts of law, the most faithful servants of freedom known to the Constitution. As early as 1670 one way out of educational prosecution was discovered; in *William Bates' Case* it was held the nominee of a founder or of a lay patron of a school could not be ejected by the bishop for teaching without license. The courts also held that when there is a civil remedy a suit in the ecclesiastical courts will not lie (*Chedwick v. Hughes*, *Carthew's Reports*, p. 464, *anno* 1699). While in *Cox's Case* (*Peere Williams' Reports*, Vol. I, p. 79, 1700) the Lord Keeper actually held that there was not and never had been any ecclesiastical jurisdiction over any schools save grammar schools, no jurisdiction in fact over elementary education, in *Re v. Douse* (Lord Raymond's *Reports*, Vol. I, p. 672, 1701) it was held that elementary schools did not come within the statute (*Jac. I, c. 4*) that made a bishop's license necessary at common law. Thus elementary education was free from the

control of Church and State alike. It is plain that this fact gave the dissenters a new freedom, and, long before this, juries were refusing to convict dissenters charged with unlicensed teaching (see *Middlesex Sessions Rolls*, Vol. IV, p. 41, etc.). But dissenters did something other than gain their freedom through the courts. They showed by definite action how necessary they were to national education. In 1674 a definite and direct effort was made by the leading dissenters to obtain ameliorative legislation. Baxter (*q.v.*) and Tillotson drew up a Healing Bill, and though the bishops would not accept it, yet the legislation between dissent and Church made it impossible for the latter to insist on its full legal rights to suppress all teaching by dissenters. The joint action of the Church and dissent in 1674 in forming a trust to found schools and distribute religious literature in Wales also tended to make the position of the dissenters (many of whom had been ejected from their livings under the establishment on St. Bartholomew's Day, 1662) more possible.

The work done by the dissenters in endowing schools between 1674 and 1685 was very great, but their crowning work was the part that they played in starting the great charity school movement (*q.v.*). It seems almost certain that the Roman Catholic dissenters were the authors of the earliest stage of the charity school movement. King James II of course looked with favor on any Roman Catholic movement, but he could not assist one dissenting body in preference to another, and so the freedom to open schools that he gave to the Jesuits in and about London was also extended to the Presbyterian body. Three instances of Roman Catholic elementary schools in London are found about this time: "a crafty Jesuit, who in the year 1685 erected a free school in the suburbs of London" aroused the efforts of Dr. Tenison (then vicar of St. Martin's in the Fields), who erected a free school in Castle Street "for the education of divers poor boys of his parish, in opposition to that of the Jesuit" (Maitland's *London*). Here there is a direct instance of dissent stimulating the Establishment into new activity. Again, it is known that on May 3, 1686, James II (in pursuance of his prerogative power) issued a license to Edward Selater of Putney to keep school and instruct youth (see Gotch's *Collectanea Curiosa*, Vol. I, pp. 290-293). The third instance of a Jesuit school is found in Wilkinson's *Londina Illustrata* (Vol. I, p. 137), in a full account of the famous Zoar Street Gravel Lane Charity School. While in central London the Jesuits stimulated the Church, in south London they stimulated the Presbyterian dissenters. By 1756 dissenting schools in London had considerably increased. The Presbyterians had schools at Bartholomew's Close, Fry's Court Tower Hall, Ratcliffe Highway, Shakespeare's Walk, Shadwell, and the Gravel Lane Southwark School. The Independents had schools in Keat's Street, Spittlefields, King's Head Court,

Spittlefields, and Vincom Yard, Horsleydown. The one Quaker school was at Bridewell Walk, Clerkenwell. The dissenters attacked with a certain measure of success the poorest districts. Something like one twelfth of the charity school children in London were educated by the dissenters (and one tenth, if we only reckon boys) by the middle of the eighteenth century.

It is about this time that there are beginning to be seen signs of the educational dawn. A new educational ideal seems to come simultaneously into the minds of Church and dissent. The Sunday schools, which were started in 1763, and were consolidated into a system by Robert Raikes (*q.v.*) of Gloucester in 1780, were taken up by the dissenters at least as vigorously as by the Establishment. In 1834 there were in England and Wales a million and a half of Sunday scholars, with 160,000 teachers. The awakening educational rivalry of the dissenters and Church people, however, found a new source of activity in the monitorial school system almost simultaneously started by Andrew Bell (*q.v.*) and Joseph Lancaster (*q.v.*). Bell's schools in 1811 were taken over by the National Society (*q.v.*), and before Bell's death (1832) they numbered over 12,000. Lancaster's system, controlled from the famous school and training college in the Borough Road (*q.v.*), was taken over in 1808 or thereabouts by the Committee which in 1814 became the British and Foreign School Society (*q.v.*). These societies became identified respectively with the Tory and the Whig parties, and were important factors in the long political movement which in modern times has very largely identified dissent or nonconformists with the Whigs or Liberal party, and the Church with the Tory or Conservative party. When Parliament at last, in 1833, began to make educational grants, the schools of both societies were the objects of these grants. It was a "British" school, that at Bethnal Green, which first secured a grant in 1836 for general school purposes on the ground of the extreme poverty of the district. In 1839 the Committee of Council on Education was formed, and the societies were intrusted with a grant for the erection of model schools. Until 1870 the system of voluntary schools was the only system that secured help from the State, and, as the national schools far outnumbered the British schools, it may be said, speaking broadly, that until that date the schools of the Established Church still held the chief place in the elementary educational system of the country.

The Education Act of 1870 created a new position, for it established side by side with the voluntary system a system of rate built and supported schools, which also received the government grant. The schools were severely handicapped in the struggle for existence, but that very fact stimulated Church efforts for education, and despite the fact that the introduction of compulsory education in 1876 was followed by

## DISSOCIATION

free (elementary) education in 1891, these schools until 1902 managed to retain about half the children of the country. The schools provided out of the rates were and are undenominational in character, though Christianity of an undenominational type is taught in them, while the Church schools teach specifically Church doctrine. The noneconformists or dissenters have identified themselves with the movement for the universal extension of undenominational teaching in all public elementary schools during school hours, while Churchmen claim that the parochial church schools, which have for so long borne the burden of education in both rural and urban areas, should still continue to give (subject to the conscience clause which was common before and universal since 1870) Church teaching to the children of Church people, despite the fact that under the Education Act of 1902 all public elementary schools, whether voluntary or provided by a local authority, are maintained out of the rates combined with grants from the Board of Education. This dispute is still in progress, and there is much to be said for both sides. Dissenters complain that in country parishes, where there is only a Church school, the children of dissenters are liable to be infected by the clerical atmosphere, while Churchmen complain that in the undenominational schools the children of Church people are liable to be infected by the less definite religious atmosphere of such schools. The ancient dualism in education is in fact still operating, and, despite the many evils that arise from the bitterness of the conflict, there is still the ancient benefit of mutual stimulation. In the matter of education, however, the Established Church is no longer the controlling authority. But the point to be noted is that whatever the changes have been, there has always been a determination to retain in education a definite Christian character, and this determination has remained quite unaffected by the efforts made since 1850 to secure a system of purely secular education.

See ENGLAND, EDUCATION IN.

**DISSOCIATION.** — This term is the direct antithesis to "association." Association is to be described as the process by which mental states are organized into complex wholes. The converse process by which organized mental processes are broken down into their elements is described by the term "dissociation." Pathological cases of dissociation appear in insanity where the individual loses the intelligence which he had through the combination of earlier experiences. Temporary forms of dissociation appear in amnesia of different forms. The term serves very well to express the disintegrating character of all abnormalities, since these abnormalities depend upon the breaking down of organizations.

See ABNORMAL; AMNESIA; ASSOCIATION.

**DISSONANCE.** — See CONSONANCE.

## DISTRICT BOARDS OF TRUSTEES

**DISTINCTNESS.** — When an object of experience is sharply cut off from all other objects of experience, it is said to be distinct. Attention (*q.v.*) to objects renders them distinct.

See CLEARNESS; VIVIDNESS.

**DISTRACTION.** — See ATTENTION.

**DISTRIBUTION.** — See TERMS.

**DISTRICT BOARDS OF TRUSTEES.** — A board having charge of the school or schools of a district. Also known as the School Committee and Board of Directors, or School Directors. A board of much importance in sparsely settled regions; but in the more thickly settled states there is a tendency to diminish the importance of such boards by transferring their functions to other school authorities, and to cut down their membership. Many functions formerly given to district boards of trustees have been transferred, within recent years, to county superintendents, county boards of education, or state boards of education, or fixed for the state as a whole by general state law.

The common form of the district board in the West is a board of three trustees, one elected each year and for three-year terms. Sometimes the election takes place in the annual school meeting, but more commonly by ballot at an annual school election, held on a day fixed by the general school law and uniform throughout the state. In the Southern states the tendency is to reduce the board to a membership of one and the district to a subdistrict, and to delegate to this one trustee only relatively unimportant functions. In Indiana and Ohio, where the township system prevails, the same is true of the one school trustee elected annually by the people of the district. In New England the district has been abandoned for the town unit of school administration. In Kentucky a recent and a significant reform has been accomplished, by which the number of trustees has been reduced from three to one for each district, the districts have been reduced from full districts to sub-districts, and the sub-districts have been organized into groups, or divisions. (See articles on KENTUCKY, STATE OF; DIVISION SYSTEM.) The division board, composed of the trustees of each subdistrict, controls the schools of the division, or group, subject to the oversight of the county board of education. A similar system has also been introduced into Tennessee. In Alabama the reverse of this process has recently taken place, the township system of organization being abandoned for the Western system of three trustees for each school district, though the trustee was almost completely shorn of all power.

In states where the county system of school administration (*q.v.*) prevails, the district trustee is merely an agent of the county board of education, and has little power.

These boards of school trustees, as is so frequently urged, undoubtedly represent the feelings and wishes of their districts. The argument that they are institutions which are close to the people is in most cases a strong one. This is, however, both their strength and their weakness. The schools must frequently take a position in advance of the people, and their ability to do so is often seriously impeded by unintelligent boards of district trustees. There is little business in a rural district which could not be transacted as well by one man as by three, and the difficulty of finding three good men to manage a school, for every teacher employed, is indeed great. In Illinois, for example, about 33,000 school trustees are required to conduct the school business of the rural and ungraded schools of the state, which employ about 12,000 teachers, with a cost for maintenance of about \$500,000 each year; while in the City of Chicago twenty-one men look after the school affairs of a school system employing over 6000 teachers, and costing, for maintenance only, over \$8,000,000 a year. The system of district management is ultra-conservative and educationally inefficient; the trustees frequently assume authority over matters of which they are relatively ignorant; and almost all progress in school administration and efficiency, in so far as it relates to rural schools, has been made without the support and often against the opposition of the district school authorities. Various means have been adopted to improve the situation from within by improving the rural school trustee, but without success. A trustee day at the county institute has been set apart, in many places, but the attendance in most cases has been small. Perhaps the most significant movement, if existing boards of trustees are to be retained, has been that of Pennsylvania and certain states in the Northwest (North Dakota, South Dakota, Minnesota, Wisconsin), where annual conventions of trustees must be called by the county superintendent for the discussion of matters relating to the welfare of the schools. Attendance of trustees is compulsory, and mileage and a *per diem* is paid for attendance.

E. P. C.

See articles on the different state school systems, as ALABAMA, ARKANSAS, CALIFORNIA, etc., for further and more detailed information as to the number, method of election, and powers and duties of district boards of trustees; see also, DISTRICT SYSTEM for the historical account.

**DISTRICT MEETING.**— A meeting of the resident legal voters of the school district, called to elect officers and to transact business, or to decide matters of local importance. In a number of states women have been declared legal voters at school meetings. The annual district meeting is a regular feature of a number of states, where it has done good service in the past in the education of the people in the forms of self-government. The authority of the district meeting is to-day greatly restricted, and in the newer states it has little power, except in matters relating to building, moving the school-house, or directing the course of district litigation. Even in these matters, it can only direct the trustees of the district how to act. In the older states its powers are greater. Everywhere, however, its powers have been decreased from what they originally were, and the functions it once exercised have been transferred to its officers or to township, town, or county school officials, or to the state. The annual district meeting is in but a few states still competent to decide who shall be employed to teach the school, this being now in the hands of the district officers, or, under the county system, in the hands of the county board of education; while the selection of textbooks and the prescribing of what shall be taught is now generally decided by the state.

Much has been said both for and against the district school meeting. Under primitive conditions, when the belief in the public schools was weak, the meeting did its greatest service. It was suited, too, to rural conditions. On the other hand, it was inefficient, inconsistent, and unprogressive as a means of administration, and many fierce animosities were engendered over matters too trifling to merit a meeting for consideration, and the efficiency and usefulness of the schools were seriously impaired by those factional disturbances. The decline of the school meeting as an institution set in years ago, the states finding it necessary to deprive district meetings of their authority and to impose requirements as to taxation, term, teachers, and instruction in order to secure reasonably satisfactory conditions and progress. Efficient school administration has been promoted in proportion as the importance of the district meeting has been minimized. E. P. C.

**DISTRICT OF COLUMBIA.**— The Federal district on the Potomac River, in which the capital of the United States has been located since 1800. The total population of the district in 1910 was 331,069. Of its population in 1900 31.1 per cent were of the negro race, and 10.2 per cent were foreign born. Germans, Irish, and English together comprised 75 per cent of the foreign born. The percentage of illiterates in the population of 1900 was 1.6 per cent for the

white people, and 24.3 per cent for the negroes. The population includes many officials who are only temporary residents of Washington, and who have little interest in a good educational system for the district. City charters were granted by Congress to Washington, Georgetown, and Alexandria, the affairs of the district being under the immediate control of Congress. In 1862 the affairs of the district were placed under the control of the Secretary of the Interior. In 1873 the district was organized as a territory, but the next year the territorial form of government was abolished, and the immediate control of the district was given to a board of three Commissioners, appointed by the President, with the concurrence of the Senate. This form of government has since continued, and the Board of Education for the district reports annually to these Commissioners.

**Educational History.** — The schools of Washington owe their origin to "An Act to establish and endow a permanent institution for the education of youth in the city of Washington," enacted by the City Council, on Dec. 15, 1801. This created a board of thirteen school trustees, seven of whom were to be appointed by the council, and six to be chosen from among those who had contributed to their support, one vote being given for each ten dollars contributed. Thomas Jefferson, having contributed \$200, was elected one of the six, and also the first President of the new Board of Trustees. An elaborate plan for a system of public instruction was drawn up, to extend from the common schools to and through a college and a university. At first only elementary instruction was to be provided. Two schools were opened near the close of the year 1805, but in 1809 these two schools were merged into one. In 1816 two boards of trustees were created to manage the two schools then in existence, after the district plan, one of seven for the Eastern School, and one of seven for the Western School. In 1811 a Lancasterian (see LANCASTER, JOSEPH) school was opened in Georgetown, under the control of the trustees of the Georgetown Free School, and continued under this management until 1842, when this board was supplanted by a Board of Guardians, appointed to manage the schools of the city. The first school in the District to which girls were admitted was established in Georgetown in 1812, and a year or two later a similar school was opened in Wash-

ington. From 1805 to 1844 has been termed the charity, or pauper school, period of the schools of Washington. The act of 1801 gave the trustees a maximum of \$1500 annually from the proceeds of the tax on slaves, dogs, and various forms of licenses, which, with tuition fees and contributions, made up the available revenue. Between 1812 and 1838 Congress, in response to numerous appeals for aid, passed fourteen joint resolutions authorizing lotteries for the benefit of a fund for schools. Tuition charges

were at first levied on all who could pay, and those who paid were given advanced instruction not open to indigent and charity pupils. In 1820 the schools were declared to be exclusively of the charity type, and no pay pupils were to be received. In 1831 only the children of parents having an income of less than \$1.50 per day, or the children of parents having more than four children, were to be admitted to the schools. In 1840 only 1200 of the city's 5000 white children were in attendance at any school, and these were provided with the poorest of buildings, books, and teachers. Only a few private schools existed for the negro children of the city. The pauper school idea took deep root in the District, and it was not until some time after the Civil War that any proper conception of the importance of free public education came to be generally held.

The period from 1865 to 1890 was a period of organization and reorganization, during which partial harmony and unity were secured, and the school system was rounded out. In 1861 the first modern school building (a ten-room building) was begun; in 1868 instruction in drawing was introduced; in 1869 a Superintendent of Schools was appointed; in 1870 a preparatory high school for colored students was organized; in 1873 a normal school for white students was established; in 1876 the first high school for girls, and in 1877 the first high school for boys, were organized; in 1879 the normal school for colored students, organized in 1876, was incorporated into the school system of the District; in 1880 the two high schools were merged to form the Central High School for boys and girls, and in 1882 the high school course was extended from two to three years; in 1880 supervising principalships were created; in 1886 entrance examinations to the high schools were abolished; in 1890 two branch high schools were organized; in 1891 the colored high school was definitely established and became known as the M Street School; in 1892 the high school course was extended to four years; in 1896 a Director of High Schools was appointed; in 1901 the business courses, organized in 1889, were separated, and a business high school organized, and the McKinley Manual Training High School was opened; in 1902 the Armstrong Manual Training High School for colored students was opened; and in 1903 medical inspection was provided by the District Commissioners.

The management of the schools has also changed during this time. The consolidation of the two boards of trustees of Washington in 1844 was the first step toward an unification which is as yet incomplete. This board and the board for colored schools increased in size by the increase in wards, until they numbered forty-one by 1873, when they were reduced by law to nineteen, the board for white schools being reduced from twenty to eight, and that for colored schools from twenty-one to eleven.

The next year the four boards of trustees of the District, viz., the board for white and the board for colored schools in Washington, the Georgetown board, and the board of trustees for country schools were all abolished, and all of the schools of the district, white and colored, were consolidated under one management in the form of a Board of Trustees for the Schools of the District of Columbia, composed of nineteen members, eleven elected from the city of Washington, three from Georgetown, and five from the country districts. In 1882 this board was further reduced to nine. In 1895 two women were added, making the number eleven. In 1900 this Board of Trustees was abolished, and a new Board of Education of seven members was created, to be appointed by the Commissioners of the District of Columbia, for, after the first arrangement, seven-year terms. A partial unification of white and colored schools was also secured by subordinating the superintendent of colored schools to the superintendent of white schools. In 1906, after a prolonged hearing, following a stormy period of six years, another new Board of Education was created, to consist of nine members, three of whom shall be women, and three of whom shall be of the colored race. They are to be appointed by the Justices of the Supreme Court, for three-year terms, after the first apportionment of terms to insure one third retiring each year.

**Present School System.**—This Board of Education of nine members, created by the act of 1906, has a nominal control of the schools of the District. They report to the Commissioners of the District of Columbia, who are the Council, the Mayor, and the Board of Apportionment and Revenue all in one, but secure their appropriations from Congress, which is the real Board of Education for the District. All salaries and all important expenditures must be fixed by Congressional legislation. The new Board of Education is to determine all questions of general educational policy, and to appoint its executive officers. The Superintendent of Schools is appointed for a three-year term, and has control of the educational work of the District. He recommends, since 1906 for the first time, all teachers, principals, and supervisors, for appointment, promotion, and dismissal by the board. He is assisted by one Assistant Superintendent for white schools; one Assistant Superintendent for colored schools; one Director of Intermediate Instruction in white schools; a Supervisor of Manual Training; directors of drawing, physical culture, music, domestic science, domestic art, primary instruction, kindergartens, and night schools; and thirteen supervising principals.

The schools of the District are grouped into thirteen divisions, nine of which include the white schools and four the colored schools. Each group consists of from eight to twelve school buildings, and is in charge of a supervising principal. The school system for whites consists

of a normal school, five high schools, and eighty-seven elementary schools. The school system for colored pupils consists of a normal school, two high schools, and forty-four elementary schools. The school system employed, in 1908-1909, forty-three supervisory officers, 1583 teachers in day schools, and 95 teachers in evening schools; 113 of the day school teachers were employed in kindergartens and 235 in the high schools. In addition to these there is a Special school for Backward and Atypical Children for each race; the Kendall School for deaf and dumb of the white race, and the Colored Institute for the same class of the other race; and two industrial reform schools, one for boys and the other for girls.

The business affairs of the board are handled by the Commissioners of the District of Columbia, who control schoolhouse plans, repairs, purchases of every kind, salary adjustments, and, in some respects, even rules and regulations. The term "Board of Education" is a misnomer, for the board is without power, and is little more than a board of school visitors. Courts and Commissioners may review its decisions; treasury officials revise its estimates; and the board has no authority to make a single purchase. The board has no treasurer, auditor, business manager, architect, funds, or property. Its one non-educational officer is a secretary, who is also a member of the District Supply Commission, and acts as intermediary between the board and the Commissioners. Requests for funds are made by the Board of Education to the Commissioners of the District of Columbia, who pass on them and embody such requests as they approve in their estimate of funds needed to conduct the affairs of the District. One half of the expenses of the District come from a district tax, the other half from Congressional appropriations. This estimate is then submitted to Congress, and referred to the proper committees of the two houses; and Congress grants what it sees fit. Progress under this plan is relatively slow, and the facility with which Congress can reconstruct the school system, as a part of the annual appropriation bill, makes interference easy and a continuous policy almost an impossibility. The salaries for teachers and supervisors, as established by Congress, are relatively small, — those for the more important positions very small, — and the appropriations for new buildings are inadequate to provide for the growth of the city. The recent report of the School House Commission, created by the act of 1906, revealed many poor and antiquated buildings, and a very inadequate material equipment.

The confusion existing is hardly credible. Authority and responsibility are hopelessly tied up with red tape. The bureau methods in use are entirely inadequate to the task. An attempt is made to manage a large city school system by small town methods, and the result is disastrous. Educational conditions in Wash-

## DISTRICT OF COLUMBIA

ington, from an administrative point of view, are among the worst to be found in any city in the Union, and the school system is behind that of cities elsewhere of equal size. The corps of superintendents is entirely inadequate, and there is no power to administer remedies or to standardize instruction and equipment. Until Congress can be made to realize that it is incompetent properly to administer such an undertaking, and will give to the Board of Education the power and control which should belong to it, there is little hope of a good, modern school system for the District of Columbia. The superintendency of the schools of Washington is generally regarded as one of the most difficult and most undesirable positions in the United States.

The total cost for maintenance alone in 1908-1909 was \$1,711,422. About two thirds of the total receipts for all educational purposes came from Congressional appropriations, the other third from district taxation. The schools of the District have no income from permanent funds. The Washington School Fund, which was derived from the lotteries authorized by Congress between 1812 and 1838, and which in 1881 amounted to \$70,630.47, was appropriated by Congress, at that time, to build the Washington (now Central) High School building. This was finally consented to in order to overcome the objections of certain members of Congress to spending public money for secondary education. The total expenditure for schools in 1908-1909 was equal to 29 cents per pupil in average daily attendance per day, and \$51.24 per year. In amount (72 cents) which each adult male must contribute to provide \$1. Washington ranks with the New England states, or the more wealthy states of the West, and this small amount produced the large sum of \$35.21 for each child, from five to eighteen years of age. The percentage of the school population, from five to eighteen years enrolled (77.51 per cent), and the percentage of the school enrollment in average daily attendance (80.72 per cent) are both high, though the District had no compulsory education law until 1906. A nine months' school term is provided.

*Higher Education.*—The nation maintains two institutions of collegiate rank in the District of Columbia. — Gallaudet College, for the deaf and dumb, established in 1864; and Howard University (*q.v.*), a college for the negro race, established in 1867. Besides these national schools, the following institutions of higher learning exist in the district:—

INSTITUTION	YEAR OF OPENING	CONTROL	FOR
Georgetown University . . . . .	1789	R. C.	Men
George Washington University	1821	Nonsecularian	Both sexes
St. John's College . . . . .	1870	R. C.	Men
Catholic University of America	1889	R. C.	Men
Trinity College . . . . .	1900	R. C.	Women

## DISTRICT SCHOOL INSPECTOR

In addition other institutions, national in their scope of influence and educational in their nature, are located in the national capital. Most important of these are the Carnegie Institution for the Advancement of Learning (*q.v.*) and the Smithsonian Institution. Similarly the various bureaus of the National Government, such as the Geological Survey, Bureau of Ethnology, various bureaus of the Department of Agriculture, and the Library of Congress (*q.v.*), have become educational institutions of great importance. These are discussed under the caption NATIONAL GOVERNMENT AND EDUCATION.

Many efforts have been made during the past forty years to establish in Washington a great national university but so far no bill looking to that end has succeeded in securing the approval of Congress. (See NATIONAL UNIVERSITY.)

**DISTRICT SCHOOL.**—A term applied to the elementary or common school maintained in the rural school districts of the state. To-day more generally spoken of as the rural school.

See DISTRICT BOARDS OF TRUSTEES; DISTRICT MEETING; DISTRICT SYSTEM.

**DISTRICT SCHOOL INSPECTOR.**—A new official, now in the process of evolution, and of rather uncertain future. The appointment of such an officer has come from a feeling of need of some form of supervision for rural schools, and particularly of graded schools which receive state grants for compliance with certain improved conditions. In Minnesota the official is known as a State Inspector of Graded Schools; in Illinois he is known as Rural School Inspector. In Minnesota it is the duty of this officer to inspect all graded elementary schools to see if they comply with the conditions of the law for state aid, while in Illinois the official is a deputy from the office of the state Superintendent of Public Instruction,

who inspects and approves schools which meet certain conditions as to building, equipment, and teacher, and designates them as standard rural schools. The state agents employed for so long by Massachusetts and Connecticut were in a certain sense state inspectors of rural schools. A few other states have appointed such an officer, but his work and position are as yet uncertain. If a satisfactory system of county school supervision could be provided, there would be relatively small need of such a state official, and the present weakness of county supervision is the actuating cause of the appointment of these inspectors.

E. P. C.

**DISTRICT SCHOOL JOURNAL.** — See JOURNALISM, EDUCATIONAL.

**DISTRICT SYSTEM.** — By this is meant a form of educational organization under which the school district is the unit of organization, conducting its affairs without much oversight or control from any higher authority, except such oversight as is given by the county superintendent of schools, or the county board of education, if such a body exists, acting under the general school laws of the state. Under the district system local organization and control is at a maximum, and central control are at a minimum. The district-system forms of organization which prevail in Arkansas and Illinois are good examples of the district system of control. The town system, as seen in Massachusetts; the township system, as seen in Indiana; the division system, as seen in Kentucky; and the county system, as seen in Florida and Louisiana, are examples of a progressively more centralized system of school organization, with a view to securing greater educational efficiency.

(See separate articles on these different systems, under the proper headings. Also see the articles on DISTRICT BOARDS OF TRUSTEES, and on DISTRICT MEETING.)

The rise of the district system, historically, is of much interest. In the original New England colonies the town was the unit of both church and civil government. In Massachusetts by 1700 as many as twenty separate parishes had been created within the eighty towns then existing, and the number increased rapidly during the next half century. Each parish possessed full civil machinery for carrying out the religious purpose, — the parish meeting, clerk, constable, and assessors, — and the parish meeting soon became a center for the discussion of parish interests other than those of the church, and for the rise of democracy and for the assertion of parish or district rights. This greatly accelerated the movement toward decentralization. The democratic desire for local control and for maximum benefits from all taxes paid led to still other demands. The division of the town into districts for the repair of highways, with sur-

veyors for each, soon came about, and after 1725 definite surveyors' districts existed generally in the towns. Such districts gradually became smaller in area, as well as more clearly defined. Some towns also were divided into districts for recruiting the militia, and constables and assessors were elected for different parts of the town. All of these influences tended toward the growth of district consciousness as opposed to town consciousness, and to the development of the civil and democratic consciousness as opposed to the earlier religious government of the town.

The rise of the dame school (*q.v.*) in these parishes in the summer, and the presence of the private school taught by a master in the winter, provided a more convenient means of instruction than the central town school afforded. As the town schools in nearly all cases were supported in part by the rate-bill or tuition fees, this local support of dame and private schools tended materially to reduce the available funds for the maintenance of the town school. As the laws of the colonies required the maintenance of schools, and the central authorities were insistent that the provisions of the laws should be carried out, and as the fines for failure to comply were almost sufficient to pay a master, it became necessary for the towns to decrease, and finally entirely to abolish the tuition charge, and to maintain the town school wholly by a general tax levied on the property of the whole town. This was the opportunity of the parishes, or districts, and the price of the consent of the outer parishes to the town tax rate was the division of the town school. (See DIVIDED SCHOOL.) The practical wisdom of these democratic parish meetings now asserted itself, and the moving town school, by which the town school was carried to all of the parts of the town, in rotation, or the establishment of additional town schools, or both, was the result. The date for the attainment of this stage in the evolution of the district school may be placed as in the first quarter of the eighteenth century, and from this time until the latter half of the eighteenth century, when the district organization was authorized generally by law and given full legal standing, the evolution of the district school out of the moving school was going on. The evolution took different lines in different towns, but the final result was much the same in all.

In some towns the location of the school was changed from year to year, schoolhouses to accommodate it were built from time to time, and school centers or districts were thus gradually established. In other towns the school moved about each year, being held in each center at first an arbitrary number of weeks, and later a number of weeks proportional to the amount of school tax paid by the center, this latter leading to the final apportionment to each district by the town of the money paid in school taxes by each center or district. Schoolhouses were also built in the districts from time to time,

as in the case above, and the district school organization thus became fixed. Thus the parish, section, or road district gradually evolved into the school district as well, and district school officials, to take charge of the new district schools, were added to the other parish officers.

The evolution is traced in the articles on the several states, especially those on Connecticut and Massachusetts. The Massachusetts laws of 1642 and 1647, relating to the maintenance of schools by the towns, applied, but in 1805 the towns were empowered to subdivide into school districts; in 1827 district committees of one for each district were directed to be appointed by the towns; in 1829 the power to appoint was delegated to the districts, the district committees might consist of three residents, and these committees were given power to select teachers, provide board and fuel, and supervise the schools. Maine did not separate from Massachusetts until 1820, but the first school law of the new state definitely adopted the Massachusetts district system. In Rhode Island the district organization was begun

Apparatus and equipment of the district school as it was.

shortly after it was in Connecticut. The districts were known as "squadrons," and the district authorities were given entire control of their schools, schoolhouses, and school lands, the employment of teachers, and the management of the schools. In Vermont the first school law in 1782 empowered the towns to form districts and to elect trustees, who were to hold property, establish schools, and build schoolhouses. The towns were permitted to alter the boundaries of districts and to create new ones, but otherwise the districts were practically independent of the towns. The first New York school law of 1795 provided for town organization, with the supervision and direction of the schools placed under three to seven town school commissioners, elected by the people of the towns, and with two or more district trustees, elected by the people of the districts, who should confer and advise with the town school commissioners. This law expired by limitation in 1800, and on the revival of the school system in 1812 the district organization, with three

trustees for each, was definitely established, and to these trustees was confided the care and the supervision of the schools of the district. By 1827 the district system had superseded the town system throughout New England, and was generally in use elsewhere.

New England settlers moving to what was then the West carried the district system with them. Though Congress, in the Ordinance of 1787, had paved the way for the township system, and though the earliest school laws in Indiana and Michigan provided for a township form of organization, the district system was soon adopted as better suited to the conditions and needs of the time. Ohio definitely adopted the district system in 1824, Illinois in 1825, Indiana in 1833, and Michigan in 1837, and the system gradually extended into the West and South, and is to-day common in the North Central and Western divisions. It was suited to the earlier conditions, when population was sparse, intercourse limited, communication difficult, and isolation the rule, and also to the earlier conception of the nature and purpose of education. Under modern conditions it is unsatisfactory, wasteful, and unintelligent in action, and in a number of states it has been modified in the interests of better educational administration. (See articles on CONSOLIDATION OF SCHOOLS; COUNTY SYSTEM; DIVISION SYSTEM; TOWN SYSTEM; TOWNSHIP SYSTEM.)

The struggle to control and to subordinate the district system has been a long and a bitter one. To some it has seemed that its curtailment or abolition meant the curtailment or abolition of all local liberty. Much patriotic eloquence has been poured forth in defense of the system, and natural centralizing tendencies have been pictured as striking at the very foundations of American life. As a system of school administration, though, the district system has gradually outlived its usefulness in all except remote regions, and almost everywhere its powers have been curtailed or modified by the creation of new supervisory agencies, and not infrequently it has been abolished, in whole or in large part, by the creation of the town, township, division, or county systems. The struggle began in 1853 in Massachusetts, but the old town system was not finally restored until 1882. In 1853 town school committees were empowered to abolish the districts, but in 1857 this law was repealed. In 1859 the district system was abolished throughout the state, but in the autumn of that year a special session of the legislature repealed the law. In 1869 the district system was again abolished, but in 1870 any town, by a two thirds vote, was permitted to return to the system. In 1882 the system was finally abolished throughout the state, after all the larger towns had voluntarily abandoned it, and since 1882 the town system of school management has everywhere prevailed. Connecticut began the process in 1865, but it was not completed until 1909, many of the smaller and

poorer towns still clinging to the district system, though its abolition was frequently recommended and attempted. In Rhode Island, where permission to abolish the district system was granted to the towns at a somewhat late date, the process was completed in 1893. Maine abolished the district system in 1893. New Hampshire granted the towns permission to return to the town system in 1870, and in 1885 entirely abolished the district system. Vermont granted similar permission in 1870; in 1884, required all towns to vote on the question; and, in 1892, abolished the district system except in the case of specially incorporated town districts. In Indiana the new school law of 1852, following the new constitution of 1851, provided for the township system and reduced the school districts to subdistricts with little power. The county system of the South has long been in use, and the division system of Kentucky has only recently been worked out; but both have for their purpose the reduction of the power and the importance of the school districts. The rise of the county superintendency in the Central, Western, and Southern states, with frequently the adoption of a modified form of the county system of government, with the consequent transference of functions from the districts to the county superintendents and to county boards of education, has also done much to weaken the district system and to deprive district authorities of many of their former powers. **DITTES, FRIEDRICH** (1829–1896). — Born at Iriersgrün, Saxony, he received his training at the teachers' seminary in Plauen; later on prepared himself for the University of Leipzig, where he studied philosophy, mathematics, and natural science, and received the doctor's degree in 1860. In the meantime he had been engaged as teacher in various schools, and now became the subrector of the realschule in Chemnitz. Here, at a teachers' convention in 1864, he delivered an address which caused a reorganization of the Saxony elementary and normal schools. The next year he was appointed director of the seminary at Gotha and inspector of the schools of the duchy. A new period in Dittes's life began when he was called, in 1868, as director to the Vienna *Pädagogium*, a newly established institution of a unique character, not a training school, but a school of pedagogy, intended for the higher education of teachers already in office. In this position, which he filled until his retirement in 1881, he

exerted great influence on the development of the Austrian elementary schools, and fought vigorously for the emancipation of the school from the Church. In 1874 he was elected to the Austrian parliament, where he brilliantly defended the liberal Austrian school law of 1869 against the attacks of the clerical party. After his retirement he devoted himself to editing his educational review, *Pädagogium*, which he had established in 1878. Many of his writings were in opposition to the theories of Herbart and Ziller, his own pedagogical theory being based on the psychology of Beneke (*q.v.*). His chief works are *Grundriss der Erziehungs- und Unterrichtslehre (Outline of the Theory of Education and Instruction)*, 1868; *Geschichte der Erziehung (History of Education)*, 1870; and *Schule der Pädagogik*, 1875. **DIVERGENT ASSOCIATION.** — Whenever an experience is made the center of a whole series of suggestions which lead the mind away from the original experience, especially if this leading of the mind away from the central issue does not contribute to the development of a single system of experience, the association is called divergent. Thus if the appearance of a person suggests to the mind of an observer a large number of other persons who are in no wise related to each other, but are suggested by the person now under observation, the impression may be regarded as a center of divergent association. Divergent association is a type of distraction which may have the appearance of organized mental activity. Thus children in the schools very frequently have their attention drawn to so many different phases of an object that instead of building up a coherent system of ideas they are distracted through the divergent associations suggested to them.

See ASSOCIATION; ATTENTION.

**DIVIDED SCHOOL.** — That form of the New England town school, which, in the evolution of local school administration, came between the moving school (*q.v.*) and the district school (*q.v.*). It was a school which existed in two or more parts with two or more teachers, each teaching in different sections of the town, and with each pupil attending school in only one place. Yet the sense of unity was so strong that it was managed through the town meeting or the school committee in the interests of the town as a whole, and was regarded as one school. The same conditions which produced the moving school operated to bring about the divided school (the former never having existed in some towns), but with these in addition: (1) desire for longer terms of school for each section than could be secured through the moving school; (2) willingness to pay increased town rates to obtain this benefit; and (3), in some cases, isolation

of certain sections or a widely scattered population, which prevented children from attending school in more than one section. The divided school existed generally throughout New England during the last three quarters of the eighteenth century, and in many different forms. During that time it passed through a process of evolution caused by the development, in a population growing more dense, of the tendencies which produced it. This evolution consisted of four submovements: (1) toward definite bounds between the sections; (2) toward one teacher for each section; (3) toward the right of each section to the benefits of all the money paid by its inhabitants for the support of the school; (4) toward definite and direct control by each section of the school through its representative upon the school committee. When these four submovements were completed in any town, the school district virtually existed in its crude form, and the divided school was at an end.

**DIVINITY SCHOOL OF THE PROTESTANT EPISCOPAL CHURCH, PHILADELPHIA, PA.**—An institution founded in 1862 for the training of candidates for the ministry. Any person who has been admitted a candidate for Holy Orders, is admitted to the school, provided also he has the necessary collegiate training or its equivalent. A course of three years is provided. Graduates of the school or other theological seminary, holding the degree in arts of a university or college, are admitted to the graduate courses which lead to the degrees of Bachelor of Divinity and Doctor of Divinity. There is a faculty of seven professors and instructors.

**DIVISION.**—The fourth of the four fundamental operations, as now usually considered. Various names have been given to the operation, but "partition" and "division" have been the favorites. The former was common in the early Italian books, and those which appeared under the Italian and Spanish influence. Thus we find it in the Treviso arithmetic (1478), and in the works of Ortega (1512), Ghaligai (1521), Savonne (1563), and Santa Cruz (1594). The Dutch-French work of Wentzel has *Devisio: dat is declinge, Diuisio: e' esta dire, partic.* Thus "partition" was used by the vernacular writers as exactly synonymous with "division." The Latin writers often preferred the other term, as is seen in the works of Huswirt (1501), Scheubel (1545), Stifel (1544), and Ramus (1555). Many of the more scholarly writers used both terms, as is shown by the works of Paciolo (1494), Tartaglia

(1556), Clavius (1585), and Baker (1568). The use of the term "partition" to indicate only the division of a concrete by an abstract number, as distinct from "measuring," which is the division of one concrete number by another, is not warranted by any extensive history.

The definition of the operation has given much trouble. Early writers generally defined it as the operation of finding how many times the divisor is contained in the dividend, as in Hylles (1600):—

"Diuisio doth search how oft the diuisor  
 In Diuidend may be quoted or found  
 Whereof the quotient is the decidor."

This definition is open to the objection that  $7 \div 3 = 2\frac{1}{3}$ , and that " $2\frac{1}{3}$  times" is meaningless according to the primitive use of the word "times." It also fails to provide for the case of  $\$10 \div 2 = \$5$ , where the quotient is hardly to be called "times." A second definition that has met with some favor states that division is the finding of a third number that is contained as many times in the dividend as unity is contained in the divisor. This appears in the Treviso arithmetic of 1478, and goes back at least to Maximus Planudes (c. 1330); but it is open to the second objection already mentioned. A third definition speaks of division as the finding of a number that has to 1 the same ratio that the dividend has to the divisor. This is used by writers like Huswirt (1501), Cataneo (1546), Scheubel (1545), Stifel (1544), and Peletier (1549). The most usable definition describes division as the process by which, given the product of two numbers and one of them, the other is found. This allows for forms like the following:  $\$10 \div \$5 = 2$ ,  $\$10 \div 2 = \$5$ ,  $\frac{2}{3} \div \frac{1}{3} = \frac{2}{1}$ , and so on. Strangely enough, this seems to be the oldest definition of all, and to have been used in ancient Egypt. The terms used in division are merely abbreviated translations of Latin expressions. *Numerus diuidendus* means simply "number to be divided," and this has been shortened to "dividend." In the same way *Numerus diuisor*, "the dividing number," has been abbreviated to "divisor." The result of a division was formerly called merely the answer, the issue, the result, or some similar name. Thus we have in the commentary on Boethius by Clichtoveus (1510) *Tertius est numerus ex divisione proueniens, and hic est quercendus, or the quoliens.* The Latin writers often spoke of the result as the "how many?" From this comes our word "quotient." The twofold nature of division is represented by these cases:  $\$10 \div 2 = \$5$ , and  $\$10 \div \$5 = 2$ . These were noticed as early as 1526 by Rudolff, and very likely still earlier.

The operation of division is the most difficult of the four common ones, and has always been so considered. There have been many devices and arrangements of the figures, and of these a few will be given. The Egyptian of the time

## DIVISION

of Ahmes (*q.v.*), say 3600 years ago, would have divided 19 by 8 as here shown, only he would have used different figures. (See 1 8 NOTATION.) He would have stated the result as  $2 + \frac{1}{4} + \frac{1}{8}$ , while we should give it as  $2\frac{3}{8}$ . The most common of the early forms was division *per colona*, i.e. by the use of the products stated in the columns of the extensive multiplication tables used by the merchants, or by the help of memorized products. Tartaglia (1556) speaks of this as "per colona, ouer di testa, ouer per discorso, ouer per toletta . . . aregolo, ouer alla dritta, ouer tauoletta." The Treviso (1478) arithmetic arranges the work of  $7624 \div 2$  as follows:

Lo partitore 2. 7624 | 0 lauanzo  
 La parte           3812 |  
*I.e.*  $7624 \div 2 = 3812$ , and 0 remainder.

A complementary plan was used by Gerbert (c. 1000), as follows:  $900 \div 8 = 900 \div (10 - 2) =$

$$10 - 2) 900 \quad ( 90 + 18 + 3 + 1 + \frac{1}{2} = 112\frac{1}{2}$$

$$\begin{array}{r} 900 - 180 \\ \hline 180 \\ 180 - 36 \\ \hline 36 \\ 30 - 6 \\ \hline 6 + 6 = 12 \\ 10 - 2 \\ \hline 2 + 2 = 4, \frac{4}{8} = \frac{1}{2} \end{array}$$

The arrangement of this work was not as given above, but as is here shown:—

c	x	1 2 8
9	8	
1	2	4
1	1	2
1	9	2
1	1	2

Another method, common in the later Middle Ages, was the division by factors, *per re-piego*, as the Italians called it. Thus, to divide

## DIVISION

216 by 24, first divide by 8 and then divide by 3. The most common of the early methods is that known as the galley, batello, or scratch method. It is probably of Hindu origin, and its history can be fairly well traced from the early stages. The name comes from the fact that the array of figures resembles a galley or boat (*batello*). In England it was sometimes called the scratch method, because the figures were scratched out. It is illustrated by the following from the first printed arithmetic (Treviso, 1478):—

Upon this method Maximus Planudes (c. 1330) throws some light. It is, he says, "very difficult to perform on paper, with ink, but it naturally lends itself to the sand abacus." (See ABACUS.) "The necessity for erasing certain numbers, and writing others in their places, gives rise to much confusion where ink is used; but on the sand table it is easy to erase numbers with the fingers and to write others in their places."

Our present method of long division is a matter of slow growth. Traces are found in Persia in the fourteenth century, and about the same time Maximus Planudes gives what he calls an Arab method, which is analogous to ours. It appears in Italian manuscripts of the fifteenth century in the form here shown, this being a facsimile of a Florentine solution of about 1450. It first appeared in print in Calandri's arithmetic, which was printed at Florence in 1491, in the form shown in the following illustration. It was not until the eighteenth century that this form entirely replaced the old galley method.

<p><b>Parti</b> 5349 &gt; per 83</p> <p><b>Uicenne</b> 5349 &gt; — 83 00644 — <math>\frac{24}{83}</math></p> $\begin{array}{r} 534 \\ 498 \\ \hline 369 \\ 33\sim \\ \hline 33\sim \\ 33\sim \\ \hline 48 \\ \hline 0 \end{array}$ <p style="text-align: right;">183</p>	<p><b>Parti</b> <math>\frac{1}{3}</math> p 60</p> <p><math>\frac{1}{3}</math> — 60 0 <math>\frac{2}{3}</math> / <math>\frac{20}{3}</math> 0 <math>\frac{3}{380}</math></p> <p><b>Uicenne</b> <math>\frac{1}{160}</math></p>	<p><b>Parti</b> 13 &gt; <math>\frac{1}{2}</math> p 12</p> <p>13 &gt; <math>\frac{1}{2}</math> — 12 13 &gt; <math>\frac{1}{2}</math> / <math>\frac{1}{12}</math></p> <p><b>Uicenne</b> 11 <math>\frac{11}{12}</math></p>
<p><b>Parti</b> 60 p <math>\frac{1}{8}</math></p> <p>60 — <math>\frac{1}{8}</math> 480</p> <p><b>Uicenne</b> 160</p>	<p><b>Parti</b> <math>\frac{2}{7}</math> p <math>\frac{2}{3}</math></p> <p><math>\frac{2}{7}</math> — <math>\frac{2}{3}</math> <math>\frac{2}{7}</math> / <math>\frac{2}{3}</math></p> <p><b>Uicenne</b> 0 <math>\frac{1}{3}</math></p>	<p style="text-align: right;">12</p>

At present two methods are recognized, the modern names being "short division" and "long division." In the latter the quotient is coming to be written over the dividend because of the ease of determining where to place the decimal point. In short division it is the custom to place the quotient below on account of ease in writing and in performing several successive divisions. Some writers place it above, because this is done in long division, but the argument is not a cogent one, and the effort to change the custom of the world is not likely to succeed for such a trivial reason.

D. E. S.

**DIVISION SYSTEM.** — A system of school organization as exemplified in Kentucky (*q.v.*), which the school districts of each county are grouped into a number of divisions (in Kentucky, four, six, or eight), and the schools of each division are controlled by a division board. In the evolution of a centralized system, the Kentucky plan is a halfway stage between the district system of Arkansas or Kansas and the county system of Louisiana or Florida. A similar form of organization is to be found in Tennessee.

E. P. C.

**DIZZINESS.** — A form of sensation which

arises through the excessive stimulation of the semicircular canals. The semicircular canals are a part of the ear, in no way connected with the function of hearing, but constituting rather the organ of equilibration. When this organ is excessively stimulated, either through pathological conditions within the organ or through a violent movement of the body as a whole, a peculiar and intense form of sensation arises which is described by the term "dizziness."

**DOANE COLLEGE, CRETE, NEB.** — A coeducational institution, which was the outgrowth of the Crete Academy, a preparatory school organized in 1871. Doane College, the center of Congregational education in Nebraska, has four other academies in the state from which it draws students. The government is vested in a self-perpetuating Board of Trustees, who serve three years, but are eligible for reelection; three quarters of the twenty-seven members of this board must be members of Congregational churches. Besides the usual undergraduate courses and the academy, departments are maintained in music, elocution, and art. There are no college fraternities. Grounds, buildings, and equipment were valued (1906) at \$127,640; the total annual income is \$28,013. The average salary of a professor is \$990. The instructing staff numbers (1909) twenty-seven, including the teachers in the academy; of this number seven are full professors. There was in 1910-1911 an enrollment of 247 students in all departments.

C. G.

**DOCENT.** — Literally a teacher or instructor (Latin *docere*). In this country the term is employed in Chicago and Clark Universities with special meaning. At Chicago it refers to a position higher than that of fellow, while at Clark the position of docent is the highest annual appointment, an "honor reserved for men whose work has already marked a distinct advance beyond the doctorate, and who wish to engage in research." The time of the docents is mainly devoted to study and research, although they are also expected to do some teaching. Those found worthy may be given the *licentia docendi*, in which case the position may be said to correspond to a "brevet collegiate professorship."

In Germany the term is synonymous with *Privatdocent*, or university instructor below the rank of professor. To become a private docent, a candidate must have obtained the doctorate and proved his qualifications for academic work by *Habilitationsleistungen*, which consist of a scientific research, oral examination, and trial lecture before the faculty in which the candidate desires to qualify. Usually three years must elapse between graduation and recognition by the university as private docent. The position carries with it the *venia docendi*, the use of university rooms for lectures, and an

announcement of lectures in the university catalogue, but no salary except in rare cases. The docent charges fees, and the number of students whom he can attract depends entirely on his merits and ability. Accordingly some of the best work in the German universities is performed by the docents, more particularly as they are not hampered by the restrictions of an official position. (See FREEDOM OF TEACHING.) The professors are generally recruited from the ranks of the private docents.

**DOCILITY.**—The capacity for learning, in its widest sense. Royce, who uses the term to denote one of the fundamental characteristics of mind, defines it thus: "By the docility of an animal we mean the capacity shown in its acts to adjust these acts not merely to a present situation, but to the relation between this present situation and what has occurred in the former life of this organism." This capacity, together with sensitivity (*q.v.*) and initiative (*q.v.*) differentiates conscious from nonconscious organisms, and these three capacities constitute the signs of mind. On the physical side docility is conditioned by the plasticity of the nervous system by means of which any brain process is more likely to recur the more frequently it has been performed (law of habit, *q.v.*). On the mental side traces are always to be found of the influence of former experience. The former experience may be either explicitly reproduced in consciousness (memory, *q.v.*), or it may have been so completely organized that it becomes effective without any explicit awareness of its presence. It may be added that the teacher is under peculiar temptation to overestimate the importance of docility, or tractable willingness of the pupil to accommodate himself to the ideas of textbook or teacher, at the expense of the other two factors mentioned. E. H. C.

**DOCK, CHRISTOPHER** (1698–1771).—A schoolmaster reputed to have published the first professional book in America on education. He was born in Germany about 1698, came to America (probably) in 1718, and opened a school among the Mennonites near Philadelphia. His *Schulordnung* was written in 1750, but not printed until twenty years later. He died in Philadelphia in 1771. W. S. M.

**DOCTOR.** (Latin *docere* to teach).—This term originally meant nothing more than teacher, and was used in the early period of the universities interchangeably with *professor* and *magister*. It was not, however, in common use before the middle of the twelfth century. Irnerius (*q.v.*), for example, is never given that title. The University of Paris conferred the title of doctor on Peter the Lombard and Gilbert de la Porrée at that period (1145). As the universities began to assume some form of organization, these terms of address became titles which could only be assumed after definite periods of study and with the permission of the proper authorities, the guilds or faculties composed of those already holding the titles. At first the universities differed somewhat in the use of the terms *doctor*, *magister*, and *professor*. Thus at Bologna the common titles were *doctor*, *professor*, or *dominus*, *magister* being rarely used. The jurists, it is true, attempted to arrogate the doctorate to themselves, but without success. At Paris *magister* was the title most commonly used in the faculties of theology, medicine, and arts, *professor* came next, and *doctor* was rare. This practice prevailed in other universities modeled on Paris. At Oxford the doctorate was retained for the superior faculties of theology, law, and medicine, and the title of *magister* for arts and grammar. The degree of doctor spread generally in the sixteenth century, and has survived in Germany, where the degrees of Doctor of Philosophy and Master of Arts are conferred simultaneously. In France the doctorate is the third degree (after baccalaureate and licentiate); in the English universities it comes after the bachelor's and master's degrees, except in the case of the Mus. Doc., which is equivalent to a master's degree in other faculties. The same statement is true of the American universities. The tendency in England and America has been to differentiate the doctorate according to faculties; this is brought out in the article on degrees (*q.v.*). The degree is also used for conferment by universities as marks of honor, and attempts are being made to differentiate between doctorate degrees conferred in course and *honoris causa*.

**DOMESTIC ART.** — See **HOUSEHOLD ARTS.**

**DOMESTIC ECONOMY.** — A term until recently much in use to indicate the formal study of household activities, but now generally replaced by the term Household Arts (*q.v.*). One of the earliest examples of the use of this term appears to be 1778, in Robertson's *Hist. Amer.* I, IV, 320. "The functions in Domestic Economy are many, which fall to the share of women" (*New English Dictionary*). As a term used to denote an educational subject, it is found in the title of a volume by Miss Catherine Esther Beecher, *Treatise on Domestic Economy for the use of young ladies at home and at school* (Boston, 1812). The term "Department of Domestic Economy" is found in *A Special Report on Industrial Education in the United States, 1883*, by Mrs. Mary B. Welsh (United States Bureau of Education, 1883, p. 278). Mrs. Welsh says of this work in Iowa State College: "The first instruction in this department was given in 1872." Later, the department included instruction in cookery, house furnishing, care of the sick, care of children, management of help, dress, physiology, and "domestic chemistry." (See *The Home Economics Movement*, Bevier and Usher, Boston, 1906.) This term was used by the New York Industrial Education Association in 1885, and covered all branches of household work as then taught in its school. This term has passed out of common use in this country in educational work.

In England, the term "domestic economy" has been discontinued since 1904, in favor of "domestic subjects." *Économique domestique* is used in France and Belgium in the lower schools.

**DOMINICANS AND EDUCATION.** — The Dominicans from the beginning (1216) have been devoted to study and to the work of education. St. Dominic (1170-1221) desired to gather about him companions whose principal aim should be the salvation of souls through the ministry of the Word, and his order is officially designated The Order of Friars Preachers. Apostolic work demanded learning; hence Dominic (1215) conducted his first six followers to Toulouse to attend the lectures of a celebrated professor of theology

named Alexander. The system of studies and of graduation observed in the order has been noticed by the historians of educational movements (see Drane, Douais, Vaughan). After completing the arts (classics) course, the student began the course of philosophy and theology. The most promising students were sent to a *Studium Generale*, the old laws requiring that each student be provided with three books, a Bible, the *Book of Sentences* of Peter Lombard (d. 1160), and a history, probably that of Peter Comestor.

At first there was but one *Studium Generale*, that of Paris. By 1248 four others were established, at Cologne, Oxford, Montpellier, and Bologna. The *Studia* were multiplied in the course of time, to suit the growing needs of the order. B. Albertus Magnus, St. Thomas Aquinas, and Peter of Tarentasia (afterwards Pope Innocent V) collaborated in framing a system of studies and of graduation which has been preserved substantially to the present time. The regulations adopted called for a long course of studies, frequent examinations, and successful teaching, as the candidate passed from the baccalaureate and licentiate to the degree of Doctor in Theology. This system produced a body of men well equipped for "the ministry of the Word," and well prepared to fill the chairs left vacant in the University of Paris, in the year 1228, when the masters of the university, in consequence of a collision between the civic and academic authorities, withdrew from the city. After a long controversy, in which William of St. Amour denied the right of the friars to occupy university chairs, St. Thomas and St. Bonaventure defending the claims of the religious, Alexander IV pronounced in favor of the "regulars." From this period dates the world-wide educational influence of the Dominicans and Franciscans. Their influence was exerted principally in the field of ecclesiastical studies, a term which includes philosophy, theology, Scripture, canon law, church history, and subsidiary branches, especially the science of languages.

Albertus Magnus (*q.v.*) (1193-1280) and his pupil, Thomas Aquinas (*q.v.*) (1226-1274), were the most renowned scholars and educators of the Dominican Order. Succeeding St. Thomas, and formed in his school, there came a host of Dominicans, known as "Thomists," prominent in educational work from the thirteenth century down to the twentieth, with a marked weakening of effort during the ravages caused by the French Revolution. Their activities were exercised, first in the University of Paris, Cologne, and Bologna, afterwards in other universities of Europe, notably at Oxford, Dublin, and Louvain. In the universities and in many seminaries they filled important chairs, often forming a majority of the professors. Outside of the classrooms they exerted a powerful influence by their writings, numbering in the thousands, which cover all depart-

ments of knowledge (see Quéfif-Échard, *Scriptores Ord. Praed.*). In the departments of philosophy and theology there is an uninterrupted series of writers, amongst whom the following are the best known: Cajetan, Ferraricensis (commentaries of these two published in Leonine edition of St. Thomas' works), Capreolus, St. Antoninus, Francis of Vittoria, Medina, De Medicis, Dominic Soto, Peter Soto, Melchior Cano, Bannez, John of St. Thomas, Gonet, Contenson, Porrecta, Gatti, Gotti, Billuart, Goudin, Gonzalez, Zigliara, Lepidi, Dummermuth, Hugon, Pègues (the last six belong to the nineteenth century).
